Knowing Me, Knowing You is a flawed book but I had to start somewhere in my efforts to develop a truly integrated approach to the behavioural sciences. I don't know that, if I were at the starting point again with the insights I have now, I would mix self-help certainties with scientific exploration and postulation.

Having said that, I do think *Knowing Me, Knowing You,* as Sara has indicated, is a very valuable step forward in the direction of aligning and integrating the behavioural sciences. And it does work as a self-help book for 2nd Tier thinking which can handle the elements of paradox and uncertainty the book leaves hanging for further exploration.

Constructive criticism is helpful in honing and refining a work. I will certainly take forward Sara's points (and those others offer) into the eventual update of *Knowing Me, Knowing You*.

In the meantime, I believe it's one hell of a starting point! I hope it gives us some new key points of reference and that others will join with me in developing and expanding the framework.

My thanks to Sara for her many words of encouragement and to Jonathan Reams for the opportunity to present these views here.

Book Review

Leadership Agility.
Five Levels of Mastery for Anticipating and Initiating Change.

Bill Joiner & Stephen Josephs. 2007. San Francisco: Jossey-Bass

Reviewed by Jonathan Reams

There it is, right on the first page of the introduction in big letters – "An Integral Approach." For those of us who have been engaged in learning about and trying to make use of the integral paradigm for a while this phrase can be loaded with expectations. Will this book make it into the mainstream of the field (leadership development) or will the integral message be marginalized and relegated to a few devotees? Will it stay true to our particular conception of integral, or will it frame integral in its own way? These and a host of other questions could arise from reading through the beginning of Joiner and Josephs' book.

For me, an added allure of the book is that it is in my field of study, leadership. Being familiar with many of the challenges present in attempting to bring new and useful distinctions to the discourse in the field, I was curious to see if Joiner and Josephs could do something beyond what was already present in the literature. I was also curious to see if they could communicate an integral approach to leadership development in a clear and accessible way.

On almost all accounts, I found that the authors succeeded in meeting the challenge. Their book is clearly written, well organized, and full of useful stories that illustrate the distinctions they make. It is the distinctions they make and how they organize them that make the book work so well. The structure they provide guides the reader through the five levels of mastery they delineate in a way that makes very clear how each level grows from the previous ones. The big question introduced at the beginning is, Is the approach integral? My view is yes, and this review intends to show why, as well as point to a couple of weaker areas.

What they say

To begin, one of the ever-present issues I encounter when providing authors feedback on their submissions is the need for more context setting. Situating the readers is critical if you wish to have them on the same page with you as you take them on the journey you wish to describe. Joiner and Josephs do this very well. Their introduction clearly sets the stage for what is to come by framing the approach they take, describing some of the journey they took to get there, and being explicit about how to make best use of the sections of the book. They lay out how they see an integral approach by saying that they approach the stages or levels of leadership agility development from both the outside in and the inside out. The outside in involves skill development, focused on three areas: pivotal conversations, team initiatives and organizational initiatives. The inside out involves mental and emotional capacities that enable the above mentioned skills to develop. With these simple distinctions they define the integral territory they will cover.

SOME RIGHTS RESERVED

Then, in part one they define and illustrate the core competency of leadership agility upon which they base the book. This first pass through the territory does three key things. First, it situates leadership agility in the context of the ever-increasing complexity of the situations leaders encounter in organizations. It briefly describes the five levels of leadership agility; expert, achiever, catalyst, co-creator and synergist. Second, they tell one story, about Ed, a composite character who responds to a situation in five different ways, each illustrating one of the levels of leadership agility. Third, they lay out four core competencies that further define leadership agility. The four are: context-setting agility, stakeholder agility, creative agility, and self-leadership agility. Two capacities comprise each core competency. For context setting agility, they are situational awareness and sense of purpose. For stakeholder agility, they are stakeholder understanding and power style. For creative agility, they are connective awareness and reflective judgment. For self-leadership agility, they are self-awareness and developmental motivation. Finally, they show how each level is undergirded by awareness and intent.

The second part of the book devotes one full chapter to each of the five levels of leadership agility. This is the meat of the book, where the authors go into depth to show the nuances, differences and distinctions present at each level. Each chapter uses three or more case studies to illustrate the various aspects of leadership agility at each level. Each chapter is structured in a similar manner, showing what leadership means to people operating at that level, how they perform in the three areas of pivotal conversations, team leadership and organizational leadership. Then they go into how these cases illustrate the eight capacities forming the four competencies at each level.

The third section of the book discusses how to apply all of this in becoming a more agile leader. A chapter on assessing leadership agility is followed by one on developing it. This is initially done through a set of answers to frequently asked questions about their model, then shifts to describing aspects of growing into a new level of agility, straddling between two levels, and issues of downshifting. They briefly describe to individual readers how to assess their own current level; an example helps to illustrate how to do this. The second chapter in this section discusses how readers might set developmental goals, both within their current level of agility and in developing a new level. This is illustrated by weaving a story through the discussion, which focuses on the power of reflective action. It closes with an analysis of how this story relates to the levels of awareness and intent at the core of the process, and a further story of the power of attentional practice.

Kudos and questions

I was quite impressed with the ability of Joiner and Josephs to so clearly communicate the often-times challenging complexities of understanding developmental stages. I have come to appreciate the ability to make distinctions. There are many to make, and ones that sometimes matter most are often those that are the hardest to convey. Joiner and Josephs make clear and easy work of it. I believe this competency is one of the chief gifts of the book and one that will make the book particularly useful to its readers.

The manner in which they tease out how the different levels function has a simple clarity to it that comes only from long experience. This shows up in the seamless integration of a coherent organizational structure of the contents, in the presentations of the various aspects of leadership agility, in the selection and explication of core competencies, and in the way the stories bring the distinctions to life. I came away thinking that readers' chief benefit may be in not needing to sift through unnecessary verbiage, or possess prior subject knowledge to mine the gems in this book. All of these factors lead me to judge thehe book's approach to be integral in presentation, content and organization—all without reliance upon jargon or any particular model's terminology.

A minor point triggered my attention as I read through the book, and one deeper concern arose. The minor point arose in relation to their claim about Jim Collin's level five leadership. In their very first footnote, they make a distinction between Collins use of the term "level five leader" and their use of level five leadership, saying that their analysis shows it to be only at their achiever level. On page 77, they point to how a leader using achiever level agility was a level five leader in Collin's terms. I am going on second hand knowledge here, but it felt to me that Joiner and Joseph's analysis might have devalued Collin's work in this area (and I regret not having the time to check into this).

A larger issue for me was the third section of the book. After being very pleased with the way the first two sections did their jobs, I expected to find similar clarity and structure to facilitate my self-assessment and development of leadership agility in the third section. The further I read in its two chapters, the more I came away feeling that I was much more left on my own to sort things out. I began to wonder how other readers might sort out their self-assessment from the answers to frequently asked questions and the stories that comprised the bulk of that chapter. The next one on developing leadership agility left me feeling much the same.

Upon reflection, I wonder if here, at the stage where so much energy and effort had gone into creating a clearly communicated and well-structured set of distinctions in the previous sections, the authors could not find an equally elegant way to address the even more complex and thorny question of how to guide a reader through a self-assessment. While I could sort out things for myself, I recognized that previous familiarity with these models gave me an advantage that many readers might not have. From this third section, I came away with the critique that Joiner and Josephs had not mustered the same accessible clarity achieved in the first sections of the book. The work's only weakness seems to be in helping others apply it for themselves.

In the end, I did not feel that this gap in the last section detracted enough from the book to dampen my enthusiasm for what the authors have managed to accomplish. This book can provide leaders and those who wish to be leaders with tremendous tools to enhance and grow in their agility as leaders.

Humanity, Forest Ecology, and the Future in a British Columbia Valley: A Case Study

Stephan Martineau

Abstract: One of the most important and challenging issues facing humanity in the 21st century is the increasingly complex human-ecology interface. This article suggests the potential that integral mediation and integral ecology hold in addressing this interface. It distinguishes two categories of ecological challenges, *removed* and *local tangible* ones, and indicates that they require adapting methodologies to address them. Using a local tangible challenge—a 35-year old conflict over land use issues in the Slocan Valley, British Columbia, Canada—as an example, an integral mediation approach is outlined. First, context is given, both historically and geographically. Then the main capacities employed in the vision-building and mediation process are outlined. The article presents the case in such a way as to emphasize some generalizations, favoring these over a presentation of many case details. It concludes with a brief description of perspectives that are prerequisites in order to successfully apply integral solutions to the human-ecology interface.

Keywords: human-ecology interface, integral ecology, integral mediation

Introduction

A deep breath in, and out. I looked up at the forested mountainside that I could see so well from our front deck, and finally admitted it to myself: this was not going to work. I had spent the last eight years trying to protect this beautiful landscape—a watershed that provided us with the purest of waters—from road building and clearcut logging. From the steep and fragile slopes ran water that could be savored straight from the creeks. Kneeling down to drink its sweet freshness had sustained me many a time, renewing my commitment to do everything I could to help protect it and thereby also the Life in its myriad forms being nourished by it.

The last year had been spent organizing an international conference aimed at raising awareness for the essential importance and fragility of water. This effort had tried to bring all sides to understand that what we still had in terms of water resources was indeed very precious and that it was possible to protect it, while also acknowledging and meeting the varied needs of very diverse populations. The conference was called FLOW: an acronym for both "For Love Of Water" and "For Love of Our Work." A wide-ranging group of 45 speakers and over 350 delegates had come together for what turned out to be a great success from the conference-circuit perspective, leaving participants with a high level of inspiration, new knowledge, and maybe most importantly, connection and networking.

But there was hardly a show from the logging faction of the equation; their absence spoke of failure from my perspective. A true solution would be one that all sub-cultures of our society could embrace and support. In addition to the continued lack of presence from the logging community at this and other related events, I was also becoming increasingly aware of the self-

SOME RIGHTS RESERVED

centered relationship to life some key environmental organizations often held at their core. The altruism presented to the world was just part of the picture. Beneath the albeit sincere, outer façade hid an alarming competitive spirit of self-preservation that led to ongoing backbiting amongst the organizations themselves as well as between influential players within these groups. I was dismayed to witness a level of animosity between people who actually believed in the same cause that repeatedly resulted in sabotage of great efforts and ideas from within and amongst the environmental groups themselves.

Wow, the mountain was indeed literally steep, and although the integral vistas that could be seen from the top were so clear and majestic, the way there seemed very elusive. As the breath escaped my lungs, tears came to my eyes. I had a contract with this forest, a promise made that included health and wholeness. The year was 2000, the future uncertain.

The environmental challenges we face as a human family standing at the beginning of this new millennium are more complex than ever before. With the advent of the communication revolution over the last 100 years, and the increasing speed at which information now travels, the spectrum of consciousness we span has widened considerably, and this not just on a global scale, but also region by region. Our needs, values, and perspectives are now often hard to reconcile within our own blood families, let alone our bioregions, countries, or continents. Life conditions are changing at an exponential speed creating a climate in which stress and knee-jerk reactions are accepted as the norm. Our political environment is stuck in shortsightedness, averaging a four-year look ahead, when what we increasingly need are 100- and 200-year perspectives. We are indeed living in interesting times, and to navigate them requires a wider and more comprehensive map.

Over the last 40 years our ecological awareness has increased, but along with it so has everything else: our population numbers, consumption levels, deforestation, pollution, and resource depletion, to name just a few of the current environmental challenges. The environmental movement that seemed to be on the upsurge in the 1980s/90s has not succeeded in achieving the level of change it originally aspired to and was driven toward. Why? My sense is that the complexity of the terrain came as a surprise to most. Once we understood the dire present ecological situation, let alone the bleak predictions for our planetary future, we thought environmental sanity was just plain common sense. However, we soon realized that we human beings are an integral part of any ecological solution, and that we are complex beings, to say the least. It was difficult for those of us convinced of a need for greater ecological sensitivity and action stemming from this increased awareness to marry our ideals with our daily lives. In addition to our own challenges of “walking the talk,” we also tripped up over other limitations such as emotional issues, our often narrow perspectives, and our inability to truly come together and work with like-minded people, let alone other-minded individuals with very different perspectives and worldviews. With the immensity of the challenges staring us in the face, many tried to forget what they once so strongly believed in, adapting their worldviews and related life styles to the imperfection of the situation at hand. Others became radicals, boldly and at times loudly embodying their ideas to an extreme, with little regard for others. Yet others became professional activists, working on environmental issues as full-time jobs, applying steady and sustained effort to issues that were often determined by what their organization (employer) could get funding for.

The obstacles and bumps in the road toward a more just, sane and ecologically aware world were harder to overcome than anticipated, and they are still being felt. Human consciousness and our ability to understand it, both in ourselves and in others, lies at the root of our capacity to navigate the environmental issues of the 21st century. And, as mentioned above, these ecological challenges have not decreased over the last 40 years; indeed, they have grown in both scope and level of complexity.

In this article I attempt to demonstrate a way forward and also take a brief look back in order to highlight some of the mistakes that we have made in our efforts toward increasing our levels of responsibility and awareness in relation to the fragile earth that we inhabit. I will use as a case study my experience in environmental activism in the Slocan Valley of British Columbia, Canada.

Integral Ecology

When dealing with any ecological problem we are basically dealing with human beings and their relationship with the natural environment. We—the human species—are the main cause of most present-day environmental problems, and it is therefore essential that we consider ourselves as a central part of any proposed solution in order to encourage its successful implementation.

As we attempt first to understand a problem, and then to figure out possible solutions, we must navigate amongst and appreciate many differing value systems, worldviews, priorities, preferences, habits, needs, fears, reservations, even differing cultural norms, and exterior structural and societal limitations. Given the complexity of one human being, bringing together a group of individuals, possibly even a whole bioregion, province/state or country to agree on a course of action can indeed appear to be extraordinary, if not entirely impossible. And yet, unless we take into consideration *all* that a human being is as an individual and *all* human collectives, an environmental solution, however sound it may be on paper, will fall short of “sticking,” of getting implemented, and achieving any real change.

An integral approach to the human-ecology interface offers a way forward in the midst of all this complexity. This approach honors and integrates all the various values and perspectives. It understands that all of these have something important to say and to contribute. And of course, in order to do this, we need to acknowledge the complexity of individuals and communities, as well as of any given environmental situation. In addition, understanding that it takes more than one individual, worldview, or knowledge base to apprehend the full picture as we endeavor to find solutions, we come to realize that each perspective actually holds some aspect of what needs to be considered in a solution that can be embraced by all. In other words, each perspective holds a jewel. Often this jewel is limited in some way, but it still remains an important part of the way onward and forward. Thus, bringing multiple perspectives together is the challenge, but also the opportunity.

While I have been explicitly informed by an integral framework, my inclusion of this in the case study I describe below has been much more implicit in my work with the core group that has become the Slocan Integral Forestry Cooperative (SIFCo), not all of whom had heard of such an approach beforehand. Some of the core group have since become interested and have learned more about the integral approach. Others have simply been open to it as I have facilitated the group and have worked from a stance of attempting to take into consideration as many facets of the situation as possible: interior *and* exterior realities; individual *and* collective dimensions; how our consciousness and our understanding of the world and ourselves changes and evolves; the past, present and the future; and the many aspects of human nature: body, mind, soul and spirit.

It has been my experience that it is only by using an integral approach that a diverse and divergent collective can come to resolution, a vision, and an action plan forward. Anything less will fall short of solving our present prevailing ecological predicament: actions are becoming less and less optional, and vision alone will solve nothing.

Two Types of Environmental Challenges

We can classify the environmental challenges that we face today into two categories. Each one requires a slightly different approach.

The first category is *removed* challenges. These encompass ecological situations that we are facing indirectly due to their location and/or scale. Examples of this type of environmental challenge are global warming, the protection of ecological and wildlife values in non-human zones, international water exportation agreements, and CFC released into the atmosphere. Because of the magnitude or removed location of these challenges, they are more likely to be viewed impersonally: some individuals will be ambivalent in relation to the problem, others will have no clear opinion, and a very few will have a strong emotional and cognitive response associated with the issue at hand, as well as a sense that they can perhaps make a difference. These kinds of environmental challenges are generally dealt with at policy, political, and organizational levels.

The other category is *local tangible* challenges that affect everyday citizens directly; for example: expropriation of private land for road construction or high voltage electrical lines, displacement of villages in a proposed flood zone by hydroelectric dams, or a polluting industry that moves into a neighborhood. A distinguishing trait of this category is that pretty much every citizen within an affected area will have an opinion that is influenced by strong emotional and cognitive reactions to the issue at hand. An ecological problem within this category is experienced as a very personal issue by most, and dealt with at the communal, personal and local levels. With this type of ecological problem, people generally feel that they have at least a chance to affect change.

The remainder of this paper focuses on the application of an integral approach to a local tangible challenge[1] that affects everyday citizens: the long-standing controversy around forest management in the domestic use watersheds of the Slocan Valley in British Columbia, Canada.

Slocan Valley Forestry – A Case Study

Background

Over the last several decades, the Slocan Valley has become known in British Columbia as a place where the local communities take tremendous interest in the forests and watersheds that surround them. The vast majority of local residents' domestic water supplies come directly from small creeks that tumble down the forested mountain slopes and fragile springs arising from hidden aquifers. These are sensitive water sources on which the local population is dependent for both irrigation and domestic needs. For the last 35 years, competing demands have been placed on the landscape by divergent interests: domestic water licensees, forest workers, forestry companies, outdoor enthusiasts, farmers, First Nations, and the government. The result has been tense relationships, to say the least. After 15 years of dedicated grassroot effort to come up with an alternative to the proposed and planned areas for logging cuts, in 1991 the logging industry, backed by government, began to build roads and log clearcuts in people's watersheds. Protests and ensuing arrests in the valley due to conflicting interests sadly became commonplace. Over the last 15 years, and as recently as 2004, over 120 individuals have been arrested, standing for what they believed to be a just cause: water and ecosystem protection. While arrestees paid personally for taking a stand, the community has paid with social divisions and a sense that the economic future is tenuous. Many tax dollars have been spent for very little return, and the situation is yet to be resolved.

---

[1] While making a distinction between *removed* and *local tangible* ecological issues is very helpful, many of the findings discussed in the following on how to work with local challenges can be translated and adapted to working with the removed type of environmental problem.

The Geography – providing a sense of place

The Slocan Valley is a long (over 120 km) and narrow valley consisting of approximately 840,000 acres of land and water. It is situated in the West Kootenay region of Southeastern British Columbia. The rugged Selkirk and Purcell mountains provide a spectacular backdrop for the Slocan Lake at the north end of the valley and the Slocan River that meanders through the south. The high elevation terrain of the steep and broken valley walls is home to alpine meadows, glaciers, and rocky peaks. This combination of forested mountain slopes, high elevation peaks and meadows, all crowning the lake and river, provide stunning natural beauty.

Approximately 6,000 people inhabit the Slocan Valley. They share this land with a wide range of animal species, including grizzlies, black bears, deer, elk, wolverine, mountain caribou, coyotes, lynx, mountain goats, cougars, and bobcats. The Slocan Valley is part of what is known as the only Interior Temperate Rain Forest in the world. The "continental" climate is usually warm and sunny in the summer, and overcast and below freezing in the winter. Average annual precipitation ranges from 30 to 70 inches.

The Population: who came to be here, and when

Historically speaking, the Slocan Valley was first used by First Nations people of whom a small but very active band, the Sinixt, still calls the valley it home. The mining boom of 1890 marked the arrival of early settlers coming mainly from western USA, a hard-working group of people. Many of their descendents still reside in the valley and are associated with one form or another of resource extraction.

Economic activities associated with mining led to the development of roads, ferries, and railways, opening transportation routes for pioneer homesteaders in the early 1900s. These early pioneer homesteaders were mainly of Doukhobor descent. The Doukhobors (meaning Spirit Wrestlers) were a group of Russian peasants who escaped persecution in Russia in 1899. At that time, Leo Tolstoy and his colleagues, the Society of Friends (The Quakers), helped 8,000 of them immigrate to Canada. The persecution in Russia had begun four years before, when at Easter time Doukhobor conscripts, called to serve in the army, laid down their weapons and refused to continue military training, stating that they could not continue participating in the taking of human life. The Doukhobors are Christians; they base their philosophy on two commandments: "Recognize and love God—the spiritual force of Goodness and Creativity—with all thy heart, mind and soul" and "Love thy neighbor as thyself." For over 60 years the

Doukhobors maintained an established communal lifestyle in the Slocan Valley and surrounding areas. This led the Encyclopedia Britannica (1960 edition) to describe them as: "…when living up to the standard of their faith, they present one of the nearest approaches to the realization of the Christian ideal which has ever been attained." In the 1960s external pressures brought an end to their communal life style. Today only about 20% of the Slocan Valley population is of Doukhobor descent. Many of the descendants have joined the resource extraction faction of the valley. The elders are avid gardeners. They still administer their own playschools, youth groups, publications, Russian language classes, community and cultural centers, and heritage sites. They meet regularly for prayer services, spiritual meetings, and cultural festivals.

In the early 1940s, following the Japanese attack on Pearl Harbor, both the United States and Canada relocated people of Japanese descent to what became known as internment camps. Essentially, these people became civilian prisoners of war, even if most of them were already citizens of one of these two countries. Of the 23,000 interned in Canada, 7,500 were sent to the Slocan Valley and placed in six different internment camps. Today, a small number of these so-called "ex-prisoners" and their descendents still live in the Slocan Valley.

In the late 1960s the next major wave of immigration occurred when young migrants, this time from the United States, discovered the Slocan Valley. American men were being drafted as soldiers for the war in Vietnam, and Canada provided a safe haven to avoid the draft and to establish a peaceful existence working with the land. Hundreds upon hundreds traveled north and discovered the Slocan Valley. A colorful array of communes sprung up. Alternative schools were built, food coops and community halls established, most beaches became clothing-optional, and the green plant started growing everywhere. These newcomers talked gender equality, free love, racial equality, and consensus decision-making. Environmental organizations were born. The then-emerging green movement had moved in, and this was the beginning of a 35-year long period of unease and conflict between this new wave of people and the long-established resource extraction faction of the community. A significant percentage of the present population arrived during this time, and many of their children have chosen to stay upon reaching adulthood.

In 1978, another event was to shape the future of the community: a forest company, Slocan Forest Products (SFP), was started up in the Slocan Valley. Until that point, the resource extraction faction of the community had been fairly diversified, and many small saw mills were spread out along the valley. None of these would survive the advent of SFP. Later, this company became the biggest forest product corporation in British Columbia, and in 2004, SFP merged with Canadian Forest Product (CANFOR) to create a new international giant.

In the early 1990s, the last significant wave of migration started and has continued to this day. A new era of "counter culture" individuals arrived, a group deeply established in "green" ecological consciousness, many equipped with higher education and a determined enthusiasm and motivation to do things differently. Among their distinguishing characteristics is a strong interest in a more spiritual life with a committed emphasis on "walking the talk." Vegetarianism, meditation, yoga, raw food, cleansing, voluntary simplicity, organic gardening, artistic expression, creative livelihood, activism, and leisure would become their main activities. They were joined by a growing number of "urban refugees" and semi-retired professionals, many of whom are well educated and financially independent.

This diverse assembly of individuals makes up the Slocan Valley of today, a small group of people (about 6,000) spanning an extremely wide spectrum of perspectives and preferences. Add to this mix a multi-national corporation whose main mandate is the growth of its shares' value on the open market, and a government that in British Columbia is heavily financed by the forest industry, and an interesting situation is a sure result.

The Challenge

The Forest Crisis

In order to fully grasp the situation in the Slocan Valley, one needs to understand something about the land base in British Columbia. The following is a short synopsis.

In British Columbia (BC) 95% of the land base falls under what is called "Crown Land" or in common terminology "public land." The other 5% is private land. Of the 95% public land, 12% is provincial parks. Such parks are protected land. Beyond these, most of the remaining public land is available for timber extraction. How did this come about? In 1865 the government of the day passed a land ordinance making it possible for government to grant rights to timber on public land to private interests without the government losing title to the land. By 1907, government had already granted the rights to timber to private interests on over 20 million acres of land. By the 1940s, the harvest rate of trees in BC had tripled, and the private companies holding the rights to these millions of acres of land had reached the limit of available timber supplies. So the timber industry needed access to more Crown Land. The government of the time got a little nervous about the prospect of future timber shortage, yet did not want to lose the investments made by these big corporations. Thus, in 1947 it decided to amend the Forest Act and to introduce the concept of "Sustained Yield Forestry."

Two very important things came out of the new amendment to the Forest Act: (a) long-term exclusive forest management licenses (later to be named Tree Farm Licenses—TFLs), and (b) regulation of harvest rates. In other words, companies were given additional large parcels of land to manage with a harvest rate set by the government.

Today, two forms of tenure—*area-based Tree Farm* Licenses, and *volume-based forest* licenses—account for over 85% of the volume of timber cut on Crown lands in BC. Almost all area-based TFLs in existence today were granted before 1966, while the volume-based forest licenses were introduced in 1978, the year the Forest Act of 1947 was amended. The latter differ from the TFLs in that government gives these lands to companies, and companies have to cut a certain amount of wood from them every year. Government then gets a stumpage fee from each tree cut. By combining both the TFLs and the volume-based forest licenses, it is evident that fewer than 20 companies control 70% of the volume of timber cut in BC each year.

The Slocan Valley has a Tree Farm License that covers 24% of the land base; the volume-based forest licenses cover another 45% of the land; 24% is provincial parks (double the 12% provincial average for parks); and 5 % is in private lands. In other words, 98% of the land is spoken for; close to 70% is forested land and slated to be cut at some point in the future.

So What's the Problem?

Imagine moving north to Canada, escaping the draft for the Vietnam war, and finding a wild area, scarcely populated and with lots of cheap land available. You are hundreds of miles away from a big metropolitan center, surrounded by clean creeks, rivers and lakes, with four months of sunshine in the summers, and mild winters: a paradise where all your dreams can come true!? All those dreams born in the Berkeley cafes and on the LA beaches... Hundreds of you congregate there, with ideas, visions, and ideals aplenty. The first summer is the best; everyone swims in the river, talks late into the night, and dreams of a new world just about to be created.

Then the deciduous trees and larches begin to turn yellow, the evenings become chilly, and the reality starts to dawn on you that life and the dreams you hold have a few things in between: work being one, personal growth another, and creativity probably the most important. Many relationships go sour, the warmth of the city begins to beckon. Most will leave. But some stay, drawing upon a creativity and dedication they might not have known existed. They build their homes and learn a variety of new skills: growing their own food, building with logs, and slowly getting established. The water line gets hooked up, a one-inch pipeline is buried two feet under the ground so that it won't freeze in the winter; sometimes the lines run thousands of feet, all the way to the closest creek that runs down the forested mountain sides. There, right by the creek, a water box is built to receive the fresh running water; attached to it is the water line, and that's it! The elevation difference between the box and the house creates your water pressure. You turn the tap on in your newly constructed house, and pure creek water flows out. You fill a glass, taste the water, and your life changes… The creek now flows through your veins. The creek water will slowly become 70% of your physical makeup, the average water content of a human body. The effect of this is hard to measure, but it is indeed for many the beginning of a love story. A love story between a people and the water that runs down the mountainside.

Each spring and fall you go to your water box to clean it up, emptying it and removing the sediment that has accumulated at the bottom of the box during the last six months. Back home for a drink of fresh water, the floating sediment you had noticed for the last few weeks in your water is gone. Deep contentment.

And then, one day, it happens. George, your neighbor, calls. He sounds very concerned. He has just gone to check his water box, and half the box is full of sediment. When he turned the tap on at home the water was brown. What is going on? The only way to find out is to walk uphill, following the creek. About two kilometers later you find the cause: A new 160-acre clearcut, with a logging road that has just washed away into the creek. This is sacrilege, this is the end of the world, outrage fills you: "How dare anyone destroy this fragile and faithful creek? This will never happen again! This is my newly found passion: Water is life, I am alive, never again, OVER MY DEAD BODY!" The year is 1972.

And that's only one side of a multi-sided problem. Check out this reality: You grew up here, have spent every day of your childhood roaming the fields, forests and valleys. Your great grandparents first made this their home, immigrating from Sweden in 1894. The stories of their settling, clearing the land, the many mosquitoes, the hard work, discovering the bountiful riches of this land: wildlife for hunting, silver and ore for mining, huge cedar trees for building, salmon and a wide array of fish right there at the tip of their fingers for fishing… all these and many more anecdotes were woven into the stories told to your grandparents, your parents and yourself. You feel embedded in a continuous stream: your family and this land belong together. You love this place, and feel lucky to be here. It is home. You belong here. The few times you have ventured to the city only confirmed this. You are uncomfortable there, out of place, feel pity for those who live and work in stuffy closed-in spaces, who can't call their home their own. Here you step out of your house each morning, look over your pasture and garden, notice a few jobs that need taking care of around the yard and get ready for another day's work of logging. You love working outside, the fresh smell of a newly cut cedar tree filling the air, the noise of your chain saw doesn't bother you, it is familiar. Holding it firmly in your hands as you skillfully clear one tree after the other, you enjoy the sense of power and strength it gives you. You are a hard worker, and the guys at the mill respect you. However, it is not always an easy existence; in many ways it is a tough life. Money is often scarce; and although you yourself don't have a mortgage, you see many of your buddies struggling to make their monthly payments. And then there is increasing talk at the mill of possible closure due to lack of wood. You used to be able to go out and clearcut close to the home in the neighboring side valleys, now you often have a 20-30 km drive to just get to your work site. The valley has changed so much with all kinds of new people arriving. The stream of hippies who arrived in the 70s has been replaced with other waves of newcomers, many who seem to hold similar values as the former group, but are not as obviously "outlandish" – some even have short hair (!). They are fiercely protective of the water running down the mountain slopes and will do pretty much anything to stop you and your buddies from getting in there to do your job. Once in a while they pique your curiosity. Mostly they irritate you, sometimes downright enrage you… with their arrogance, with their very literal way of getting in your way by holding blockades. Who are these people? They pose a threat: to your kids, your job, and most of all YOUR WAY OF LIFE! They speak of logging practices that are "sustainable for future generations," of scientific evidence, and that you have no feelings for the trees. And your response? "What's the problem? I am 4th generation here and there is still plenty of wood! Besides, if I stopped logging, how would I survive? You guys just hang out and protest. Get a job and stop complaining." The year is 1994.

The above brief descriptions are only two snapshots in time representing the life conditions, worldviews and values active in this bioregion. Another one that must be noted, but that I will not attempt to describe myself, is that of the Sinixt, the Native people here in the Slocan Valley. They, like many other Natives, have been subject to enough misrepresentations and I do not wish to risk another non-indigenous portrayal of a nation that was decimated by smallpox in the early 1900s, a nation that have called this land home for thousands of years.

But in impassioned moments they will speak of the fact that they have not yet been recognized by government, a government that had the audacity to declare them extinct in the early 1950s.

In addition to the individual perspectives that are subjective, directed and influenced by a mix of personal, social, economic, cultural and other lenses, there are also some objective facts that contribute to the ongoing conflict in the Slocan Valley. In other words, it is not just human-related, but also a very real one in terms of ecology.[2]

---

[2] Worldwide

- With new technology, such as satellite systems, low altitude photography and side-looking radar, scientists have now figured out that the world is losing about 20.4 million hectares of tropical forest annually and that if these figures are not reduced, we will lose all of our tropical forests in about 50 years. http://www.lclark.edu/~jay/Species%20Extinctions.pdf
- More than 10,000 square kilometers of North American ancient forests are clearcut every year. (*Roadmap to Recovery: The world's last intact forest landscape*, Greenpeace, March 2006)
- There are approximately 3,800 million hectares of forest in the world, nearly one third of the planet's land area. http:// forest *ry* .oxfordjournals.org/cgi/reprint/49/1/29.pdf
- Deforestation is second only to the burning of fossil fuels as a human source of atmospheric carbon dioxide. Global estimates on the amount of carbon given off annually through deforestation amounts to 2.8 billion metric tons. Deforestation accounts for at least 25% of the annual emissions of carbon dioxide by humans. http://www.ecobridge.org/content/g_cse.htm

And in British Columbia, Canada

Failed Attempts at Solving the Conflict

The struggle in the Slocan Valley has held a prominent place both in the media and politics for over three decades. Since 1974 the provincial government, in its attempt to solve the issue, has intervened nine times by sponsoring a variety of roundtable initiatives. Some of these lasted for years, involving skilled facilitators from around the province. Each process tried to come up with land-use decisions that would be acceptable to the majority of residents, together costing hundreds of thousands of dollars. Each initiative failed, some to such a degree that the initial division amongst involved parties actually widened during and after the process.

Summarized, the challenge the Slocan Valley faces in regard to its people, water, and surrounding forests thus involves:

1. A 35-year history of controversy over forest management in domestic watersheds;
2. Extreme polarities in perspectives and a wide span of competing values;
3. An exceptionally high degree of awareness by the local population regarding the issues at hand, with very strong opinions on all sides;
4. Deeply entrenched mistrust between various factions of the residents;
5. The historical fact that the BC government has already attempted to solve this issue nine times over the last 35 years, by sponsoring nine different initiatives at a cost of hundreds of thousands of dollars to taxpayers without any success whatsoever; and
6. A global and bioregional context of increasing water scarcity, depleted forest ecology, and declining economy in the forestry sector.

The Initiative: The Slocan Integral Forestry Cooperative (SIFCo)

> *"No problem can be solved from the same level of consciousness that created it."*
> (attributed to Albert Einstein 1879-1955)

In the fall of 2003, the provincial government of British Columbia announced its intention to offer forest tenures to communities as part of a province-wide tenure reallocation process. After 30 years of failed processes, an opportunity arose to start over, to try a different approach, one that would make use of the many lessons learned and take all the players into consideration:

- In British Columbia more than 2 400 square kilometers are clearcut every year. http://www.livinglandscapes.bc.ca/thomp-ok/env-changes/land/ch2.html
- Canadian logging causes almost 2.1 hectares (5 acres) of forest to be lost every minute of every day, principally to feed U.S. demand. *(Bringing Down the Boreal*, Forest Ethics)
- In British Columbia 27,000 loggers were thrown out of work between 1981 and 1991, not by "tree huggers", but by an increasing use of labor-reducing technology in the industry. http://www.sierraclub.org/sierra/199905/media.asp
- While the cut has increased dramatically, almost doubling over the last 20 years from less than 40 to more than 70 million cubic meters per year (Ministry of Forests), forestry has decreased its contribution to the provincial economy by one half, from over 10% to around 5% in the same period (Heaps). http://archive.greenpeace.org/comms/97/forest/jobtree.html
- The logging industry currently employs about 6% of BC's workers, down from 9% at the beginning of the 1980s. http://workinfonet.bc.ca/lmisi/bc-econ/FORESTRY/forestry.html
- B.C. gets only 1/5 as many jobs per cubic meter of timber logged as California and has one of the worst records of job creation in the forestry sector in the world (Pulp, Paper and Woodworkers of Canada) http://archive.greenpeace.org/comms/97/forest/jobtree.html

people, nature, culture, organizations, and corporations. I recognized this announcement as an opportunity to implement an *integral approach to community mediation* in the Slocan Valley of BC. The intention and aim were that an integral approach to a collective conflict could lead to the formation of a Cooperative that would hold tenure over some of the most contested lands and be charged with managing these lands.

If the residents of the Slocan Valley were to be successful in a bid for a community forest tenure, all sides of the ongoing conflict would have to come together under one vision. They would, together, need to change the course of history by replacing mistrust with a new direction that would benefit all members of the community. The social landscape was diverse. It was made up of First Nations voices; a conservative faction made up of loggers, miners and farmers; a highly concentrated and vocal green community; a multi-faith landscape; two internationally recognized environmental organizations; a strong artist community; and a multinational corporation (the main employer) involved in corporate forestry. Would they be able to rise to the challenge?

This new integral initiative would walk already charted territory, territory that had seen all kinds of approaches and processes stumble and fall. Was there a chance of making any headway whatsoever? Could and would an integral approach make a difference in navigating this landscape? Together with a small group of residents, I decided to give it a try.

Guiding principles

First we needed to come up with guiding principles that would start the process of building a foundation of respect for divergent local perspectives. Our initiative is therefore based on the following points of understanding:

1. Residents hold diverse perspectives and value systems in relation to the forest that surrounds them,
2. These perspectives and value systems are guided and influenced by a mix of social, economic, scientific, spiritual, psychological, cultural, political, historical and institutional lenses.
3. Each of these perspectives is valuable and pertinent and must therefore be considered into solutions that will work for all.
4. By including and building upon these perspectives solutions found will be more complete and viable in considering how the community and the forest can interface.

Mediating between trees and all kinds of people!

The problem in the Slocan Valley is specifically related to the interface and interaction between people and the natural environment, and to the myriad value systems and perspectives at play in regards to the issue. Thus, very early in the effort it became clear that a central component of achieving a Community Forest and then managing it in an integral way would have everything to do with our ability to work with people. In other words, success in achieving a Community Forest depended to a large extent on our capacity to navigate amongst and appreciate many differing value systems, worldviews, priorities, preferences, habits, needs, fears, reservations, even differing cultural norms, as well as ecological limitations, corporate interest, and national and local laws.

One of the main criteria to succeed in securing a community forest in BC is to get broad-based community support. Would it be possible for the union, the logging company, the recreation enthusiasts, First Nations, environmental organizations, and the residents to come together under one vision? Given the valley's history, it seemed unlikely. I was excited to try, however: I perceived the situation as a perfect challenge to see if an integral approach could make headway where other less comprehensive attempts had failed. Of course, once a community agrees on a vision, many tasks remain: to identify and negotiate a land base, develop a business and management plan, incorporate as a legal entity, get the government to support the initiative. In all these further aspects, an integral framework has continued to play a major role (I will touch on this briefly further down). However, given the valley's history, it was this first step of getting a diverse and split community to gather behind a vision that seemed to really show how extraordinarily viable and practical the integral perspective actually is. To be sure, the project has been precariously poised between possible success and failure, with one curve ball after the other coming at it. But doors continue to open. People continue to surprise me and I am left with a deepened appreciation and hope for the potential of human beings rising to the challenge of coming up with solutions that require stretching to a different way of seeing a situation and working with it, together and alone.

In addition, because we succeeded in integrating the insights and needs coming from different value systems, the final resulting business and management plans are much more solid and realistic than if we had worked only with a more homogenous sector of the valley population. Bringing multiple perspectives together has, therefore, been one of the main challenges. It has also proven to be one of our greatest strengths, contributing to our Community Forest making ecological, financial, and social sense.

As mentioned earlier, I myself have been explicitly informed by the integral framework, but my inclusion of the framework has been much more implicit in my work with the core group that has become SIFCo, all of whom had not heard of this approach beforehand. Some of the core group have since become interested and have learned more about the integral approach.

In the following I relate the main ways in which I as facilitator, and in many instances also the core group, have utilized the integral framework in our attempt to secure a community forest in the Slocan Valley. Rather than step-by-step activity descriptions, the following are generalized descriptions of the main capacities employed.

Practicing the ability to simultaneously hold and inhabit multiple perspectives.

In order to find a solution to the environmental conflict in the valley, we needed to discover a mutual understanding between diverging viewpoints and interpretations. This was important both to honor and understand the different voices and concerns present, as well as to actually come up with pertinent and comprehensive responses to a very complex issue. By acknowledging and integrating the many differing perceptions of reality held within the community at large, each person could feel understood and respected and begin to contribute to a solution. This required that those of us who met with residents, various interest groups, and the government had to bring flexibility to our use of language, embody a willingness to see and appreciate the healthy aspects of each perspective or set of values, and have the cognitive capacity to actually inhabit a perspective different than our own. Inquiry and deep listening were a central part of the process.

Awareness of and ability to manage people's multi-faceted diversity (multiple "lines").

The awareness that what each person offered to the process and to the group was made up, motivated and defined by a multitude of emotions, beliefs, interpersonal habits, moral and ethical inclinations, physical circumstances, cognitive abilities etc., encouraged me to further develop a key skill: the ability to reframe positions held by others into issues and questions that required attention and that could lead to creative solutions. The awareness of multiple lines also greatly informed my group facilitation efforts. It helped me pay attention to the entirety of each person present, even whilst the focus has foremost been on the cognitive dialogue underway (for example, by creating a physically comfortable situation, a place where people could feel safe emotionally, offering and modeling constructive interpersonal skills, noticing where and when someone needed extra support or consideration etc.)

Commitment to personal growth.

In order to be as fully available as possible to what was unfolding amongst all the parties involved and not get tangled up in one's own shadow or agenda, it has been essential to work toward bringing awareness to our possible attachments and aversions. In addition, the ability to be attentive and present, centered, warm-hearted, empathetic, clear, patient, persistent, and to bring both depth and lightness (often with humor) to the process has proven invaluable. Who we *are* plays at least as great of a role as what we *do*. Of course, all these qualities require a certain level of maturity.

> In the heat of any conflict, one can work on developing the capacity to be present to every aspect of that conflict, while stepping aside from one's own point of view and learning to distinguish one's thoughts, from one's emotions, from one's perceptions, from our conflict partner's point of view, to embrace a broader, more integrated, view – in the words of Thich Nhat Hanh (1987: 1), to *be* peace. (Bowling and Hoffman, 2000. p.23)

Facilitating experiencing the bonds of shared motivations.

While each participant in the process generally sees the world through the lens of their particular perspective on the situation, a collective glimpse into a possible future was made possible by skillfully touching on and addressing what I call the "spine" of the group. In other words, addressing and calling forth that which simultaneously touches a resonant cord in everyone. In our case, this was achieved by addressing the overarching care that each individual held for the well-being of the community and the fact that everyone wants a healthy economy, a healthy ecosystem, and clean water. How each person interprets, expresses, and translates their feeling of care and concern, and the span that this care and concern has, can differ greatly, of course. But these were the threads that ran through each person and that formed the spine of the group. I was thus able to utilize these common, healthy, authentic threads as "elevators," as something to draw upon in order to bring people to an inspired and motivated place that made possible a certain amount of stretching in each participant. It was the articulated vision of a thriving community (both economically and socially) in a healthy ecosystem that brought everyone to see themselves in this vision and thus to support it. In such moments, people did not feel threatened by the vision; rather they could see themselves thriving while being part of something greater than themselves. Of course these experiences were translated differently by different people. For some, the translation ended up in an heroic effort to "save the day;" for another it was translated into "doing the right thing;" for yet another, the motivation laid in saving the water and forests, and gaining a sense of belonging. Each in their own way translated the common human yearning of being part of something meaningful and making a difference.

To enable such a collective bonding experience required using language that communicated directly with each person at close enough intervals so that no one ever felt lost, left out, or disconnected from the emerging mosaic that was being created. As Sean Hargens (2005) points out, it does not work "to take the value set of one worldview and try to force it upon another worldview . . ." (p. 22). This will only lead to unnecessary clashes. Thus, finding the highest common denominator, if only as a collective glimpse here and there, has proven invaluable in reaching agreements.

Balance of empathy/engagement and impartiality.

I have lived in the Slocan Valley for the past 15 years. I love it – the mountains, the creeks, the wildlife. I have knelt down to drink the pure water flowing down the valley sides regularly. This valley inspires and sustains me in many ways; its beauty and ecological health renews my commitment to do everything I can to help protect it and thereby also the Life in its myriad forms being nourished by it. I have attended more meetings than I care to think about, organized protests and conferences. However, I found that a key component to being effective in securing a community forest was that I cared, gave myself fully to the work at hand, and at the same time did not get drawn to the point of identification with and attachment to the process and its outcome. Both empathy and impartiality were essential. The former allowed for the interest, concern and motivation necessary to sink deeply into the process, the latter allowed me to embrace and hold additional perspectives. Without impartiality, I could easily have become useless, losing the larger context and perspective, getting pulled in specific directions, and becoming personally attached and driven. It helped me to approach this project as a case study, as an opportunity to learn how and why it might or might not succeed. This gave me the necessary distance to be effective.

Importance of discernment.

In order to cultivate mutual understanding and a way forward to constructive and comprehensive action, it was necessary that everyone participating in the core group held certain qualities of being. These qualities, attitudes, and capacities proved to be essential in order for us to be able to implement an integral approach in such a divided community. I believe that discerning who has the following qualities and, if possible, recruiting and engaging those particular individuals can be one of the most crucial steps in attempting to implement an integral ecology project on the ground. These qualities, attitudes and capacities are as follows.

- Natural inquisitiveness, an ability and willingness to listen to others.
- Integrity and reliability, where actions are aligned with words.
- A voice of reason to offer to their respective constituency, being respected and carrying a certain influence.

- Flexibility: not too entrenched in a particular value system, not too vested in one's own perspective—personally, socially or professionally.
- An inherent quality of being that includes personal growth as part of the life process, even if only unconsciously.
- Motivation of care and concern for the greater community and ready to seek its betterment.

Notice here that these qualities are found in certain individuals across *all* sub-sections of a community. In other words, they are not value-system dependent. This was invaluable to recognize because it was by engaging individuals with these qualities that we laid the foundation for our future success.

How the core team came to be

Lisa Farr from the EACT Watershed Association and I began by surveying the social landscape and acknowledging the historical conflicts among the priorities people valued most. We then approached two or three individuals at a time, people we identified that held, from our perspective, some of the key qualities mentioned above. We approached them in an inquisitive manner. We were genuinely interested in understanding the insights, information, values, worldviews and knowledge base they each had to offer. In this way we discovered what elements from each sub-culture needed to be included in the overarching direction of our process. We also presented our general vision for a potential community forest tenure in the Slocan Valley, but we didn't present a detailed vision of what the outcome of such a co-creative endeavor could look like. Rather, we briefly outlined the historical conflicts that were present in this bioregion (a topic all could agree on), and then presented the idea of transcending the past, while including the insights gained from what had not worked. We shared our intention of seeking *together* to come up with a vision for the valley within which all the needs (both from the natural and the human worlds) could be met, and the gems held by each sub-group's values would be included. We also communicated very clearly our conviction that by including all of the valuable insights available in the population we would end up with a much more viable way of interfacing with the forest that surrounds us.

These smaller meetings quickly clarified who was a good candidate for the core team, and who wasn't. We made it clear at the onset of these meetings that we were approaching our discussions as a way to learn more about each of the value systems and worldviews held in the variety of sub-cultures in the Slocan Valley. Our intention was that by the end of each meeting, everyone would see value in the project, would not feel threatened by it, and would feel appreciated for what they had contributed and could contribute in the future.

As this process continued we gradually formed a core group, a diverse collective from the very beginning.

What about the forest?

Once we had taken the first step—getting this diverse community to agree on and support a community forest—we developed our business plans and management and governance structures over the next few years. SIFCo's mission statement is "to create and operate a financially sound community forest business that fosters community and ecological health." This is reflected in our methodology and operational plans, which we have articulated for the short, medium, and long term.

On the ecological front we consider and plan for: the overall health of the ecosystem (including soil protection, biological diversity and wildlife, awareness of root and bark diseases); ecosystem restoration; wildlife enhancement projects; management and minimization of wildfire hazard; maintaining wildlife movement corridors; protecting water quantity, quality and timing of flow; protection of riparian ecosystems; and ensuring a successional pattern of multi-layered canopy.

On the economic front we consider and plan for: a diverse range of products, including specialty wood for value-added products; a long-term sustainable yield of harvest; enhancing economic diversity and sustainability of the community; local employment; retraining programs; non-timber forest products; developing partnerships and collaboration with local organizations and businesses; and retaining profits within the community for ecological restoration, community infrastructure and social programs.

On the social front we consider and plan for: inclusive and transparent public involvement; a monitoring and evaluation system, both internally and also involving the broader local public, to continuously improve SIFCo’s performance and maintain public approval; training programs for youth and under-employed; minimizing the visual impacts of harvesting and road building in order to maintain the growing tourism industry and satisfy local residents’ preference to maintain viewscapes; and protection of all identified First Nations cultural heritage features and, if requested by First Nations, an archeological impact assessment for specific areas.

Where we stand now

To date, and needless to say much to our delight, we have experienced that the integral approach we are taking does indeed work! We initiated this process in January 2004 with a small group of volunteers. This group has grown. Loggers, city council, environmental activists, the Ministry of Forest and Range, a variety of local residents and three resident associations have come to agreement on guiding principles, management guidelines, organizational structure, and a plan for future profit distribution of the Community Forest. We have received over 140 letters of support from a variety of non-profit organizations, as well as from government, businesses and individuals that span the full spectrum of values and perspectives. On March 2, 2005 we submitted a preliminary application for a Community Forest Agreement that would cover some of the most contested areas of the Slocan Valley. Our preliminary proposal was accepted December 2005: government offered us a certain amount of land. On September 25, 2006, government surprised everyone by offering us a new invitation, one that gave us the right to double the landbase that we were originally offered. On December 4, 2006, our three-year negotiation came to a conclusion: we agreed to an area of 35,000 acres. On December 7, 2006, we were officially incorporated as a Cooperative under the Cooperative Act of British Columbia. In January 2007, our final application was sent to the government, and in April we heard that our application was in the final phase of being accepted: SIFCo should be tenure holder at the latest in July of this year (2007).

When our application for a community forest is finalized, we will have before us a unique opportunity to further put the integral framework into practice in how the forest and watersheds are managed in an entire ecosystem. Three years ago, a community was extremely divided; very soon, together, a community will be managing the lands that surround them.

Concluding Reflections

Evolution happens a step at a time! This is a crucial reminder when attempting to practice integral ecology. In today's society, an applied integral solution may appear to be less than the most ideal solution imaginable. Why so? Because our minds and imaginations can come up with and envision solutions that are way ahead of where we actually are as a society and human family. A solution must be liveable – it must be "implementable" by those concerned. Otherwise it will remain just a good idea. Thus the achievable common ground of the general population that will live with the solution and actually bring it to life must be taken into consideration; this will determine how far and how fast a solution can actually go. In other words, an applied integral solution essentially takes the concerned population "where it is" and then propels it one step forward. This movement onward and forward may not be as far as some might wish, but it is a step forward nonetheless. Stagnation is replaced with movement that allows us to evolve toward a brighter future.

Understanding evolution from an integral perspective is important for two very practical reasons: first, because some people will tend to react negatively and indignantly to a solution that does not match their conception of the ideal. From a certain perspective, one could say rightly so, as there may be cases where an applied integral solution will seem to fall short of someone's ideal of what can be envisioned; taking into consideration the information at hand on the state of the environment and what is necessary to make a real difference, anything short of drastic and radical measures may seem futile. If we realize this at the onset, we can harness people's very important energy by acknowledging the fact that whatever integral solutions we may come up with to current problems, such solutions are but stepping stones toward yet-to-be more evolved solutions. This can be explained to people who are concerned or reactive. And we can be compassionate with what is agonizing for people who find it hard to settle for anything less than what they deeply believe is necessary. In over a decade of grassroot activism I repeatedly came across the sabotaging effect of immovable perspectives. Such individuals are often highly-motivated by ideals and principles that merit respect. But, by shooting for the moon, they can end up disheartened and, tragically, also with a trashed environment, because the "this or nothing" stance trips up their efforts. The environmentally-engaged activist often sees where we need to go, feels the urgency, but just as often presents solutions that disregard where many other people actually "are." An unwillingness to compromise, and a lack of consideration for how evolution in human consciousness generally takes place (i.e., "a step at a time"), has all too often backfired, with stagnation, alienation and disenchanted burnout being the result. This really is a pity; brilliant plans, models and solutions of what could and should be fall short of ever getting implemented. People are emotionally hurt and discouraged. Integral mediation will attempt to include the invaluable input and driving force of such values in relation to ecological conflict, and simultaneously pay attention to potential obstacles they might pose to an integral solution.

This brings me to my second point: integral solutions need to be constructed at the onset with *ever-evolving mechanisms in place at the core of their systems*. Our world is geared toward stagnation. Change is one of the hardest things to accomplish in society. Every time a change is implemented, there is a whole mechanism that breathes out with it, settling comfortably into a new structure of stagnation. For example, it takes an extreme amount of time and effort to change the building codes of a county so that they start embracing green building technologies. By applying an integral approach one may be able to get a county (or state) to implement a reduction in wood consumption during the construction phase by say 20%. According to leading edge environmental science, the real target to aim for is, say, 70%. However, 20% is better than nothing, and nothing it will be if the demand is for a 70% reduction. An integral thinker/facilitator will know that 20% is not enough. S/he will make sure that there are mechanisms in place for the 20% to become 30% and then 40%, as opposed to putting all the effort toward having the 20% set in stone and sealed by law. That would create yet another benchmark for societal stagnation, one that would require the same or maybe even more energy to move onward when the time comes for the 30% to be brought to the table. And at the speed that things are changing these days, such a time will come sooner rather than later.

In the next few decades, we will be facing some of the most interesting times in recorded history. Times that will challenge us to embrace an ever-complexifying landscape, which will require of us an exponential growth in our ability to navigate the interface between human societies and ecology. Integral mediation and integral ecology offer key perspectives to bring to the table as we begin to implement solutions in response to the planetary crisis we have placed ourselves in, both at the local and at the global level.

Exploratory Perspectives for an AQAL Model of Generative Dialogue

Olen Gunnlaugson

Abstract: Otto Scharmer's generative dialogue model of the four fields of conversation has been largely applied in organizational settings with the intent of fostering conditions for groups to learn to think together, generate new knowledge and solve the deeper problems that pervade organizational culture. This article introduces elements of Wilber's Integral or AQAL paradigm as an interpretive framework for advancing key distinctions within Scharmer's account of generative dialogue.

Keywords: consciousness, generative dialogue, integral, presencing, reflective dialogue

> *The ultimate source of the Susqehanna River was a kind of meadow in which nothing happened: no cattle, no mysteriously gushing water, merely the slow accumulation of moisture from many unseen sources, the gathering of dew, so to speak, the beginning, the unspectacular congregation of nothingness, the origin of purpose. And where the moisture stood, sharp rays of bright sunlight were reflected back until the whole area seemed golden, and hallowed, as if here Life itself were beginning* (Michener, 1995, para. 65).

Introduction

Like the proverbial Zen finger, Michener's quote directs our awareness to the hidden, yet always present source of life that plays a formative role in shaping us and our manifest world. Whether this underlying source is viewed from the form of a river, an artist's creation or a generative conversation, we are reminded of the significance of the subtle originating processes that are taking place *upstream* from our accustomed horizons of attention. Viewing this analogy within the context of group learning, a pervasive tendency of many groups is to unmindfully invest their attention in the currents of thought, past associations and conditioned habits that invariably surface *downstream* in our spoken discourse. Debate and discussion, though well suited to serving the interests of previous cultural-historical periods, focus primarily on the specific downstream thought *content.* Often this takes place to the exclusion of individuals and the group being aware of the subtle process of thought itself (Bohm, 1996) and the hidden source or blindspot out of which our thoughts and experience originate (Scharmer, 2000). These exclusions may involve process as much or more than they involve content. For example, in traditional debate, well-ingrained strategies to defend or advocate our views arise in part from a focal identification with our beliefs, positions and judgments. As Scharmer has argued, in practice such modes of communication prevent us from noticing what is taking place upstream. According to Scharmer's research on presencing (Scharmer, 2000; Senge, Scharmer, Jaworski, & Flowers, 2004), further upstream lies both tacit embodied knowledge and not yet embodied tacit knowledge (Scharmer, 2001) that emerges through contact with the unmanifest source of our experience.

SOME RIGHTS RESERVED

Following from Bohmian dialogue[1] (1987, 1996) and the MIT dialogue project (Isaacs, 1993, 1994), Scharmer's framework of generative dialogue (GD) (Scharmer 2000, 2003; Isaacs, 1999) addresses the above modes of attention and knowing within four fields of conversation. Building upon Scharmer's contribution, this article explores a set of distinctions advanced by Wilber's AQAL[2] lens in order to establish new distinctions and orientating generalizations to better serve practitioners and facilitators working with the GD framework. On the whole, this article ventures a series of exploratory perspectives concerning how Wilber's AQAL model can help augment the transformative potential of generative dialogue practice in various contexts of social, cultural, educational and business innovation.

A Brief Overview of Generative Dialogue

Scharmer's account of generative dialogue[3] offers at least two important contributions to the field of dialogue studies[4]. First, as a map of four archetypal fields of conversation that groups can develop mastery of, Scharmer's model (i.e., Figure 1) depicts how individuals and collectives move counter-clockwise from polite discussion (i.e., talking nice) through the field of debate (i.e. talking tough) towards more open, reflective dialogue and finally forms of collective intelligence[5] (i.e., generative dialogue). Scharmer (2001) describes each successive field as representing an increasingly complex pattern of conversation that reveals new forms of explicit (i.e., talking nice; talking tough), tacit embodied (i.e., reflective dialogue) and not-yet embodied tacit knowledge (i.e., generative dialogue). Secondly, GD offers a preliminary framework to honor more traditional forms of organizational and academic discourse alongside the relational and creative dimensions of dialogue, resulting in a more comprehensive map of conversation.

---

[1] As a practice, Bohmian dialogue is a way of inquiring into the individual and collective presuppositions, ideas, beliefs, and feelings that ordinarily inhibit communication. Bohm's conception addresses both our underlying assumptions as well as the psychological pressures behind these assumptions. In this sense, Bohm is proposing a basis for creating a new kind of culture where opinions and assumptions are not defended incoherently and people think together (Bohm, 1996).

[2] Wilber's AQAL model has become the shorthand version of his integral approach. AQAL is short for all quadrants, all levels, all lines, all states, and all types (Wilber, 2003a). For the purposes of this article, I have focused on the first four lenses, as I have not found the distinction of types to be that useful in the context of Scharmer's model.

[3] Though Scharmer's framework is by no means exhaustive of the possibilities of conceptualizing communication within groups, it offers an important contribution in accounting for the basic horizontal stages of conversation, group formation processes and rudimentary conversational practices that support personal and collective development.

[4] The proliferation of dialogue across a number of disciplines has arguably given rise to an important field of study in recent years. See Alexander's (2004) dissertation, *Coalescing the Field of Dialogue* for a sound overview of this emerging academic discipline.

[5] Experiences within the fourth field of generative dialogue are reflected in O'Hara's (2003) description of Integral Groups, in addition to other intersubjective methodologies within the emerging field of collective intelligence (Hamilton, 2004).

Within each field of conversation, Scharmer charts a cluster of characteristic ways of listening, orientation to learning in relation to time, habits of attention and speech acts (Scharmer, 2000; Isaacs, 1999) as outlined in Figure 1.[6]

Figure 1. Four Fields of Conversation

Note. From "Four fields of generative dialogue," by C. O. Scharmer, 2003, Generative Dialogue Course Pack. Copyright 2003 by C. O. Scharmer. Reproduced with permission of the author.

Initially there is often well-intentioned politeness and conformity to past forms of knowing and knowledge building (Scharmer, 2000), which leads to undiscussables (Argyris, 1990) or threads of conversation that participants avoid. This dynamic can arise when participants hold back what they are thinking or feeling and infer meanings upon the contributions of others based on previous interactions or projection. In order to move beyond this initial group pattern, Scharmer points out that individuals need to bring what they are *thinking* into alignment with what they are *saying*. If this initial transition is delayed, it tends to manifest later on with individuals needing to voice their "truth." The challenge in moving from *talking nice* to *talking*

---

[6] Scharmer's model is presented in Figure 1 even though all of its dimensions are not explored within this article. For further reference on generative dialogue terminology not discussed here, see Scharmer, 2000, 2003. For expanded accounts of Scharmer's initial model, see Isaacs, 1999; Gunnlaugson, 2006.

tough involves finding skillful ways to share the perspectives one is withholding or naming the dynamic within the conversation that is preventing authentic expression, as the container of the group dialogue tends to be unstable in this field (Isaacs, 1993).

Scharmer locates the conversational norms of argument and debate culture within the second field. Here participants can easily get locked into polarized and expressive views, followed by reactivity and combative listening (Scharmer, 2000). This culture of conversation risks various forms of breakdown (Isaacs, 1999) as individuals become overly identified with their perspectives and felt needs to impart or express their views. In my experience, moving from *talking tough* to *reflective dialogue* depends in part upon being more attentive to one's judgments, thoughts and psychological processes through the practice of "suspension" (Bohm, 1996). Suspension of one's judgments or reactions requires learning to bracket one's views and embrace competing perspectives as important partial illuminations of the larger gestalt of the group subject or issue. Shifts within the second field of conversation take place when participants who are otherwise locked into advocacy begin to collectively practice suspension as Bohm elaborates:

> Suspension is not easily grasped because the activity is both unfamiliar and subtle. Suspension involves exposing your reactions, impulses, feelings and opinions in such a way that they can be seen and felt and also be reflected back by others in the group. It does not mean repressing or suppressing or, even, postponing them. It means, simply, giving them your serious attention so that their structures can be noticed, while they are actually taking place. Suspension may permit you to begin to see the deeper meanings underlying your thought process and to sense the often incoherent structure of any action that you might otherwise carry out automatically (Bohm, Factor, & Garrett, 1991).

Suspension helps groups become more aware of the pervasive tendency to reenact past patterns based on unexamined assumptions, perspectives or beliefs. Similar to meditation, suspension facilitates in-the-moment awareness of our thinking and emotional processes, in turn helping us temporarily shift from a first to third person perspective of the contents of our consciousness. This opens nested creative spaces within ourselves (UL) and the group (LL) to witness these contents as the dialogue process builds. With sufficient practice and duration in the third field of conversation, participants learn about the "structuring, layering or genesis of their experience" (Varela, 2000), which slows down the conversation and in turn helps develop skills of empathic listening and thinking together as a collective.

Following Bohm's *suspension of thought*, Varela's phenomenological gesture of "redirection" (Varela, 2000) helps make the transition from field three to field four. Redirection involves learning to subtly move our attention to sensing the source of the stream of shared meaning of what is trying to emerge through the greater dialogue group as people share their contributions. Put in another way, redirection involves literally redirecting one's attention to the newly emerging content and "to the source of the mental process rather than the objects within it" (Varela, 2000). According to Varela and Scharmer, the gesture of "letting come" is a recursive move of attention that involves being receptive to new meaning, knowledge and insights. As such, when conversations move from the field of reflective to generative dialogue, there is a shift from reflective inquiry into our tacit assumptions to learning to engage with future not-yet-embodied possibilities arising through the practice of *presencing*. Scharmer's analysis of presencing suggests that this threshold between *reflective* and *generative* dialogue is traversed when participants within the group begin to “see from within the source of what is emerging, letting it come into being through us” (Senge et al., 2004, p. 45). Though different catalysts can bring a group across the creative threshold of field three and field four, it often involves a discontinuous shift from suspending one’s thoughts to *presencing* or redirecting one’s attention towards the emerging source of self-transcending knowledge. With practice, generative dialogue helps foster new capacities for collective intelligence as groups learn to cycle through the four social fields.

Generative Dialogue Through the AQAL Lens: Exploring Wilber’s Quadrants Within Scharmer’s Fields of Conversation

Wilber’s AQAL approach rests in his quadrant model[7], which acknowledges four basic co-arising perspective-dimensions of reality: subjective (i.e., the interior of an individual), intersubjective (i.e., the interior of a collective), objective (i.e., the exterior of an individual) and inter-objective (i.e., the exterior of a collective): Summarized as the interior and exterior perspectives of individuals and collectives, each quadrant refers to one of these four perspectives, each of which we can take on any life situation, and so upon any instance within the context of generative dialogue. Unpacking the quadrants within the generative dialogue model as a whole, any *moment* within one of the four fields of conversation is informed by a range of *experiences* (e.g., suspension, presencing, bearing witness), *behaviors* (e.g., advocating, inquiring, making decisions), *cultures* (e.g., the worldviews and values of the participants and group) and *systems* (e.g., guidelines and rules within organizations, classrooms, or learning communities where GD is taking place) that are particular to each of Scharmer’s four fields.

Figure 3. Wilber's Four Quadrants Within Each of Scharmer's Four Fields

Note. From "Four fields of generative dialogue," by C. O. Scharmer, 2003, Generative Dialogue Course Pack, Copyright 2003 by C. O. Scharmer, Adapted with permission of author.

Given that each quadrant exerts a relative influence within each social field of conversation, practitioners can call upon these four basic dimensions of their experience in any field of generative dialogue for a *broader* communion with different perspectives of their reality as its arising[8.]

In addition to generating the above distinctions among *Experiences, Behaviors, Cultures and Systems* within Scharmer's four fields, Wilber's quadrant model expands upon Scharmer's

---

[8] The quadrant model also offers a practical template to track the blindspots of the GD process more skillfully. When participants know the GD model, they can bring awareness to these four basic dimensions and perspectives in-the-moment to see if there is a territory within the field of conversation that is being ignored or neglected. Perhaps there is a breakdown within the group where the behaviors (UR) of the conversation are keeping the group stuck in *Talking Nice.* What shift in behaviors might serve as leverage points to help the group move to *Talking Tough* or *Reflective Dialogue*? Maybe there is something about the organizational culture (LL) that is constraining the conversation in terms of the tacit rules or guidelines that individuals adhere to. Recognizing this, a skillful group can bring in interventions into the LL to help move the field of conversation towards *Generative Dialogue.*

explanation of how rules evolve through the four fields (i.e., Figure 1). Instead of talking nice being merely about rule-reenacting, we can see via Wilber's four quadrants that rules are being collectively re-enacted within the Lower Right Quadrant, as are the UL experiences, UR behaviors, and LL cultures associated with those rules. If we move to the field of talking tough, it is not just that rules are being *revealed*, but the experiences, behaviors, cultures and systems surrounding those rules are being revealed as well. For reflective dialogue, experiences, behaviors, cultures and systems are being *reflected upon*. And for generative dialogue, experiences, behaviors, cultures and systems are *generated*. Framed in this way, we can honor the evolution of rules or guidelines within groups as well as these broader fundamental dimensions of reality (experiences, behaviors, cultures and systems) where evolution is tetra-unfolding within the generative dialogue process. This distinction becomes particularly significant in ensuring these four vital horizons of emergence within a given conversation are taken into account by the generative dialogue group. Additionally, Wilber's quadrants become particularly significant in the fourth generative field as groups evolve new experiences, behaviors, cultures and systems, ensuring that the full generative potential of the model is exercised.

Another practical example of the quadrants' usefulness is in its comprehensive honoring of diverse and competing epistemologies. An intrinsic bias of constructivist forms of dialogue practice is that they tend to privilege subjective (UL) or intersubjective (LL) ways of knowing as more important than objective (UR & LR) ways of knowing, if objective ways of knowing are believed to even exist[9]. Versions of dialogue informed by constructivist thought tend to rank interpersonal harmony and equality as the highest form of truth making within group life. With the epistemological map offered by the quadrants, it is apparent that this approach to dialogue need not exclude or marginalize other forms of knowing (i.e. particularly objective ways of knowing). In this way, the quadrants prevent generative dialogue from being used as a forum for the exclusive hearing of the values of the sensitive self[10], helping groups move beyond civically egoic forms of "conversational narcissism" (Arnett, 1992) by giving voice to a broader range of first-, second-, and third-person perspectives *within* each of Scharmer's four fields of conversation. Again, the quadrants facilitate the transition to a more integral practice of generative dialogue by honoring the four co-arising dimensions of reality within *all* the four fields of conversation.

"Levels" and "Lines" Informing Generative Dialogue Practice

No problem can be solved at the same level of consciousness that created it – Albert Einstein

In this section I evaluate Wilber's developmental *levels* within the context of various developmental *lines* (Wilber, 2003a), which represent distinct capacities of consciousness. Although there are lines of development running through all of the quadrants, for the purposes of this article, I will focus primarily on those developmental lines within the interiors of individuals and collectives (UL and LL quadrants) that inform GD practice. Given the absence of an empirically supported developmental model that measures the overall level of individual consciousness, it is important to note that *levels* refer to the orders of complexity within a given developmental line (Wilber, 2003a). In other words, as Wilber (2003b) explains, the particular context of development determines what one is measuring as Wilber elaborates:

---

[9] With the advent of deconstructive postmodern thought, objectivity or an objective perspective has been radically questioned, and in certain extreme constructivist circles, outright disregarded.

[10] Values of the sensitive self include consensus process, human bonding, ecological sensitivity, egalitarian thinking. As Beck and Cowan (1996) and Wilber (2002) note, the sensitive self places an emphasis on feelings, prohibition of hierarchy, relational, strives for authenticity, sharing, caring community.

> There is no such thing as a level of consciousness: a 'level of consciousness' does not exist by itself, because it is always a level *of some line* that is being measured: there is a level of moral development, a level of self development, and so on, but not a separate thing called a level of consciousness that you can see and measure. Consciousness always has some sort of content, and that content–moral, cognitive, spiritual, psychosexual, linguistic, artistic, etc.–is what you see and measure (p. 2).

Wilber draws on a broad assortment of developmental theorists and expands upon Gardner's notion of "multiple intelligences"[11] with his distinction of *lines* or *streams.*[12]

While not all the higher developmental *levels* of certain key developmental *lines* are capacities that are available to every participant, the later conversation fields of generative dialogue (i.e., reflective and generative dialogue) call upon more complex *intrapersonal* and *interpersonal* capacities of consciousness than the fields of polite discussion or debate.

Given the wide range of critiques against hierarchical models of stage development as privileging some combination of elitist, gender or ethnocentric biases by the researcher (Reeves, 1999), it is perhaps no surprise that dialogue theorists have been reluctant to draw correlations between one's level of consciousness (along specific lines) and one's capacity within different fields of conversation. Nevertheless, not all of the higher developmental *levels* of every developmental line are available to everyone, nor are all developmental lines significant to generative dialogue practice. As the next section outlines, in my experience as a facilitator of generative dialogue, I have found that certain capacities of consciousness offer important contributions to the process and practice of generative dialogue.[13]

---

[11] Gardner's seven types of intelligences include: kinesthetic intelligence, musical intelligence, mathematical intelligence, linguistic intelligence, spatial intelligence, intrapersonal intelligence and interpersonal intelligence.

[12] Reflecting on these developmental lines as a whole, it is important to note that the sequential (i.e., horizontal) movement through the fields of Scharmer's model is not to be confused with the movement up through the developmental (i.e., vertical) stages along different developmental lines of Wilber's AQAL model.

[13] Given how little Scharmer's model has been researched, determining what levels of what lines are more pertinent to serving generative dialogue than others remains an open question. In light of the absence of such research, this article attempts to offer a conceptual outline of an assortment of candidates. In my experience, these lines greatly assist and catalyze the emergence of the generative field of conversation. By sketching out a more integrally informed map of the interpersonal and intrapersonal capacities that support the emergence of generative dialogue, my intention is to help point the way to greater mastery of the practice. That said, it is important to note that experiencing the four fields of generative dialogue is not contingent upon individuals being at a high level in a few or all these lines. Each field of conversation emerges out of the larger gestalt of the group interaction, which is greater or is constituted with more complexity than the sum of its parts (individuals). The distinction of lines is

Cognitive Line

Beginning with the cognitive line, we cannot ignore Wilber's notion that the formal stage of cognition (i.e., discursive rationality) does not yet have the capacity to integrate the multiple perspectives with which we are presented by our increasingly interconnected world. That capacity, which Wilber terms "vision logic," becomes available with the emergence of the *postformal* level of cognition. According to Wilber (1995), vision logic is the capacity to allow differences and contradictions to coexist, and in doing this, to see how otherwise incompatible notions can fit together through forms of multiple perspective taking. Indispensable to the fourth field of generative dialogue, the nature of vision logic glimpses how things might "fit" together by weaving perspectives from the multiple currents and systems of meaning and ways of knowing that arise within the generative dialogue process.

Vision-logic is supported by "meta-awareness"[14] (Jordan, 2000), which develops from the practice of suspension. Becoming meta-aware of our experience in conversation helps invite a creative space or clearing to notice emerging meaning or knowledge. In this sense, generative dialogue participants learn to stabilize themselves at a position of meta-awareness that is at least "one level above habitual engagement" (Varela, 2000). If we look to the spoken discourse traditions of debate, the psychological pressure of debate tends to block the emergence of meta-awareness and vision-logic by keeping participants absorbed with the downstream content and context of a given argument. In my experience with debate, this tends to result in polarization of different perspectives, and a tendency to overlook the deeper assumptions underlying the differences or how the differences might be integrated. On the other hand, participants witnessing their reflexes of thought and emotion rather than unconsciously acting out and subsequently identifying with these reflexes characterize the later fields of reflective and generative dialogue. Similar to meditation practice, suspension offers a way station for the self to dis-embed from its habitual identification with the ordinary waking state of consciousness and re-embed within the witness self position. According to Jordan (2003), meta-awareness (like vision-logic) is an advanced form of cognition that can attend to and draw support from a variety of emotional, behavioral and thought content without identifying with such content as who one is and therefore is not prone to being lost in such streams of consciousness.

Emotional Line

In addition to cognition, another developmental line that is relevant to generative dialogue is emotional intelligence. Although many developmental lines develop in a relatively independent way, Wilber also regards developmental lines as "streams" (2000), which is helpful in the case of emotional intelligence, which relies on cognition as well as other neighboring developmental lines. In the field of reflective dialogue, participants begin to invite more relational ways of

---

intended to engage those practitioners who are interested in cultivating greater mastery of the capacities that support and enhance the emergence of generative dialogue.

[14] Thomas Jordan (2000) offers a definition of meta-awareness:

> Meta-awareness means awareness of the sensorimotor schematas, emotions, desires and thoughts that tumble through our being. Instead of being had by one's habitual behavioral patterns, emotions, desires and thoughts, meta-awareness means that there is a locus of witnessing in consciousness that can make the behaviors, emotions, desires and thoughts objects of attention (p. 33).

knowing and being through conversation that develop our capacity to embrace differently shaded emotions without necessarily repressing or expressing the emotional content. With practice, generative dialogue groups develop the capacity for a form of collective "emotional alchemy" (Goleman, 1997), where emotional pain is met with collective compassion and openness. However, depending on each individual's stage of development of emotional intelligence and other supportive lines (e.g., moral and cognitive intelligence), there will be a greater or lesser ability within the group to hold conflicting emotions well. Furthermore, generative dialogue develops an individual's capacity to embrace and allow for different shaded emotions, in turn making participants less prone to being emotionally reactive. Yet, once again, there will be individuals who have not yet developed their emotional lines to this degree and so rely on the modeling from others within the group who have. Further advanced forms of emotional intelligence enable participants to not only to imagine what one would think and feel if they were in someone else's shoes, but also to imagine what *another* person thinks and feels (Jordan, 2003). Higher levels of emotional intelligence enable people to be less tangled up and hooked by their own or other's emotions, which helps avoid the marginalization of creative processes through the "tyranny of intimacy" (Arnett, 1992, p. 32) and other forms of group narcissism.

Collective Intelligence Line[15]

The Next Buddha May be a Sangha – Thich Nhat Hahn

As participants explore the latter fields of generative dialogue, they develop the capacity to experience more *interdependent* processes of learning and thinking together. With sufficient practice and duration, participants learn how to sense, listen and think together from the shared source of emerging shared meaning that is arising through the present moment. In moving from the individual-oriented to the collective-oriented fields (i.e., transition from talking tough to reflective dialogue), the boundaries between participants begin to soften through empathic listening, and suspension of thought and judgment, which brings the personhood of the participants into the foreground. When the group passes the final threshold into generative dialogue, the practice of collective presencing gives way to newly emerging forms of *collective intelligence*.

Berkeley professor of cognitive science Eleanor Rosch describes this as a movement from analytic knowing to a form of wisdom awareness she describes as "primary knowing" which involves a "transformation from the subject-object-separation consciousness, towards an order of perception that happens from the whole field, not from within a separated perceiver" (Rosch and Scharmer, 1999, p. 21). According to Rosch, primary knowing requires developing the capacity to literally sense and align oneself with the source of the unclear knowledge emerging from the field itself. In learning to recognize and embody forms of primary knowing, participants develop the skills to support one another in cultivating fields of collective learning that increasingly rely upon collective attention, intention and capacity building within the fourth field stage of generative dialogue.[16] In spite of the absence of empirical research on the subject, interest in collective intelligence and collective methods for learning and thinking together has grown considerably within the past decade[17] (Hamilton, 2004).

---

[15] Though AQAL theory does not explicitly identify collective intelligence as a line of development, I have included it here as a preliminary conceptual exploration of both an individual and collective capacity of consciousness that may be later validated by empirical research.

[16] It is helpful to visualize the developmental line of collective intelligence as a developmental capacity of the collective interior (LL) of a group. While all groups can potentially experience different orders or

“States” of Consciousness

Wilber’s (2000) model of “states” of consciousness is derived in part from the world wisdom traditions as well as the more recent field of consciousness studies. According to Wilber (2006), the great wisdom traditions Vedanta Hinduism and Vajrayana Buddhism both maintain that the three *natural states* of consciousness—waking, dreaming, and deep dreamless sleep—correspond with three great *bodies* or waking *realms* of being (gross, subtle, and causal) in daily life. In both traditions, the bodies[18] are said to be the energy support of the corresponding mind or state of consciousness (e.g., the gross bodymind, subtle bodymind, and causal bodymind). Wilber uses the terms “gross,” “subtle,” and “causal” to refer to these three broad states of waking awareness, even though, technically, they refer to the energetic support of those states.

Within the context of generative dialogue practice, as a tentative orientating generalization it is my experience that each of these three states are roughly enacted with the three *transitions* from talking nice to talking tough; talking tough to reflective dialogue; reflective dialogue to generative dialogue. The *gross* bodymind or our conventional waking state is maintained from talking nice to talking tough to the extent that participants are still engaged within their discursive minds and have not yet begun to take a perspective on their own or the collective conversation. The shift from *gross* to the *subtle* bodymind is facilitated by suspension of thought and feelings in the transition from the field of talking tough to reflective dialogue. Opened through suspension, the subtle bodymind is stimulated when groups and individuals slow down to make in-the-moment contact with their thought processes and underlying source. This shift is also similar to what takes place in meditation where one moves from being subject to one’s thoughts, emotions and consciousness to witnessing these contents both individually and as a collective. Finally, with presencing, my experience is consistent with Wilber’s claim that “presencing” evokes the “causal state” (Wilber and Scharmer, 2004) inasmuch as presencing calls upon the spacious and vast *causal* bodymind. Here participants begin to experientially make contact with the threshold of emergence, which gives rise to manifest thoughts, ideas, and intuitions that begin to crystallize in our awareness.

Again, considered in the light of provisional orientating generalizations, these “state” shifts become particularly interesting when viewed from the four quadrants. For within the previous distinction of *GD cultures*, groups go through these state shifts bringing about a movement from

---

levels of collective intelligence, some groups are invariably more creative or intelligent than others. Partly this is due to the capacities individuals bring to the field of conversation, but partly also the collective capacities of a group to cycle through Scharmer’s model of generative dialogue and to embody collective wisdom.

[17] For a helpful overview of the field of collective intelligence, I recommend consulting Craig Hamilton’s (2004) groundbreaking article *Come Together: The Power of Collective Intelligence* in the May-July 2004 issue of *What is Enlightenment.*

[18] According to Wilber (2006), for the wisdom traditions, a “body” simply means a mode of experience or energetic feeling. So there is coarse or gross experience, subtle or refined experience, and very subtle or causal experience. In other words, these are *phenomenological realities* that present themselves to our immediate awareness. While everyone has access to all their bodies and the energy of each of these bodies, Wilber notes that not everyone is present to these bodies in the moment.

their *collective* gross bodymind to their *collective* subtle bodymind to their *collective* causal bodymind. More recent theorizing within the emerging field of collective intelligence indicates the formation of a "group bodymind" (Bohm, 1996), "co-intelligence" (Atlee, 2003a, 2003b) or "collective mind" (Hamilton, 2004) when vital thresholds of group experience are crossed. However, none of these collective metaphors take into account the respective shifts in the group *state* of consciousness, leaving out a vital dimension of individual and collective experiences. With the distinction of *states*, we bring attention to the correlative shifts of participants' consciousness in relation to the unfolding field dynamics of conversation and the gesture of moving back upstream to the source of our experience (as depicted in the opening quote).

Just as Wilber (2006) has pointed out, more frequent movement through *state* changes facilitates and quickens the development of *stages* along different developmental *lines*. In this way, generative dialogue, like other methods of collective intelligence[19] can serve the role of an intersubjective (LL) yoga that facilitates individual's temporary change in *state* of consciousness, which over time can help participants develop enduring levels of consciousness along different lines. Experiencing these deeper states in group conversation as a vitalizing dimension of the conversation can help catalyze profound motivation and meaning in the process of conversation as a co-creative practice. As gateways to the temporary emergence of transcendent states of being that often evoke deep feelings of sacred connection with life and the greater cosmos, my experience is that helping groups identify and access these states brings forth the dormant gross, subtle and causal realities that accompany these states.

From experiences facilitating and participating in generative dialogue groups, I have found the framework of *states* helpful as a set of distinctions to recognize and name these state-shifts in their moment-to-moment experience. As Wilber (2003b) frequently comments, regular meditation practice also helps us learn to dis-identify with the *gross* contents of consciousness and in turn free up attention for *subtle* or *causal* contents/realities:

> As meditation deepens, different contents tend to arise, often moving from gross contents (objects of the senses and mental representations of them) to subtler contents (visions, illuminations, bliss) to very subtle or causal contents (vast formlessness, consciousness without an object) (p. 1).

Contemplative practices such as meditation[20] offer an *intrapersonal* (UL) practice for individuals to experience a shift in their *state* of consciousness. As a complementary *interpersonal* (LL) practice, generative dialogue offers a venue to bring about shifts in the gross, subtle and causal *states* of consciousness through conversation. From this perspective, an objective of generative dialogue practice is not to leave behind the conventional or gross states of mind or to label them as egoic and therefore a hindrance. Rather, it becomes important to cultivate the flourishing of all states and their respective bodyminds as portals to a more integral understanding of multiple depths of reality as it unfolds and is co-created through conversation. Consistent with the Vedantic tradition, Wilber (2003a) refers to such a state as “Turiya,” which is the ability to simultaneously *witness* and *experience* all three states and bodies of the gross, subtle and causal. Recognizing that every state has its relative value, but that learning to individually and collectively embody deeper states offer more relative value gives credence to Scharmer’s (2000) reflection on a conversation with Bill O’Brian, “the success of an intervention depends on the interior condition of the intervener” (p. 1). Given that each state of consciousness contains a distinctive self-sense, level of reality and scope of sensitivities, activating deeper collective states through the generative dialogue process invites participants into heretofore unexplored frontiers of knowing, learning and being.

---

[19] Other intersubjective methodologies of collective intelligence include Roshi's (2006) *Big Mind*; Cohen's (2004) *Enlightened Communication*; among others.

[20] Wilber (2003b) elaborates on the relationship between different types of meditation and connection with states of consciousness:

> For example, in a type of meditation known as savikalpa samadhi (or mediation with an object of awareness), one can directly (while fully awake) experience the higher reaches of the subtle realm; in states of nirvikalpa and jnana samadhi, one directly experiences the causal realm; in states of sahaja samadhi, one directly realizes the nondual (which we will discuss in a moment). In all of those cases, one is developing one's capacity to experience higher states by converting them into *permanent acquisitions*. States that are normally unconscious have been made conscious; states that are normally temporary have been made permanent (p. 10).

Closing Remarks

As this article outlines, an AQAL interpretation of generative dialogue introduces several new distinctions for GD practitioners to broaden and deepen the scope of their practice. Given the respective influences of the different dimensions of our consciousness within the four fields of conversation of Scharmer’s model, this article initiates a preliminary inquiry and positing of directions to inform further theorizing and research within various contexts of GD practice. Future generative dialogue practitioners will benefit from considering different possibilities for how AQAL interpretations can advance the capacities and potentials of existing groups. Finally, it is my hope that this article will inspire the continued development and refinement of generative dialogue as a transformative practice within the emerging field of collective intelligence.

How I Lost My Mind and Found the Meaning of "Life"

Herb Koplowitz

Abstract: By integrating philosophical rigor with practical examples and personal history and revelation, the author shares how he ended his quest to understand the concepts of life, mind, and soul and resolved the mind-body problem. The article relates the key insight garnered from Elliott Jaques that triggered a new, internally-consistent conceptual framework or paradigm. Founded on a unitary organism model of life, it replaced the mind-body-soul model. The logic of the new conceptual framework is developed through brief, methodical discussions that juxtapose *choice and judgement* with calculation, Newtonian physics, randomness, and self correction. The paper is grounded in the premise that our attempts to answer a question (e.g. "How do we think and judged?") are hindered by accepting an entity (e.g. mind) whose only evidence is that the question exists. On that foundation, unitary arguments trace the author's dissolution of concepts of mind, body, and soul and the spiritual. General implications of this framework are then applied to terminology and to the origin of life, abortion, and trading one duality for another. In relating some personal implications of this framework in daily life, the author makes the case for the value of simplicity in conceptual frameworks and the clarity that can result.

Keywords: body, choice, dualism, Elliott Jaques, judgement, life, mind, mind-body problem, organical, organism, organismic, soul, unitary

Introduction

I have puzzled about the concepts of life and mind since I was in high school. I suppose I am in good company as philosophers and scientists have been working on these problems for a long time. The mind-body problem, for example, was around before Descartes wondered how a material body and immaterial mind could affect each other. Nothing I read in Western or Eastern approaches really made sense to me. Then, nearly ten years ago, I was given an insight about mind that immediately ended my quest for an understanding of that concept and also gave me clarity about life and soul and, along the way, even changed my understanding of body.

This paper shares that insight and its implications in the hope that the clarity I have gained for myself may be of benefit to readers who might have had the same puzzles that I have had. You may not come to share my point of view, but I hope there is enough clarity in my writing to help you rethink your own.

I will need first to explain the epistemology underlying this paper. My approach to knowledge leads me to consider this paper to be a quest for sense, not for truth. This will set the stage for briefly explaining what had been so dissatisfying for me in what I had read earlier, sharing the insight, and stating what it did for me. I will then explore, in turn, what the insight did for my understanding of the concepts of life, choice, mind, body, and soul. I will close by describing how my new understanding changes how I now think about issues as diverse as the origin of life on earth and on abortion.

SOME RIGHTS RESERVED

Underlying Framework

The framework for this quest comes from my understanding of Thomas Kuhn's *Structure of Scientific Revolutions* (1962). Kuhn described two distinct activities in science. In "normal science," one extends the range and accuracy of causal laws and facts (e.g., how many species of monkey there are) about some domain of the world (e.g., zoology). In "revolution," one changes the paradigm, the approach one takes in doing normal science (e.g., Darwin's developing the formerly unthinkable concept that a species may develop into a different species). I understand a key aspect of paradigm to be the conceptual framework, the system of concepts through which laws and facts are formulated. As another example, the revolutionary work of Piaget (1971a, 1971b), the Swiss psychologist, was to develop the paradigm he called "genetic epistemology," essentially, the understanding of knowledge as something we construct rather than copy from reality. His paradigm includes such concepts as schema (essentially, a concept), assimilation (interpreting data to fit one's concepts), accommodation (changing one's concepts to fit the data) and equilibration (keeping one's concepts and one's data consistent). When he explored the development of mathematical understanding in children, he was doing normal science.

As I understand it, normal science is the pursuit of objective truth, that which is observable by anyone. Piaget took a ball of clay and rolled it into a snake in front of children of various ages. He observed that a child will, when younger, believe there to now be more clay than there was before and that later in development the child will believe the amount to remain unchanged. Anyone can observe this same fact. It is the observability that makes normal science testable, falsifiable.

But a conceptual framework is a means of making sense of data and is therefore not testable through data. As a psychology graduate student, enthralled by Piaget's model of how we are genetically programmed to mature through a series of stages, I found to my frustration that no fact could convince my behaviourist office mate of the error of his beliefs that environment determines everything psychological. He assimilated everything I said to him to his own behaviourist framework. I now see that he was not wrong but just looked at things differently from how I looked at them. We could argue about which way of looking at things made more sense, but there is no objective means of deciding between the two paradigms.

Think of that gestalt drawing. If I show you how this line outlines the young woman's chin, that will not necessarily alter your view of the drawing as one of an old woman and the line as outlining her nose. The function of a conceptual framework is to help us make sense of data. Kuhn has shown to my satisfaction (though not to that of his critics) that the decision of which of two conceptual frameworks does the job better is subjective.

This paper describes a particular conceptual framework for making sense of psychological data commonly described using words such as "life," "mind," and "soul." My purpose is not to prove the truth of the framework as I do not believe conceptual frameworks are the kind of thing that is provable. Rather, I wish to share how this conceptual framework helps me make better sense of issues that were previously puzzling to me. I shall begin by briefly describing what puzzled me, the insight given to me, and what I mean when I say that the insight resolved the puzzle.

Puzzles, Insight and Resolution

I do not recall if I ever thought of the brain as what thinks. I am fairly sure that in university, if not in high school, it was clear to me that the brain is a piece of meat. It is clearly essential to thinking, as the telescope is essential to astronomy. But it is not the sort of thing that would do something like think anymore than a telescope is the sort of thing that would do something like see. So I assumed it must be the mind that thinks, but this only raises the question of what the mind is.

My first clue that the concept is troubled was that writing is always clearer and more descriptive regarding the adjective “mental” than the noun “mind.” The indices of Piaget’s books, for example, are rife with references to mental activity, exercise, experience, experiments and operations, but of the 29 indexed books of his in my library, only one (1973) has “mind” in its index. Even books with “mind” in their title, e.g., *Frames of Mind* (Gardner, 1983) or *A Whole New Mind: Why Right-Brainers Will Rule the World* (Pink, 2005) may not have the word “mind” in their index.

There are, of course, explicit models of mind. Freud’s concepts of id, ego, and superego form a model of the mind. And in the East, most schools of yoga I have studied have mind as a constituent part of a person along with soul, body and life force. (Some even have two minds, e.g., a sensory mind and a thinking mind.) But what I read of these models was more descriptive of what the mind does than of what the mind is. None of it solved the mind-body problem, how a material body and an immaterial mind can affect each other, let alone how a person’s soul can survive their death.

Life, too, was a concept that puzzled me. I recall reading articles defining life as that which reproduces itself. But the same articles always noted that fire, too, reproduces itself, showing that the definition missed the mark. Davies (2002) has refined that definition, saying “Today, life is regarded as an immensely complex information processing and replicating system.” But even if my lap top and my wife’s PC could make the beast with two backs and thus produce a calculator, I would not consider them to be alive.

And then there was the phone conversation with Elliott Jaques in 1998, give or take. Jaques (1996) was co-creator and major developer of Requisite Organization, an approach to designing and managing organizations that I use in my consulting, and I was fortunate to have a collegial relationship with him. (He is better known for coining the term “mid-life crisis.”) I forget what we were talking about, but he mentioned that he no longer used the term “mind,” that he did not find it useful. What thinks? I think. With what do I think? Well, with what do I live? It is just I who lives and just I who thinks.

This was a transforming moment for me. I felt that a quest had ended, that a puzzle had been solved. When he gave me that nugget, it exploded—not in my brain, not in my mind, but in me—and I could see my way clear through issues that had entangled me for years. Ironically, I gained clarity about “mind” by losing the concept. Moments later, a second puzzle was solved for me. I realized that if I do what I used to think my mind does, perhaps I also do what I used to think my soul does. I immediately understood myself to be all I had, and if I am made up of parts they are not mind and body and soul. (Jaques’s 2002 *Life and Behavior of Living Organisms* expands on the resulting view of the organism.)

I learned a new conceptual framework for mind and soul, one that for the first time made sense to me. That led to a different way of talking about life and related phenomena. Let me now unfold that framework and describe that language. It will be useful to start with life and what only living things can do. That will lead to a model of unitary person or, more generally, unitary organism, which I will contrast with a body-mind-soul model. I will then examine implications of the change of model for several issues.

What Is Life?

Jaques's point was that the organism does what we typically say the mind does. I would include in that list verbs like "feel," "want," "intend,"[1] "judge," "choose," etc. To me, it is clear that only living things do them. When the door squeaks, we may say that the hinge wants oil, but this is a metaphor. The hinge does not feel dry, want oil, intend to get oiled within the hour, judge which is the best way to get oiled, choose that way to act, squeak with the intention of getting oiled, nor search for another way to get oiled if squeaking does not succeed. I hope the contrast is clear between the hinge's "wanting" oil and my wanting peanut butter chocolate ice cream. I do feel hunger, want ice cream, intend to get some within ten minutes, judge which is the best way to get it, choose that way to act, go to the freezer with the intention of getting ice cream, and think of how to get some if the freezer is devoid of it. I use those verbs literally, not metaphorically. Changing the example of a hinge to one of a computer does not change the metaphorical nature of the use of those words. Computers, no matter how complex, do not want, judge, choose, intend or feel.

Realizing that feeling, wanting, intending, judging, and choosing are peculiar to living things made me realize that a living thing is anything that judges and chooses. (I could have chosen the verb from any in that list of gerunds.) I am absolutely clear about this in the animal world. I understand all animals to judge and choose, all animals including humans, apes, cats, goldfish, bees, and even amoebas. I cannot look at a worm and see a mechanism whose behaviour is completely explicable by Newton's laws and the laws of chemistry, nor one that deviates from those laws only through randomness.

I expect the same is true of plants, though I do not have the data to feel as sure or to give as many examples. I believe our choice of grammar is descriptive when we say that a tree puts out roots, that this is an action on the part of the tree. And it just does not make sense to me that chemistry and physics totally explain whether a root goes left or right around a rock. It makes more sense to me that this is a choice the tree makes.

Judgement and Choice vs. Calculation, Newtonian Physics, Randomness, and Self Correction

We speak of "artificial intelligence" and refer to computers as "thinking machines," as though computers can do what we say the mind does. So it may be useful for me to explain more about what is unique about living things. Jaques (Glossary, 1996, p. 140) defined "judgment" as:

> The weighing up of the factors in a problem, interplaying verbalizable knowledge and data and non-verbalized mental processing in relation to each other, in trying to arrive at a decision. (Note this was before he gave up "mind").

---

[1] I use "want" to refer to a state of incompleteness that the organism wants rectified. "I want a better wardrobe" means I feel short of some clothes and wish to get some more clothes. An intention is a specific, time-bound means of filling the need. "I intend to get two business suits within a month."

I am not sure how helpful I find that definition, but the concept of "judge" like the concept "see" is so fundamental that it resists useful definition.

I shall compare judgement and choice—hallmarks of life—with calculation, Newtonian causation, randomness, and self-correcting mechanisms.

Calculation vs. Judgement and Choice

Computers calculate, taking inputted data, processing those data through rules set by the programmer, and displaying the results. It is all very logical. Of course, the calculations computers are capable of have become faster and more complex, but thinking is not complex calculating. Calculations have right answers. Put in 2 + 2 and the result had better be 4. Any two computers performing the same calculation will come up with the same answer, or at least one of them is wrong. But when I choose strawberry ice cream and then say it was a mistake, I do not mean that I made a factual error but that it turns out that I would have preferred a different flavour. In the most complex decisions, we count everything we judge relevant to count, measure everything we judge relevant to measure, and perform all of the calculations we judge relevant to perform. We then interpret the results and make our choices. We do not know our reasons for making the choices we make; Freud created an industry on this insight. In most instances, computers are far better at calculation than we are. But we judge and choose. I cannot imagine how a computer would judge or choose.

Newtonian Physics vs. Judgement and Choice

In the late 17th and early 18th centuries, Sir Isaac Newton laid the foundation for all of modern physics. He concerned himself with objects that stand still or move no faster than everyday objects move and which are large enough to be visible and tangible to us, no smaller, say, than a ball bearing but as much larger than that as you would like, even as large as the moon, earth and sun. Newton formulated laws that have been very successful at predicting the movement of such objects under prescribed conditions. Drop a ball bearing from a given height inside a long tube that has had all the air removed from it, and his laws predict with great accuracy how long it will take the ball to fall. Great accuracy, but not total accuracy. If we get our measuring devices fine enough, we will always find random error, some small variation from the predicted time. This is treated as something of a nuisance, the unavoidable effect of a little bit of air's having entered the tube or of a nearby earthquake which moved the bottom of the tube up by a tiny amount, thus shortening the fall of the ball bearing by a small amount.

The conceit in Newton's physics is that if we could just get the conditions perfect, the laws would predict with *absolute* accuracy how long it would take the ball to fall. Einstein took Newton's laws and extended them to cover also objects that move much faster than everyday objects do, even as fast as light moves. This produced subtle but important changes in Newton's laws, but did not alter the assumption that the movement of objects could be predicted with total accuracy, theoretically at least. Einstein was said to have declared, "God does not play dice with the universe."

It is clear that human behaviour is not as predictable as the movement of ball bearings. Simply by knowing a few facts such as the size and shape of a ball bearing, the slope of a ramp, and the coefficient of friction between the ramp and the ball bearing, a physicist can predict with great accuracy how long it will take the ball bearing to roll down the ramp. But if you know my size and shape, the slope of a ramp and the coefficient of friction between the ramp and my shoes, you will not be able to predict how quickly I will go down the ramp. You may be able to predict that the prospect of a free peanut butter chocolate ice cream cone will increase my speed, but if I am dieting it might actually drive me back up the ramp. Whatever type of cause and effect drives my behaviour, it is surely different from the causation Newton described.

Randomness vs. Judgement and Choice

At the same time that Einstein was extending Newton's exploration from the relatively slow to as fast as possible, Heisenberg, Plank, Bohr and others were extending the exploration to the very small, developing a field they called "quantum mechanics." Quantum mechanics differs from Newton's laws, among other ways, in that it holds randomness to be an essential element of the world. When we get as small as a photon, a single particle of light, we can calculate how likely it is that the particle be in a given location at a given time, but we do not know exactly where it will be when.

It would be tempting to tie my unpredictability to quantum randomness as though computer-like processes drive my walking down the ramp with quantum randomness keeping the result from being totally predictable. But organisms are not mechanisms with quirks. You can predict that given the option of peanut butter chocolate and any other flavour of ice cream, I will go for the peanut butter chocolate 99% of the time. But that 1% when I choose something else is not random error. It is because I enjoyed pistachios yesterday and wanted to remember what pistachio ice cream tasted like; or I was cooking with vanilla this morning and was reminded that good vanilla is a rich, deep flavour, and not the absence of flavour; or something in the ice cream shop was reminiscent of something from my childhood—maybe something I am not even aware of that leads me on a whim to ask for strawberry.

Organisms do not act in Newtonian fashion, and adding randomness to Newton does not help.

Self Correction vs. Judgement and Choice

Cybernetics is the study of self-correcting systems, like the thermostat which keeps your house at the desired temperature regardless of the effects of weather. Your thermostat turns on your furnace when your house gets too cold and then turns it off when it is warm enough. It is tempting to link this with the kinds of corrective actions you take in pursuit of a moving target.

The similarities are interesting and have been put to good use in General System Theory (Bertalanffy, 1968) and its applications to human systems such as families (Watzlawick, Bevelas, & Jackson, 1967). Your house's thermostat is a homeostatic mechanism, a device or processes that maintains a norm; so is the way you choose your clothes, warmer ones in winter and lighter ones in summer, to keep your own temperature within a comfortable range. But there is a significant difference between the two. Your house's thermostat does not intentionally act to keep your house at the desired temperature. Rather, it responds to signals exactly as it is programmed to do. If December weather turns unexpectedly warm, uncomfortably warm, your thermostat does not think to turn on the air conditioner. You, on the other hand, will think to pull some summer clothes out of the closet if you are heading for 32 C. weather in Puerto Vallarta. You may also choose to wear a warmer outfit there instead, even though it does not suit the weather, because you will look and feel so right in it at that event.

Your thermostat corrects by following the rules, and if the rules lead it astray from keeping the house at the right temperature, it follows the rules anyway. But humans, and all organisms, are goal driven, not process driven. Of course, you may assume that the thermostat is going to look after the house temperature, and you may allow the house get uncomfortably cold before you take notice and turn the breaker on that the electrician mistakenly left off four hours ago, but you will eventually notice that the house is cold and you will take some action to get it warm again.

Framework

Again, this is an issue of conceptual framework. If it makes sense to you that the unpredictability in my behaviour or yours is like the unpredictability in the movement of a photon, I can give you no scientific evidence to the contrary. I can ask you whether it makes sense to you that photons act outside the law because they change their intentions, if you understand they no longer to want to move left as Newton's laws would predict. But if that is how you make sense of the world, there is no counter evidence that would compel you to change your point of view. As Kuhn (1962, p. 148) said, "The competition between paradigms is not the sort of battle that can be resolved by proofs."

The Mind

What does those things: want, judge, choose, intend, feel, etc.? Previously, I would have said we do them with our minds. I understood mind as the agent of all actions peculiar to living things (except, perhaps, for the strictly biochemical). And this is a common point of view:

- "This book was brewing in my mind over a period of probably nearly twenty years." (Hofstadter, 1980. p. xix)
- "From the start, the [pasta] station was a test of the mind's capacity to hold many things in place without ever having to think about them." (Burford, 2006, p. 120)
- "Now…imagine that your mind wanders away, gets lost, and never comes back." (Gilbert, 2006. pp. 66-67)

In that single moment in that conversation with Jaques, I understood "mind" not to add any meaning or explanation in those sentences. Now I would say:

- "I have been thinking about this book over a period of probably nearly twenty years."
- "From the start, the [pasta] station was a test of the cook's capacity to hold many things in place without ever having to think about them."
- "Now…imagine that your attention wanders away, gets lost, and never comes back."

To specify that the actors in these three scenarios took these actions with their minds adds no new information. Losing my mind has given me only clarity and simplicity. The second set of sentences expresses everything that the first set does and just as clearly, but without use of a phantom entity. "Mind" is used as though it explains how we think, but it only serves to name that which we do not understand.

Science will, with some frequency, hypothesize a substance to account for a phenomenon it cannot otherwise explain. Chemists first used a substance they called "phlogiston" and later one they called "oxygen" to explain fire. Physicists hypothesized a substance they called "ether" to explain how light waves could travel in a vacuum. Sometimes, as in the case of phlogiston and ether, the hypothesis does not pan out; scientists were never able to produce phlogiston or ether, contain it in a jar and find effects it had other than the phenomena they were invented to explain. Sometimes, as in the case of oxygen, the invented substance pans out; we can separate it out from air, put it in a jar, weigh it, combine it with other substances, etc.

It is part of scientists' job to explain natural phenomena. Sometimes they hypothesize substances in the process but, as scientists, they then test the hypothesis. Science is not advanced by explaining fire as the result of phlogiston if the only evidence of phlogiston is that there is fire. That would simply be naming what was not understood and treating the name as though it explained what is not understood.

Jaques referred to forming intentions, judging and choosing as "work," organical (see "Terminology" below) work as opposed to the mechanical work that Newton studied. We do not know how we form intentions, judge and choose. Jaques (2002) referred to how we work as "ineffable:" not observable and not describable. Of course we are learning more and more about how the brain works and we are learning which parts of the brain are most active when we are engaged in various activities peculiar to living things. But biochemistry does not explain wanting, forming intentions, judging, and choosing in the way that physics explains the actions of a computer. A thought may be accompanied by the passing of a nerve impulse across a synapse, but the thought is not the same thing as the passing of the impulse. A memory may be lost when a part of the brain is damaged, but a memory is not that part of the brain nor any chemical or electrical arrangement of a part of the brain. No combination of chemical or electrical phenomena make up a thought, a memory, or desire in the way that an atom of sodium and an atom of chlorine make up a molecule of salt.

One more time, the issue under consideration is one of conceptual framework, not of normal science. I am offering no evidence of causal laws previously unknown. I have not invented a mindometer, placed it against a large sample of humans and found it always to register zero. The data that convince me to consider "mind" as a place holder, a word with no referent, are all consistent with a framework that includes "mind" as an entity; I simply find that those data make more sense to me now that I have no mind. And it makes sense to me that all living things—even amoebae—are much more similar to humans than they are to rocks or computers; all living things, and only living things, feel, want, intend, judge and choose.

The Body

If I have no mind, I have no body either. What would the "I" be that would have a body and what would be left over of the "I" when the body is taken away from it? Analysis leaves just me, not a body and a mind, one corporal, the other ethereal, mysteriously interconnected.

- Not "My body is fat" but "I am fat."
- Not "I have my father's body" but "I'm built like my father."
- Not "I love looking at her body" but "I love looking at her."

Of course, I still have a liver and skin and a stomach, etc., but they do not all add up to a material part of me that is inert until it interacts with my immaterial mind to make me, the person. You cannot lose your mind without also losing your body. My body will exist, but only when I die. At that point, I will cease to exist, and all there will be is my corpse.

Soul and the Spiritual

Soul only became of interest to me once I started studying yoga. (My Jewish upbringing was long on ethics and short on theology.) I have tried to understand what is meant by "soul" or the "spiritual" nature of humans. I believe that when people talk about soul, they address phenomena at three levels:

- the intrapersonal,
- the interpersonal,
- the extra normal.

The *intrapersonal* is what "spiritual" practices such as meditation are said to do for the individual: physical health, mental health, feelings of centeredness, stilling the mind, feeling connected to others, etc. My own experience with these practices was just sufficient to give me a flavour of their potential. I believe these practices are calming and centring. I would not say they still the mind because I am not aware of anything I would want to call a "mind." And I do not believe they stop the process of judging because I believe that is ongoing from birth (or earlier) to death. But I do expect that someone deep in meditation has left the verbal world. They are not trying to re-work the past, they are not caught up in current emotions, and they are not worrying about the future. I expect such disengagement from emotional turmoil would have enormous benefits not only during meditation and immediately afterwards but also potentially throughout the day as one becomes skilled at focusing on what one wants to focus on rather than getting caught in distractions. None of this requires a concept of soul to understand it.

The *interpersonal* is how we feel about and act towards others. Spiritual teachings encourage us to treat others with respect and care and spiritual practices are said to make such behaviour easier. I find these claims credible, but I do not find a need for soul to make sense of beneficial interpersonal relationships. I expect that the survival of any species requires its members to be, on the whole, supportive of each other.

By *extra normal* I mean what may happen beyond the worlds of physics, chemistry and biology (biology understood to include psychology). This includes:

- telecommunication, giving or receiving messages directly soul to soul;
- action at a distance, such as healing someone by thinking of them or praying for them without giving them a physical or chemical treatment or at least informing them that one was going to do this;
- survival of the soul after death as suggested by communication or actions taken from beyond death.

These cases would establish the soul for me as an entity as they are beyond the explanatory capabilities of physics, chemistry and biology. Of course, a paradigm may not be changed just because of one inconvenient fact, but the weight of evidence, a number of anomalies that cannot be accounted for in my conceptual framework but can in another, might lead me to change my understanding of soul. However, I have no convincing evidence that such phenomena happen. I have heard many anecdotes of healing at a distance or of causing a distant object to become heavier, but nothing with the kind of controls that would make those claims credible to me.

Implications

I have described how considering "mind" to be a myth, a place holder, changed my concepts of life, body and soul. But it has had effects on in a number of other areas as well. I find no order or pattern to the implications I am aware of, so I shall simply address them one at a time, concluding with the most personal ones.

Terminology

I have used the phrase "peculiar to living things" in place of what I would previously have called "mental" to describe wanting, judging, choosing, intending, and feeling, and this raises the issue of terminology. When there is no "mind," there is no "mental." I have yet to find a term I can use to refer to what only living things do. Whatever the term is, it needs to relate to living things, to organisms, because that is what takes those actions.

We have no term in English for this. Jaques noted that in the non-living world, an aspect of a mechanism is called "mechanical," so it would make sense to refer to an aspect of an organism as "organical." He was aware that the term "organical" was unlikely to catch on but never found an adequate substitute for it. Von Bertalanffy (1968), the major developer of General System Theory, for similar reasons referred to aspects of an organism as "organismic" which has not caught on any more than "organical." It is easy enough to substitute a reference to the organism ("I," "George," "the dog," etc.) in place of "mind" in describing an instance of feeling, wanting, intending, judging, or choosing. But I lack an elegant way of specifying that the work I am referring to is the organical work, not the mechanical work.

Origin of Life

My understanding of the nature of life has changed my concepts regarding the origin of life. I used to be quite comfortable with the story that a lightning bolt struck a pool of chemicals, fusing some together in new ways, thus creating life. That story just does not make sense to me now because I do not see how life can come from non-life. I could see developments in micro-technology that would allow us some day to build a human corpse from scratch. But I do not get how we could ever start from constituent chemicals and build a living amoeba that feels peckish, wants to consume something, intends to do so within the next five seconds, judges which particle to pursue, and choose to extend a pseudopod just so to capture it. Evolution, the development of new species from older ones, is not at all problematic; this is simply something that has intentions coming from something else that has intentions. But I do not see how something with wants and intentions can come from something without intentions.

If living things are essentially different from nonliving things and life cannot come from non-life, then how did life begin? Jaques used to say, only half jokingly, that in the beginning was life, some of which died in the big bang. My own understanding is informed by Wittgenstein's

(1961, p. 149) statement “It is not *how* things are in the world that is the mystical, but *that* it exists.”

I have always understood him to be saying that if you are going to have a world, it will have some characteristics, some shape, some order to it. The order itself is the subject of science, and so we can ask why gravity exists and why it attracts rather than repels. These are interesting questions for science, and the answers will only raise more questions. The mystical, that which is beyond science, is why there is a world at all. Science can explore the nature of existence but not its cause. How existence itself came about is beyond science.

I believe the same is true of life. I do not see science explaining the origins of life any more than I see it explaining the origins of existence. Wittgenstein had one mystery (existence); I have two (existence and life). While evolution, development of new species from others, makes perfect sense to me, I have more empathy than I used to for the creationists’ doubts about the scientific explanations of the origins of life.

To be clear, those doubts do not drive me to a religious explanation. I am no better off with a god whose origin I cannot explain than with a phenomenon that I cannot explain.[2] I am quite content to leave life’s origins as a mystery.

Abortion

Prior to my insights about mind and life, I was unable to answer the question of when a human life begins. But new thinking about what life is led to new thinking about when a life starts. Now that I consider a living being to be something that feels, wants, intends, judges and chooses, it is clear to me that a fetus is a live human being from the moment it moves spontaneously and perhaps even from conception. This is a most inconvenient understanding for me as it upsets my easy, earlier understanding about abortion.

I still believe that murder lowers trust in a society. But it was clear to me, and remains clear, that we all need the right to remove from us whatever we do not want on or in us whether that be a kidney stone, a tattoo or a fetus. I share Judith Jarvis Thomson’s (1971, p. 51) belief that “having a right to life does not guarantee having either a right to be given the use of or a right to be allowed continued use of another person’s body--even if one needs it for life itself.” (I would now refer to “continued use of another person”.)

I am still working my way through this issue. While I find no doubt that women need the right to remove an unwanted fetus from themselves, I can no longer brush away the concerns of those who argue for the rights of the fetus.

Trading One Duality for Another

I have said that the issues in this paper are conceptual framework issues rather than science issues so that evidence will not resolve disagreements. A rule that philosophers use in cases like this is Occam’s razor: choose the simpler of two explanations. The mindless approach appears to be the simpler one. Philosophers and scientists have wondered how an immaterial mind can get a material body to move and how damage to a material body can cause pain in an immaterial mind.

---

[2] I do respect those whose religious beliefs are grounded in their own direct experience of God. Not having had such an experience, it would be empty of me to assume a god just to have an explanation for life or existence.

Jaques claimed, correctly, I believe, to have solved the mind-body problem: no mind, no body, no problem. But in so doing, he created another dualism: living matter vs. non-living matter. For western science, the living organism is composed of chemicals in the same way that non-living matter is. The rules of physics and chemistry apply to our livers as much as they do to our coffee tables. But the point of view I am espousing claims an essential difference between me and my coffee table. We can turn me into something dead, but cannot turn the coffee table into something alive. Nor can we bring life to a computer or to chemicals in a test tube. The effect of the phone conversation was not to make my thinking less dualistic but to trade one dualism for a different one. I started the conversation with Jaques with one type of matter and a mind-body problem, and ended it with no mind-body problem but with two types of matter: living and non-living.

Personal Implications

Losing the concept of mind has had a number of more personal effects on me. The clearest, most significant effect has been philosophical clarity. That one conversation with Jaques has brought much into focus for me that was previously puzzling. What is the mind, what is life, when does human life begin, what is the nature of soul? I have answers to these questions that make sense to me now. How did life begin, how do we exercise judgment? I am now comfortable not having answers to these questions. Philosophical clarity is a quality whose significance depends on how philosophically inclined one is. I take great satisfaction in finally being clear about what mind and life are and I believe I can now think, speak, and write about organical phenomena more clearly than before.

The other effect of the insight is that it leads me to think, write, and speak more responsibly and to experience my accomplishments, my very life, more immediately, not mediated by a brain or a mind. I will illustrate this first with another concept that was clarified by the insight I have described. “Important” was a troubling word for me going back to my adolescence. I was told that dressing well, getting good grades, going to synagogue, etc., were all important, but I could not figure out what “important” meant. These were things I did not want to do, and I could not grasp the property they all were supposed to have in common, importance. I now realize that “Getting good grades is important” means “I want you to get good grades” or perhaps, “Getting good grades is necessary for you to have the kind of career I want you to have.” By describing actions or their results as “important,” those in authority deny their own responsibility, their own values as desires, as the motivation for attempting to change others’ behaviours. Only an organism wants, and the word “important” masks the role of some person in wanting a particular outcome.

Writing that depersonalizes is quite common. Consider this statement, referred to earlier in this paper: “having a right to life does not guarantee having…a right to...the use of…another person’s body” (Thomson, 1971, p. 51)

Compare it to: “having a right to life does not guarantee having… a right to…the use of… another person.”

It is the woman, not her body, which carries the fetus. But we do not seem to be asking as much of the woman if we require her body, not her, to carry it. (And similarly, abortion feels like an action with less consequence if we do not consider it to end the life of a person.)

And consider these sentences:

> If you were asked to name the human brain’s greatest achievement, you might think first of the impressive artifacts it has produced – the Great Pyramid of Giza, the International Space Station, or perhaps the Golden Gate Bridge. These are great achievements indeed, and our brains deserve their very own ticker-tape parade for producing them” (Gilbert 2006, p. 5).

Compare it to:

> If you were asked to name humanity’s greatest achievements, you might think first of the impressive artifacts we have produced – the Great Pyramid of Giza, the International Space Station, or perhaps the Golden Gate Bridge. These are great achievements indeed, and those who built them deserve their very own ticker-tape parade for producing them.

It is humans, people, not their brains nor their minds, who built that pyramid, space station and bridge. To give credit to brains or minds takes credit away from persons.

I no longer depersonalize accomplishments and burdens as I used to. The added responsibility comes from understanding that *I* do all that I do. I cannot blame my bad decisions on my mind or on my brain nor lose credit to them for my good decisions. They were good or bad decisions that *I* made. And similarly, *I*, not my mind or my brain, wrote this paper, designed that training, maintained an interest in epistemology for all of these years, and so on. The insight makes my accomplishments, my very life, more immediate to me, not mediated by a brain or a mind. I hope this also makes me more caring in my actions towards others realizing that it is a person, not a mind or a body, that I affect.

The insight gives me simpler, more descriptive language. I am persuaded by Orwell’s (1946/2000) view that “…if thought corrupts language, language can also corrupt thought (p. 357). …If you simplify your English, you are freed from the worst follies of orthodoxy…and when you make a stupid remark its stupidity will be obvious, even to yourself” (p. 359).

Transdisciplinarity: Basarab Nicolescu Talks with Russ Volckmann

Basarab Nicolescu (b. March 25, 1942, Ploieşti, Romania) is a theoretical physicist at the Centre National de la Recherche Scientifique (CNRS), Laboratoire de Physique Nucléaire et de Hautes Énergies, Université Pierre et Marie Curie, Paris. He is also a Professor at the Babeş-Bolyai University, Cluj-Napoca, Romania, and Docteur ès-Sciences Physiques (PhD), 1972, Université Pierre et Marie Curie, Paris.

He is the President and founder of the International Center for Transdisciplinary Research and Studies (CIRET), a non-profit organization with 163 members from 26 countries. He is the co-founder, with René Berger, of the Study Group on Transdisciplinarity at UNESCO (1992) and the founder and Director of the "Transdisciplinarity" Series, Rocher Editions, Monaco, and of the "Romanians of Paris", Oxus Editions, Paris.

He is also a specialist in the theory of elementary particles and is the author of more than one hundred thirty articles in leading international scientific journals, has made numerous contributions to science anthologies and participated in several dozen French radio and multimedia documentaries on science.

Basarab Nicolescu is a major advocate of the transdisciplinary reconciliation between science and the humanities. He has published many articles on the role of science in contemporary culture in journals in France, Romania, Italy, United Kingdom, Brazil, Argentina, Japan and in the USA.

Introduction

There seems to me to be a natural harmony between transdisciplinary and integral approaches to, well, just about everything! Integral Review embraces work in transdisciplinary, developmental and integral approaches in its pages. What more appropriate than an interview with the man, more than any other I know, who has fostered an international transdisciplinary approach from his distinguished position as a leading contributor to theoretical physics.

CIRET (Le Centre International de Recherches et Études Transdisciplinaires) *http://nicol.club.fr/ciret/index.htm (from their website) "is a non-profit organization, located in Paris and founded in 1987. The aim of our organization is to develop research in a new scientific and cultural approach - the transdisciplinarity - whose aim is to lay bare the nature and characteristics of the flow of information circulating between the various branches of knowledge. The CIRET is a privileged meeting-place for specialists from the different sciences and for those from other domains of activity, especially educators."*

One can find a wealth of links to transdisciplinary publications, many of them related to the interface of science and human systems, including public policy, health, sustainability and ecology. Of particular interest is Basarab's publication, Manifesto of Transdisciplinarity *(tr. Karen-Claire Voss. Albany, NY, USA: State University of New York Press, 2002). The* Charter of Transdisciplinarity *can be found at the end of this interview. Translations of excerpts of the*

SOME RIGHTS RESERVED

manifesto, itself, into several languages can be found on the CIRET website. In addition, two papers, Gödelian Aspects of Nature and Knowledge (Translated from French by Karen-Claire Voss ; published in *Systems : New Paradigms for the Human Sciences , edited by G. Altmann and W. Koch, de Gruyter Verlag, Berlin-New York, 1998, pp. 385-403), http://nicol.club.fr/ciret/bulletin/b12/b12c3.htm#note, and The Transdisciplinary Evolution of the University Condition for Sustainable Development, http://nicol.club.fr/ciret/bulletin/b12/b12c8.htm#note were particularly useful in preparing for this interview.*

I recognize that what we covered in this conversation does little more than open the door to the subject of transdisciplinarity and its application in a wide range of human activity. I hope, one day, to have the opportunity to do a follow-up of this interview and to continue the conversation with this most gracious man who has made such significant contributions to us all.

***Russ**: Your background is in a discipline, in Physics.*

Basarab: Yes. I am a practitioner of theoretical physics, elementary particle physics. I have been doing that since 1965, when I finished my university studies, and I am still active.

Q: You hold positions in both Paris and Romania, is that correct?

A: That's right. In Paris I am at the National Center for Scientific Research, the laboratory is based at the University of Paris 6 "Pierre and Marie Curie," and I am also professor at the Babes-Bolyai University, in Cluj, which is in Transilvania. It's one of the best universities in Romania and Central Europe.

Q: Could you explain how you went from working in quantum theory and subatomic particle physics to transdisciplinarity?

A: The transition was very natural in that I was always fascinated by understanding things—not only learning, producing and, reproducing, but understanding. What I mean by understand is to connect knowledge and being. I discovered slowly that the questions that I had as a quantum physicist were shared by the big founders of quantum physics, like Werner Heisenberg, Wolfgang Pauli and Niels Bohr. These are the three names that had the biggest influence on me. I discovered that for them metaphysics and physics went together, to my surprise.

In my time, in our modern time, things are very different. The splitting of perspectives is very big. These people, like others who were the founders, were extremely cultivated people in philosophy, literature, art, poetry. They even had serious knowledge in philosophy. I was glad to slowly discover in 1975-1976, when I was in Berkeley as a post-doc, they had already discussed the question that had obsessed me.

Niels Bohr had his own program, besides physics, to explain the principle of complementarity in physics and in many other fields like psychology, politics and social life. He spent a lot of time giving talks and writing on this subject. Wolfgang Pauli was a very different person, but also extremely connected with metaphysics. He was very knowledgeable in alchemy and had very serious interactions with Carl Gustav Jung. In fact, Pauli was a patient of Jung when he was young and they began a collaboration and a friendship.

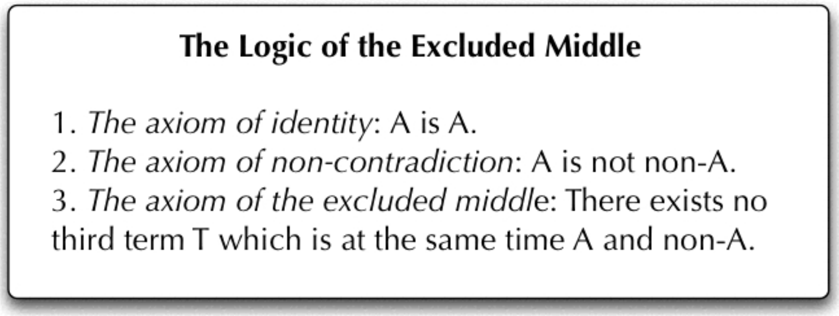
However, the person who most influenced me is Werner Heisenberg. I very much appreciate his writing, *Philosophy: The Manuscript of 1942,* which was published only forty years later in German. To my knowledge, there is no translation in English, but a very good translation in French. I discovered that a lot of things I did myself in transdisciplinarity, like levels of reality, he had already thought about and elaborated with very transdisciplinary notions.

Kurt Godel is also an incredible figure, not only for his theorems of incompleteness, which I was extremely interested in—I read them, and even understood and worked on them—but also for his many other writings and for his less-known side as metaphysician, especially in his correspondence. I am studying the letters which he addressed to his mother in which he developed original thinking about death, meaning of life, about Trinity and about God. He had even a theorem on God's existence, a serious, mathematical theorem which is less known, of course, than the other theorems.

But I was also influenced by philosophers in my way from quantum physics to transdisciplinarity. One of the people that influenced me was Jacob Boehme, about whom I wrote a book entitled, *Science, Meaning and Evolution: The Cosmology of Jacob Boehme.* He was a contemporary of Galileo Galilei's. I wrote this book and it was published in New York with an English translation. This man came from a different stance than Galileo. Galileo was the mark of break between the thinking of the Middle Age and the Renaissance. He was one of the founders, if not *the* founder, of modern physics. But he took the way of splitting culture and science, inventing the role of the universal language called mathematics.

Jacob Boehme went another way, which was not followed by scientists and which was connected with religion. He was a religious man, a Protestant from Bavaria, and he is considered the first German philosopher. Hegel considered him as being his master. He did a lot of extraordinary, interesting and original thinking about complexity in our modern world—about complexity, but connected with our internal life and life of mind and spirit and the external world. He elaborated on a kind of formalism, as form and structure, to discuss the most complicated things we can imagine.

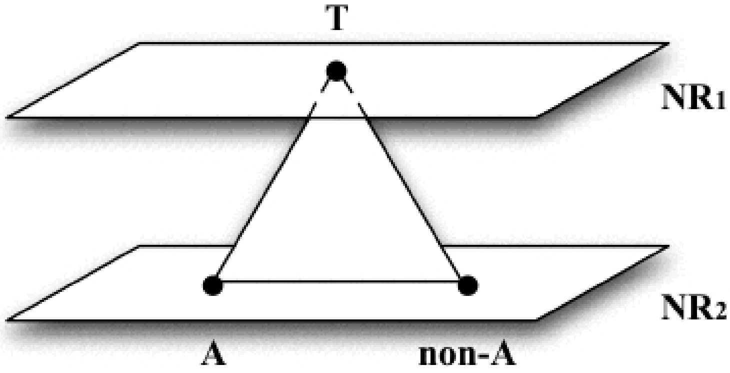
Another person is a contemporary—Stephan Lupasco—who is of Romanian origin but lived in France. He left Romania very early at the age of 16 and became one of the most interesting French philosophers. I became interested in him when I came from Romania, because he had the strange idea of renewing philosophy through quantum physics. Even Bohr, Heisenberg and Pauli didn't go so far as to transform philosophy, not in terms of physics, but based upon ideas, general ideas, which came from the physics of the 20th century and, in particular, quantum physics. Lupasco took most seriously into account paradoxical features of quantum physics concerning reality and he was a great inventor because he proposed a new logic, called the logic of the included middle.



The Logic of the Excluded Middle

1. *The axiom of identity*: A is A.
2. *The axiom of non-contradiction*: A is not non-A.
3. *The axiom of the excluded middle*: There exists no third term T which is at the same time A and non-A.

The Included Middle



The logic of the **included middle** is capable of describing the coherence among these levels of Reality by an iterative process defined by the following stages: (1) A pair of contradictories (A_0 , non-A_0) situated at a certain level NR_0 of Reality is unified by a T_1-state situated at a contiguous level NR_1 of Reality; (2) In turn, this T_1-state is linked to a couple of contradictories (A_1, non-A_1), situated at its own level; (3) The pair of contradictories (A_1, non-A_1) is, in its turn, unified by a T_2-state situated at a third level NR_2 of Reality, immediately contiguous to the level NR_1 where the ternary (A_1, non-A_1, T_1) is found. The iterative process continues to indefinitely until all the levels of Reality, known or conceivable, are exhausted.

In other words, the action of the logic of the **included middle** on the different levels of Reality induces an open structure of the unity of levels of Reality. This structure has considerable consequences for the theory of knowledge because it implies the impossibility of a self-enclosed complete theory. Knowledge is forever *open*.

- Basarab Nicolescu

Q: *That is a very rich history that you have placed before us. Would you contrast transdisciplinarity with the disciplinary, multidisciplinary and interdisciplinary approaches?*

A: Yes. This is very important to clarify from the beginning because these are words, which, even now—many years after transdisciplinarity was introduced—are confused.

In very schematic words, what is it all about?

The starting point is the incredible multiplication of the number of specialized disciplines with time. When the very first universities were founded around the 13th century, we had seven disciplines, which were called *trivium* and *quadrivium*, corresponding more or less to what we call today Exact Sciences and Human Sciences. In 1950, we already had 54 disciplines. It began increasing very fast. In the year 2000 we had more than 8,000 disciplines. These numbers are coming from a very serious poll made by the National Science Foundation. Many of these are taught in American universities. 8,000 disciplines means 8,000 ways to look for reality. It means a catastrophe for knowledge in some sense, because it means there is no more unity of knowledge. Because of that, after 1950, words like multidisciplinarity and interdisciplinarity were very current as a need to reunify and reconnect in the present situation.

In fact, multidisciplinarity was always there, from the founding of universities. What means multidisciplinary? It means I take an object from a given discipline, say a painting by Giotto. I can study it as an object of the history of art; I can study it from the point of view from the history of Europe, from psychoanalysis, chemistry or physics and so on. Throughout my investigation, I am returning to the initial discipline, which is the history of art in our example. Multi-disciplinarity is studying an object from a given discipline with ideas you have from other disciplines, but it remains in a disciplinary context.

Interdisciplinary is completely different. The word became fashionable around 1950. Especially in the U.S. there was a huge development of interdisciplinary thought even inside universities. We have interdisciplinary departments now. The idea was the transfer of methods from one discipline to another. Let me give you a famous example. You study very different phenomena, like how clouds develop and the evolution of stock market actions. You transfer, in this study, methods from mathematical physics and you get a new discipline called Chaos Theory. It is how Chaos Theory appeared—from the transfer of ideas from mathematical physics to the study of meteorology and of stock market actions.

We have here the transfer of methods, but we have also the disciplinary way of dealing with this new kind of knowledge we acquire. Interdisciplinarity still situates in the frame of disciplinarity. More than that, one can give birth to new disciplines, like quantum cosmology. There are many other examples. It's disciplinarity, but extended disciplinarity.

Transdisciplinarity is radically different. It doesn't mean that it's better or hierarchically higher; I don't make hierarchies. I'm speaking about distinctions. Transdisciplinarity is completely different in the sense that it puts the problem of the information that circulates in between disciplines, across disciplines, and even beyond any discipline. The sketch I'm giving is not really a definition, it's just the etymology of the word. “Trans” is a Latin word meaning at the same time, in between, across, and beyond.

If you don’t have the meaning “beyond disciplines”, then transdisciplinarity is no more than a variant of interdisciplinary, due to the fluctuation of disciplinary frontiers. But because it is *beyond* any disciplines, transdisciplinarity is radically different from all the others.

It’s no mystery. What is beyond any discipline? It is, of course, ourselves, the human being. In more sophisticated words, we can say that what is beyond is the Subject. The Subject cannot be captured through formalism. When you want to capture it, it’s an ontological catastrophe, because the Subject is transformed in Object. Transdisciplinarity is coming back to knowledge of the Subject, more precisely of the interaction between the Subject and the Object.

The word “transdisciplinarity” itself is relatively new. The philosopher and psychologist Jean Piaget, who is Swiss, invented this word in 1970 at the Organization for Economic Cooperation and Development (OECD) Congress in Nice, France. The subject of the Congress was methods of teaching in universities. Piaget was very familiar with the psychology of children. It is very important that this started with observing the needs of the children. Piaget talked about fluctuation of disciplinary frontiers and he guessed that from this fluctuation of boundaries, new kind of knowledge is generated. He introduced the name transdisciplinarity for that. From the time when Piaget introduced the word, thinkers like Erich Jantsch, Edgar Morin, Ludwig von Bertalanffy also became interested. Transdisciplinarity was, however, in a kind of sleep for many years, because nobody really succeeded in capturing what this was really about—*beyond the disciplines*.

Here I came, with all my modesty, in 1985 when I published my first book in France. I had published another book in Romania before leaving in 1968. In France, I published a book called *Nous, la Particule et le Monde*. It is a book about quantum physics and the epistemological and philosophical implications of quantum physics, about the thinking of the founders about what reality means. What motivated me the most was that I was puzzled by the fact that the two big intellectual constructions of the 20th century, which are the theory of relativity and quantum mechanics, could not be joined together, could not be reconciled.

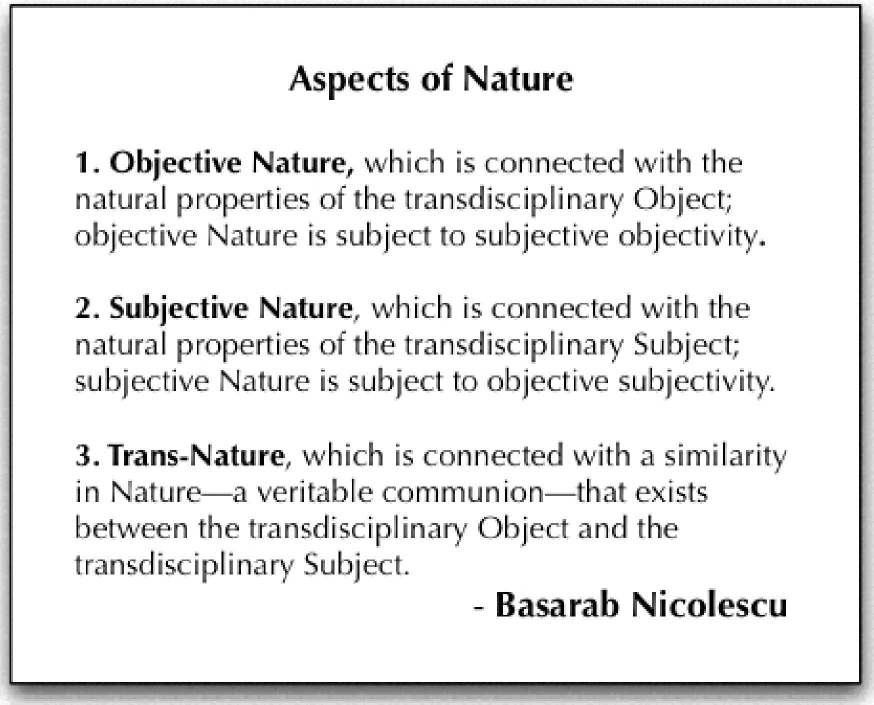
The situation is the same today. It was kind of rupture, a discontinuity. So I tried to understand that. In this framework, I must say that a very big role in my evolution of thinking was my stay at the Lawrence-Berkeley Laboratory, where I spent one year working with Geoffrey Chew, the founder of the Bootstrap Theory. We even produced papers together and we had lots of meetings about the philosophy of physics.

At that moment, Fritjof Capra was there in Berkeley, and he wrote the bestseller, *The Tao of Physics*. I did not agree with the content of this book. I thought *The Tao of Physics* was a very useful book, because for the first time the problem of philosophical and metaphysical implications of quantum physics were shared with the public. But I did not agree, because Capra replaced all the content of quantum physics, in a kind of analogical game, within the philosophy from the East: Chinese, Buddhist, Taoist.

I knew from my own practice with physics and my knowledge of philosophy that, in fact, modern science appeared here in Europe. Galileo Galilei, Newton and Kepler were from Europe. Why from Europe was the big question, which Joseph Needham, the philosopher of science, tried to answer. Why didn't modern science appear in China where they have fabulous thinking and fabulous science?

My idea, and this is why I wrote the book on Jacob Boehme, was in fact that the Christian way of thinking, with making distinctions and with the idea that this world is here for us to take advantage of and to dominate, was the background of modern science. Europeans were able to think about nature, a fact that China refused to do. China refused to cut things, to cut slices of reality. European thinking, founded on Christian religion, adopted the method of slicing reality. We saw emerging the idea that by slicing reality with mathematical methods we will generate the process of understanding all reality. I discovered later that Hans-Georg Gadamer had the same view on the European origin of modern science.

That is why I was in disagreement with Capra, but the disagreement was productive, because we had a lot of discussions with Chew and with many others there and this stimulated me a lot. It was in Berkeley, in fact, that I had the idea that initiated the new way of transdisciplinarity in 1985—the idea of levels of reality. This is a little bit of background.



Aspects of Nature

1. Objective Nature, which is connected with the natural properties of the transdisciplinary Object; objective Nature is subject to subjective objectivity.

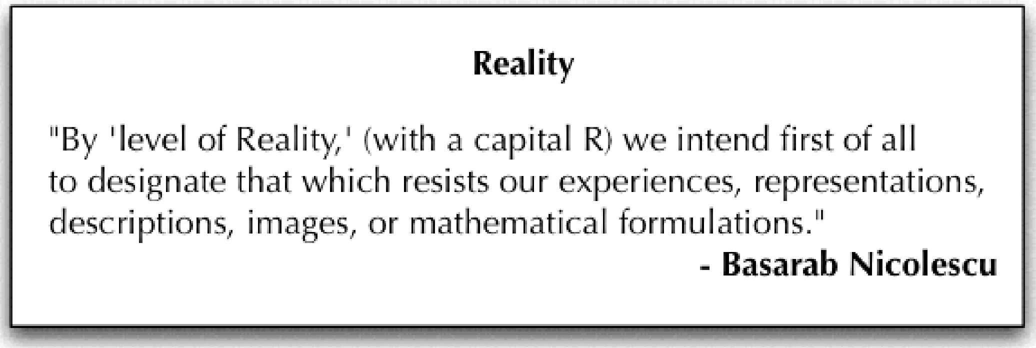
2. Subjective Nature, which is connected with the natural properties of the transdisciplinary Subject; subjective Nature is subject to objective subjectivity.

3. Trans-Nature, which is connected with a similarity in Nature—a veritable communion—that exists between the transdisciplinary Object and the transdisciplinary Subject.

- Basarab Nicolescu

Q: *In what way would you say transdisciplinarity is a metatheory and in what way would you say it's more an attitude, a vision, and a practice?*

A: It's very difficult to say that transdisciplinarity is one thing or another before giving its definition. Transdisciplinarity took long years to formulate, but the methodology of transdisciplinarity was already present in my book I just quoted, *Us, the Particle and the World,* which is not yet translated in English. In this book, I identified three axioms, which are now considered by many researchers around the world as defining transdisciplinarity.



Reality

"By 'level of Reality,' (with a capital R) we intend first of all to designate that which resists our experiences, representations, descriptions, images, or mathematical formulations."

- Basarab Nicolescu

The first axiom is the *existence of levels of reality*. We have to define what levels of reality means. Let’s say, in first approximation, that the laws of quantum physics correspond to a new level of reality in total discontinuity with the laws of nature we knew at the level of our own scale, where Newtonian physics is valid. Newtonian, or classical, physics is applied essentially at our scale of centimeters, seconds, and so on, with extension to planets and cosmic things, towards the infinitely long and infinitely big, like we say.

Quantum physics goes the other direction: infinitely small and infinitely short—extremely small distances and extremely short intervals of time. And there, to our surprise, we discovered laws that cannot reduce to classical physics. That’s the core of all understanding of this revolution. It is the fact that one cannot reduce the quantum laws to the classical laws. We cannot have continuous passage from one to the other. That’s the reason why, in fact, quantum physics and the relativity theory are, in logical terms, a contradiction. It doesn’t mean they contradict facts—they are all perfect for their realm of reality. But it’s a very defined realm— and that’s the point.

In a given region of reality, classical physics is perfect. But if you extend this region, classical physics is working no more, and you discover new laws, which are in discontinuity with the laws of our own scale. That’s more or less how I define levels of reality. If you have levels of reality outside, in the world, in the Object, like philosophers say, we have to have levels of reality in the observer, in who observes this reality. Otherwise, the observer will not understand reality. For example, suppose you are a lover of poetry, and you love a French poet like Lamartine, a classical poet. Anyone can understand his poems. If you want to understand the poems by Mallarme, for example, a big hermetical poet, it’s very difficult. You have to have something like new sense organs inside of you to understand that. It’s exactly the same with quantum and classical physics.

There are levels in ourselves, in our own understanding, representation, languages and so on, and even levels of reality of the Subject. I must add here to the names which influenced me, the name of the big German philosopher, Edmund Husserl. He elaborated the transcendental phenomenology, which is an important way of approaching reality and philosophy. Husserl was a mathematician, which is why I was attracted to him. He was the master of Heidegger. Husserl didn’t call them levels of reality, but he spoke about these different levels in us, in the Subject.

So, I presented to you till now the first axiom, the ontological axiom of transdisciplinarity. “Ontological” in the sense that it’s an axiom about being. Being of the world, and being of ourselves, of the observer, and of the Object—being of the Subject, being of the Object and being of reality. Now, in order to go from one level of reality to another, it's absolutely clear that our usual logic—classical logic, which was invented by Aristotle and which identified the rules of understanding, of our propositions, of our assertions, of our language—would not work. It's very clear that if you judge reality in terms of "yes" and "no", "yes" is right and "no" is wrong. This logic is not valid in quantum physics. That's one of the big surprises.

The usual logic is not compatible with what we see in nature, in the sense that in quantum physics there is a basic feature, which is called the Principle of Superposition. That means that if you have a physical state, which is compatible with physical laws, and you have another state, which is also compatible, you take a combination of the two and this is also compatible. This is expressed by the famous paradox of Schrödinger's cat. In quantum physics, you have a cat that is dead and alive at the same time. You put it in a cage, you put poison nearby, and if the cat is hungry, it will eat the food with poison and will die. If she is clever, she will not eat and will remain alive.

In our world, the cat will be alive or dead. In the quantum world, the superposition is dead and alive at the same time. The Principle of Superposition is the origin of all that is called paradoxes in quantum physics. The big founders like von Neumann and Birkhoff felt from the beginning that there was something fishy about logic and quantum reality. They tried to invent new logics—quantum logics. It was an extraordinary opportunity in the history of culture.

There are mysterious things happening in culture in the sense that in different fields of science and culture, the same basic ideas appear in forms that are very different. For example, Planck discovered quantum physics in December 1900. In the same year, abstract art was founded by Hans Arp. This coincidence is about translating this discovery of reality, which can have different facets in different fields. I say that because logics were believed to be universal, inherent, in some sense, to our own mind, to our neurons. Natural. Nobody thought of other kinds of logics than classical logic. It happened that at the beginning of the 20th century, a great number of non-classical logics began to be formulated—formal logics, axiomatic logics. And Gödel came with his famous theorems. I say that because quantum logic is a basic axiom in transdisciplinarity, namely the included middle logic, which is one variant of this non-classical logic.

What does it mean in simple words without going into technical details? For a normal mind, you cannot say yes and no at the same time, or there is something strange with your way of thinking. But you can have yes and no at the same time if you have at least two different levels of reality. That's a basic fact that I demonstrated in 1985 in the book *Nous, la Particule et le Monde*, and it was a simple solution to all these puzzles of paradoxes. If we are located on a given level with our mind, our representations, our images, we will discover in our formalizations, located on a different level of reality, as a couple of oppositions, yes and no. On our own level, our representations appear as approximations, as sections or projections of something much richer, which are submitted to more general laws. This is the second axiom of transdisciplinarity: In order to go to complex phenomena, you need a non-classical logic, and the best candidate is this included middle logic.

The third axiom of transdisciplinarity is the axiom of complexity. There are many theories of complexity. I noted myself at the Congress in 1992 at the Pontifical Academy of Science, consecrated to complexity in sciences, that no less than 32 different definitions of complexity were given. Most of these variants are not compatible with the existing levels of reality. One of the compatible variants is the one of Edgar Morin. This is in connection with general systems theory, a systemic approach.

From the point of view of transdisciplinarity what we need is complexity, understood as the fact that every level of reality is what it is because it's connected with all the other levels of reality. Reality has a complex structure. Complexity, in this form, is no more or no less than the very old Principle of Universal Interdependence.

If you take these three axioms, which parallel the three axioms of modern science, you get the definition of transdisciplinarity. But this means that we define transdisciplinarity not via a new discipline, but via a new methodology. In other words, we identify transdisciplinarity not with a new discipline, but with a new knowledge—knowledge about what is in between, across and beyond disciplines. For this new knowledge, you need these three axioms—perhaps you need more. I don't know but, for the moment, we need only three. The first time I formulated these three axioms was in 1985 in my book *Nous, la Particule et le Monde*, ten years before the *Manifesto of Transdisciplinarity*.

If you take the three axioms, for the first time you can understand these realms of reality which involves the Subject and involves all of the different aspects of us. This means the individual level and also the social level. We talk about knowledge, which is not neutral. Disciplinary and academic knowledge is by definition neutral, with no values. You are not allowed to introduce values into scientific knowledge. However, transdisciplinarity is not neutral, and involves values, namely humanistic values, which are generated by the interaction of these three axioms.

Q: *You use a definition of reality that includes the concept of resistance. Can you clarify that?*

A: I apply what every scientist applies. In our scientific world, we know that there is something which resists. It doesn't matter what we call it, whether it's nature or laws of nature—there is something inside and outside of us that resists our sense organs. That's how science began: just touching things, looking around and so on. After that, the human being invented the extension of sense organs through instruments of measure. He was thus able to explore the frontiers of nature and reality.

There is a resistance in the sense that in science, for example, we discover new things all the time. From where do we discover? It is not from our mind. It is not from our will. It is because something resists there, outside of our instruments and our sense organs. But it is more than that. There is resistance connected with representations. If I take a tennis ball and say it is a square, this means that I might have slight problems with my mind and I will have to consult a psychiatrist! I must agree that the ball is a sphere. It is true that the ball is a sphere comes from the agreement of the community, but the agreement is connected with the resistance of the fact that every time I have a tennis ball, it is a sphere, not a square.

So there is resistance to images, descriptions and even mathematical formalizations. For example, in more than 40 years of practicing quantum physics, I saw a lot of beautiful theories that disappeared. Why? They were beautiful on a mathematical level, but they were in contradiction with basic facts. It takes only one basic fact to destroy the most beautiful theories—why? Because there was resistance, even in mathematical formalizations. So resistance is a kind of bread we eat every day. Without resistance, we wouldn't discover things. Nature looks like an infinite reservoir of resistance. Is this clear?

Q: *Yes, it is. If there weren't some kind of resistance, we wouldn't even notice it.*

A: Yes. It is important also to distinguish two facts before finishing with the problem of resistance. There is one aspect that is connected with an agreement in a human community. That's the pragmatic part of this resistance. There is also an ontological side that I want to underline, a transpersonal aspect of reality. Even if we agree on something, a small thing appears which destroys our agreement. So, it is transpersonal trans-agreement, beyond agreement. It is not true what some philosophers belonging to some extremely relativist currents are saying that all is a social construction. Some philosophers say that even science is a social construction. Yes, it's a social construction, but not just that. And we capture in transdisciplinarity that this nature, this reality, is the outcome of a kind of agreement inside a community, but it's not only that. We capture also the action of the third, of the interaction term between the Subject and Object.

Q: *Will you clarify the concept of the third?*

A: I prefer to call it the hidden third. Why hidden?

Our modernity—what we call modernity in academic terms—appeared via a split between the Subject and Object. We say there is an Object, there is a Subject that observes it, and in between there is nothing else. That's the basis of what we call classic reality.

I ask you, "What is the object of transdisciplinarity?" and I say that this question has no meaning in the framework in which the knowledge is not about an object, but it's about the interaction between the Subject and the Object. Subject comes back. At the beginning of our interview, I said the Subject comes back via this interaction term between the Subject and the Object, which mediates the interaction between the Subject and the Object. But it's a zone of reality in which there are no levels. No resistance. It's a non-resistant region in reality which is there. We don't know much about it. We know it's rational because we say it is there, but if we want to say what it is, we don't know. We cannot make theories about this third; we cannot make models about it. We know it must be there.

I told you about my fascination with Heisenberg. Many years after I had these ideas and put them in print, I discovered that he had had similar ideas. Originality is not necessarily important. It's nice when you have confluence with other thinkers. In quantum physics, we observe this strange thing: when a given object comes into observation, the rules change, laws change. Why? Because the Subject, by definition, means interaction of our natural scale with a scale which is not at all natural—not in the visible nature. It's in nature, but much deeper. But this confrontation doesn't mean that the subject modifies reality. It is not that. It's that the subject, by its very presence, puts different scales into confrontation. This hidden third is there to mediate. This is the new aspect of what we can call transmodernity. This means we have this third, which means three components of reality: Subject, Object and the interaction term. There are philosophers who taught in this way, like Husserl, Cassirer, Heidegger, Gadamer. They have these ideas of a different kind of metaphysics than the classical metaphysics. So, transdisciplinarity is a new form of knowledge, which is not in contradiction with other realms of knowledge, but it takes on general features from different realms of reality and that is all.

Q: If we're talking about Subject, Object and a mediating factor, the mediating factor is a realm of knowledge that has been neglected historically but which has rich potential in terms of shifting from a material level of analysis to one that is far more dynamic and process-oriented. Is that the case?

A: Absolutely. That's one side of the story. It's not just environment, which mediates the processes. Non-resistance means that it's something rational but cannot be rationalized. I'm speaking sometimes about the sacred, the sacred as being connected with this hidden third. It is not in a religious sense, but in a philosophical sense: rational, but we can't rationalize it. This means sacred is something there, which is irreducible to my thinking, to my theory and my dogmas. It's the basis of respect I have for the other. It's the basis of tolerance and non-dogmatism and love I can have for the other, not just accepting the other as being there. I know that love is an irreducible part of the sacred, using the terminology introduced by Mircea Eliade, the founder of modern history of religions who lived in the United States. This third completes the picture we have as transdisciplinary reality, and is materializing given concrete terms like process theory and many other things. But it's also something beyond any theory.

Returning to your previous question I am saying now that *transdisciplinarity is not a metatheory. It's not a theory at all. It's both science and art. In fact, it is neither science nor art. It's a new knowledge you cannot reduce to old knowledge.* [Emphasis added—RV]

There is an interesting parallel with the methodology and definition of modern science. Modern science, as defined by Galilei and other founders, is the posit of three axioms. The axioms include mathematical universal laws, which are formulated in a non-natural language, which is mathematics. Second, you can discover these axioms through experiment. When we say experiment, we mean given rules for repetition of the same experiment with the same conditions. Third, there is reproducibility. In other words, we have to be able to get exactly the same results if we have the same condition of experiments because we have the same laws.

These three axioms were revolutionary when they were formulated three centuries ago. But they don't exhaust the realm of reality. That's the point with transdisciplinarity. It is a larger field that includes the Subject, which includes subjectivity. We clearly put on the table the value of subjectivity, of feelings, of intelligence in feelings. When I began to speak about things like that about 20 years ago, people were slightly laughing, because I was a physicist speaking about this. Now, scientists like Antonio Damasio, the neurophysiologist, began to discover that feelings and the human body have cognitive value. Transdisciplinarity is about a new type of intelligence, which connects the analytic mind with the feelings and the body. It is connected with personal experience, but not any kind of experience, because the experience in general is chaotic. *In vivo* reality, which is about transdisciplinarity, is not chaotic reality. It's a reality that still has laws and rules and is obeying the axioms I was talking about.

Q: *Is this what has led to the new principle of relativity that you write about?*

A: The new principle of relativity has to do with the fact that every level of reality of the Subject and of the Object, is what it is because all the other levels exist at the same time. What this means is there is coherence. You see reality in the transdisciplinary approach, and reality is not schizophrenic. It's not putting together different levels, but connecting them. This is based on scientific knowledge, because in pure science. We saw incredible coherence between the universe and the infinitely small, the quantum world. It's how quantum cosmology appeared.

Big Bang is a theory uniting the infinitely small with the infinitely long. Because at the beginning, our universe was a small, small thing in which only quantum processes were there. This means that clearly there is a relation, a link between the infinitely small with the infinitely long. This means that if you cut a level by itself, you lose information. In order to keep all information together, the identity of a level of reality is connected with the identity of all other levels and that has great implications. Many other people have extended these considerations, not only to disciplines, but also to cultures and religions. This principle of relativity asserts that every culture is what it is because all the other cultures are there at the same time. Every religion is what it is because all of the other relations are there at the same time. It doesn't mean we're looking for a new religion or new culture—that would be nonsense.

When we speak about transreligion and transculture—these are the two key words in transdisciplinarity, in this field of the principle of relativity—we don't speak about unity in the sense of dogmatic unity. Each religion has to have dogmas in order to speak in a clear way. In culture, you have to have a set of rules to identify American culture, European culture, the various types of cultures. When we speak about transculture, we don't mean one culture all over the world. We say there is unity of cultures, but in a transcendental way. This is similar to what Rene Thom calls a strange attractor. It is like a strange attractor in the sense you have an asymptotic point that is there, but you cannot put your hands on it. If it's very carefully done, we avoid the wrong turns of transdisciplinarity.

Q: *So this new principle of relativity honors all the levels?*

A: Right.

Q: *What is the role of David Bohm's work on implicate and explicate order? How does that relate to transdisciplinarity?*

A: I knew Bohm and I had interactions with him. I met him in California and also in London. There are some connections. His implicate order has to do with the hidden third. It's not identical, but it's connected.

Q: *What about Lazlo's work with the Akashic field?*

A: I know Erwin and I respect his work, but I don't see the connection.

Q: *Why is that?*

A: I don't know. I think that he doesn't take this notion of levels of reality seriously enough.

Q: *Are you familiar with the work of the American philosopher Ken Wilber?*

A: Yes. I've been told I need to meet him, but the opportunity has not come about. Many people say that there are big connections, but I must confess I don't have a lot of knowledge about his work. I was glad to see that the famous art critic Suzi Gablik connected the two theories in her famous book *Has Modernism Failed*. The last chapter is about transdisciplinarity and she connects it with integral theory. I was surprised that she is familiar with transdisciplinarity. She considers it the only new thing that has happened in philosophy and knowledge in this last period. I was impressed, not just because she says such nice things about transdisciplinarity, but it was from deeply inside and genuine and there she connects transdisciplinarity with the theory of Ken Wilber.

Q: *One of the ways that I see a connection is with Wilber's notion of integral methodological pluralism, and it would seem to me that in the transdisciplinary approach, what we're talking about is a methodological pluralism in whatever it is we're approaching.*

A: I have to study his concrete definitions, but based on what you just said, there is a pluralism within transdisciplinarity via the very existence of different levels. The different levels are like different viewpoints you can take on reality, but they're all connected. If you just stay on a level or point of view, you are losing information. It is a strange pluralism in transdisciplinarity, like an oxymoron—unity in pluralism.

Q: *I love it!*

A: It is like the old Hebraic words for God, Elochim. My friend André Chouraqui told me that it is singular and plural at the same time. I think that is what we need. We need a different kind of universal language, in which we have to understand that single and plural go together. The whole point about transdisciplinarity is to take them together.

Q: *Given the ideas of transdisciplinarity have been around 20 years or more, have you seen any significant progress or accomplishments emerge from this approach?*

A: Of course—and fortunately, because otherwise it would mean I invested for nothing. If there is no concrete thing, there is no value, my theories were useless. There are different concrete fields. One field in which there is already a lot is education. I worked many years with UNESCO on a project of applying transdisciplinarity in higher education. We met in a Congress in Locarno in 1997, sponsored by UNESCO. That was the turning point toward practical applications in education. This means renewed methods of teaching in different fields, and introducing transdisciplinarity in universities. I'm proud to say that I succeeded, myself, after many years of fighting in many countries, I now have two possibilities—one in South Africa and one in Romania—to start Ph.D.s in transdisciplinarity. There are many people in the world who are at the intersection of different fields of knowledge and they have no way to do their Ph.D. studies, because there is no department in the world. So all the work I did with many, many friends all over the world was to create these conditions. Slowly they are appearing through applications made by individual professors. They are appearing. You can see it in the last issue (in French) of "Transdisciplinary Encounters," the magazine published by the organization I'm leading, CIRET, on the concrete application in education. In South Africa, they are on the way to do that at Stellenbosch University. There are many places in which there are transdisciplinary lectures; in the U.S., in Romania, in Italy and even in France. Myself I am teaching transdisciplinarity at the Babes-Bolyai University from Cluj-Napoca, in Romania, for doctoral students.

Another field in which I'm very happy to see that it's moving towards transdisciplinarity is the realm of health. There is one important organization in Quebec, led by one of our members, Patrick Loisel, who even founded a transdisciplinary department for health sponsored by the Canadian Institute of Health. It's financed by government and at the University of Sherbrooke, in which he brought together people from different specialties for handicap problems. They are applying transdisciplinarity ideas and *methodology* with the levels of reality, but in concrete terms and in context. They've convinced people that everybody wins with this connection.

The other ways in which transdisciplinarity is applied is in a powerful country of transdisciplinarity, Brazil. The formation of transdisciplinarity among university people, but also different social workers, has been at the University of Sao Paulo for three or four years. In fact, in Brazil, in September 2005, we had the second World Congress of Transdisciplinarity, and to my surprise I saw that more than 50 universities were represented from Brazil. They were not only teaching transdisciplinarity, but using it in organizations of departments and curriculum.

Another way is the problem of law studies. They are especially interested to include the problem of the included middle in the problem of law. This is an important problem.

Q: *So how can other people get involved?*

A: Unfortunately the university is still reluctant, so you get involved through people, through different groups and organizations—NGOs. CIRET is one of them. We have a rich data bank, we give information on the events, we publish research and studies, so we connect with people working on that. My ambition for the next several years is to see that entering into institutions, because institutions need that. Otherwise, universities will disappear. If a university doesn't adopt transdisciplinarity, in my opinion, universities, as we know them from the 13th century, will disappear and be replaced by highly specialized institutions.

Q: *Thank you. You have given us a lot to think about and some challenges to engage with.*

A: I thank you very much because your questions were extremely stimulating.

CHARTER OF TRANSDISCIPLINARITY

Preamble

Whereas, the present proliferation of academic and non-academic disciplines is leading to an exponential increase of knowledge which makes a global view of the human being impossible;

Whereas, only a form of intelligence capable of grasping the cosmic dimension of the present conflicts is able to confront the complexity of our world and the present challenge of the spiritual and material self-destruction of the human species;

Whereas, life on earth is seriously threatened by the triumph of a techno-science that obeys only the terrible logic of productivity for productivity's sake;

Whereas, the present rupture between increasingly quantitative knowledge and increasingly impoverished inner identity is leading to the rise of a new brand of obscurantism with incalculable social and personal consequences;

Whereas, an historically unprecedented growth of knowledge is increasing the inequality between those who have and those who do not, thus engendering increasing inequality within and between the different nations of our planet;

Whereas, at the same time, hope is the counterpart of all the afore-mentioned challenges, a hope that this extraordinary development of knowledge could eventually lead to an evolution not unlike the development of primates into human beings;

Therefore, in consideration of all the above, the participants of the First World Congress of Transdisciplinarity (Convento da Arrábida, Portugal, November 2-7, 1994) have adopted the present Charter, which comprises the fundamental principles of the community of transdisciplinary researchers, and constitutes a personal moral commitment, without any legal or institutional constraint, on the part of everyone who signs this *Charter*.

Article 1:

Any attempt to reduce the human being by formally defining what a human being is and subjecting the human being to reductive analyses within a framework of formal structures, no matter what they are, is incompatible with the transdisciplinary vision.

Article 2:

The recognition of the existence of different levels of reality governed by different types of logic is inherent in the transdisciplinary attitude. Any attempt to reduce reality to a single level governed by a single form of logic does not lie within the scope of transdisciplinarity.

Article 3:

Transdisciplinarity complements disciplinary approaches. It occasions the emergence of new data and new interactions from out of the encounter between disciplines. It offers us a new vision of nature and reality. Transdisciplinarity does not strive for mastery of several disciplines but aims to open all disciplines to that which they share and to that which lies beyond them.

Article 4:

The keystone of transdisciplinarity is the semantic and practical unification of the meanings that traverse and lay beyond different disciplines. It presupposes an open-minded rationality by re-examining the concepts of "definition" and "objectivity." An excess of formalism, rigidity of definitions and a claim to total objectivity, entailing the exclusion of the subject, can only have a life-negating effect.

Article 5:

The transdisciplinary vision is resolutely open insofar as it goes beyond the field of the exact sciences and demands their dialogue and their reconciliation with the humanities and the social sciences, as well as with art, literature, poetry and spiritual experience.

Article 6:

In comparison with interdisciplinarity and multidisciplinarity, transdisciplinarity is multireferential and multidimensional. While taking account of the various approaches to time and history, transdisciplinarity does not exclude a transhistorical horizon.

Article 7:

Transdisciplinarity constitutes neither a new religion, nor a new philosophy, nor a new metaphysics, nor a science of sciences.

Article 8:

The dignity of the human being is of both planetary and cosmic dimensions. The appearance of human beings on Earth is one of the stages in the history of the Universe. The recognition of the Earth as our home is one of the imperatives of transdisciplinarity. Every human being is entitled to a nationality, but as an inhabitant of the Earth is also a transnational being. The acknowledgement by international law of this twofold belonging, to a nation and to the Earth, is one of the goals of transdisciplinary research.

Article 9:

Transdisciplinarity leads to an open attitude towards myths and religions, and also towards those who respect them in a transdisciplinary spirit.

Article 10:

No single culture is privileged over any other culture. The transdisciplinary approach is inherently transcultural.

Article 11:

Authentic education cannot value abstraction over other forms of knowledge. It must teach contextual, concrete and global approaches. Transdisciplinary education revalues the role of intuition, imagination, sensibility and the body in the transmission of knowledge.

Article 12:

The development of a transdisciplinary economy is based on the postulate that the economy must serve the human being and not the reverse.

Article 13:

The transdisciplinary ethic rejects any attitude that refuses dialogue and discussion, regardless of whether the origin of this attitude is ideological, scientistic, religious, economic, political or philosophical. Shared knowledge should lead to a shared understanding based on an absolute respect for the collective and individual Otherness united by our common life on one and the same Earth.

Article 14:

Rigor, openness, and tolerance are the fundamental characteristics of the transdisciplinary attitude and vision. Rigor in argument, taking into account all existing data, is the best defense against possible distortions. Openness involves an acceptance of the unknown, the unexpected and the unforeseeable. Tolerance implies acknowledging the right to ideas and truths opposed to our own.

Article final:

The present Charter of Transdisciplinarity was adopted by the participants of the first World Congress of Transdisciplinarity, with no claim to any authority other than that of their own work and activity.

In accordance with procedures to be agreed upon by transdisciplinary-minded persons of all countries, this Charter is open to the signature of anyone who is interested in promoting progressive national, international and transnational measures to ensure the application of these Articles in everyday life.

Modeling the Demands of Interdisciplinarity: Toward a Framework for Evaluating Interdisciplinary Endeavors

Zachary Stein

Abstract: I suggest there are two key factors that bear on the quality of interdisciplinary endeavors: *the complexity of cognition and collaboration* and *the epistemological structure of interdisciplinary validity claims*. The former suggests a hierarchical taxonomy of forms of inquiry involving more than one discipline. Inspired by Jantsh (1972) and looking to Fischer's (1980) levels of cognitive development, I outline the following forms: disciplinary, multi-disciplinary, cross-disciplinary, inter-disciplinary, and trans-disciplinary. This hierarchical taxonomy based on *complexity* is then supplemented by an epistemological discussion concerned with *validity*. I look to a handful of philosophers to distil the general *epistemological structure of knowledge claims implicating more than one discipline*. This involves differentiating between levels-of-analysis issues and perspectival issues. When all is said and done, we end up with a "language of evaluation" applicable to interdisciplinarity endeavors. Ultimately, this suggests an ideal mode of interdisciplinary endeavoring roughly coterminous with Wilber's (2006) Integral Methodological Pluralism.

Keywords: cognitive development, epistemology, integral methodological pluralism, interdisciplinary, language of evaluation, levels-of-analysis, perspectival, transdisciplinarity

Introduction: my agenda

> *"…there are no standards of excellence for interdisciplinary work in general"* (Klein 1990, p. 94).
>
> *"A crucial consequence resulting from the shift in knowledge production from Mode 1 [disciplinary] to Mode 2 [interdisciplinary] bears upon quality control"* (Gibbons, et al., 1994. p.18).

The quotes above are taken from two of the most influential books about interdisciplinarity. They reflect a general concern about interdisciplinary endeavors. How do we detect the "symptoms of quality" in interdisciplinary work (Mansilla & Gardner, 2003)? That is, how do we understand the demands of interdisciplinary work, such that we can know when they have been met? How do we evaluate interdisciplinarity?

Such an evaluation entails more than a description of what passes as interdisciplinary work. Much of the scholarship *about* interdisciplinarity amounts to descriptions of the state of the art (Klein, 1990, 2005; Lattuca, 2001; Gibbons, et al., 1994). This work is important and informs my account. Yet, the thrust of what I have to offer is normative. Not what interdisciplinarity *is*—but

SOME RIGHTS RESERVED

what it *ought* to be. Of course, we'll have to move from *is* to *ought*, offering some descriptions before issuing some prescriptions.

My plan in this article is as follows. I will look to the descriptive accounts in order to arrive at a loose definition of the phenomenon in question. We'll see just what people think interdisciplinarity is. This will involve a brief historical overview and a discussion of three types of initiatives: interdisciplinary education, problem-focused interdisciplinarity, and synoptic interdisciplinarity.

Then we will go on look at some evaluative accounts. These discuss the demands of interdisciplinary work. The goal here is to tease out the key factors bearing upon the quality of interdisciplinary endeavors. Two factors fall out of the discussion: *the complexity of cognition and collaboration* and *the epistemological structure of interdisciplinary validity claims*.

With the first factor involving the *complexity* of the practices and concepts being employed, we see that interdisciplinarity is not an all-or-nothing thing; there are gradations of interdisciplinarity. We will differentiate four types, each more complex than the next: multi-disciplinary, cross-disciplinary, inter-disciplinary, and trans-disciplinary. Each is a valid and valuable type of engagement. But there are important differences between them, which, as we will see, make them important to distinguish for the purposes of quality control.

With the second factor we find that interdisciplinary endeavors face unique and exacting epistemological demands. In this discussion, issues of *reductionism* take center stage. Here we see that the *unwarranted privileging of certain disciplinary perspectives* is a concern. This concern motivates a more careful and explicit account of the epistemological structure of interdisciplinary knowledge claims. It turns out that there are both *levels-of-analysis issues* and *perspectival issues*, which are not to be confused.

The considerations about complexity give us a hierarchical taxonomy based on the complexity of concepts and practices. The epistemological considerations give us a horizontal taxonomy based on epistemological relations between different types of methodologies. Combining the typologies will give us a robust model concerning the demands of interdisciplinarity.

In short, we will end up with a “language of evaluation” applicable to interdisciplinarity endeavors. This language is capable of disclosing how some interdisciplinary endeavors fall short in terms of complexity and how others flirt with epistemological fallacies. This language of evaluation suggests an ideal mode of interdisciplinary endeavoring, in light of which we may judge those who claim to proceed as such. Wilber's (2006) philosophical position of *Integral Methodological Pluralism* is nearest to this ideal. However, the version I endorse is highly formalized and thus stripped of many Wilber-specific accoutrements.

But first things first: what are we talking about?

On definitional deficits

> *"That's a great deal to make one word mean," Alice said in a thoughtful tone. "When I make a word do a lot of work like that," said Humpty Dumpty, "I always pay it extra."*
> Lewis Carol, *Alice in Wonder Land*. (Quoted in Klein, 1990)

All top American universities boast some species of interdisciplinarity. Most offer interdisciplinary majors of some sort. Some have interdisciplinarity as an aspect of their mission. Interdisciplinarity has garnered the support of elite universities. It has academic credibility. It is also supported outside the academy. There are innumerable organizations that claim it as their *modus operandi*. It is the preferred label for a variety of initiatives, from international NGOs to local artist-cooperatives. The connotation is such that to be interdisciplinary is to be at the vanguard.

So, there is much interdisciplinarity to be found. But the types are so various and the levels of sophistication so variable that the category has become too encompassing. We have put elite think tanks run by people with more Ph.D.s than fingers in the same category as middle school students painting pictures of historical events. Broad categories are not necessarily bad. I'm a big fan of universals. But we need well-behaved words—terminological clarity. Interdisciplinary is ill defined—it's dysfunctional. We need words to work so we can.

Of course, there is a general consensus that interdisciplinary work involves more than one discipline. This is an insufficient answer for a variety of reasons. It is too simple, and mainly aids those who have trouble with prefixes. Moreover, now we are stuck hunting for a definition of *discipline*. Surprisingly, few who are content with the definitional gloss offered above even follow out this next step.

Suppose we follow Gardner (2000) and talk of *disciplines* as concepts and methods for thinking about specific types of questions and phenomena; *concepts* and *methods* that have been cumulatively accepted by experts as providing standards for determining the validity of answers. That works fine: disciplines are *methodological lenses* employed by communities of investigators relative to particular phenomenon. Yet, even if we posit such a definition as correct we are still without a definition of *inter*-disciplinarity. The prefix is the problem.

Inter- as a prefix is generally taken to mean roughly *between* or *among*. Put this together with the definition of discipline offered above, and we are almost back where we started. We know more about *what* we are between and among, but not what it means be this way. I'm *between* breakfast and lunch right now, and *among* my things. Locate me appropriately in the library or science center and now I'm *between* and *among* the disciplines. Put a microscope in one hand, a copy of *King Lear* in the other, and now I'm interdisciplinary!

Thankfully, we don't have to construct a definition out of thin air. It's possible to bootstrap a definition by looking at the "evolution of interdisciplinarity" (Klein, 1990).

Interdisciplinary progenitors: a rough sketch

Humans have always wanted to be know-it-alls. Traditionally in the West philosophers have been the most avid interdisciplinarians.[1] Aristotle delineated various forms of inquiry, such as "Politics," "Poetics," "Metaphysics," etc., and maintained that the philosopher's task was to subsume them encyclopedically. The great schoolmen of the Middle Ages founded the first universities and began labeling things like theology, law, and medicine, as *disciplines* (Klein, 1991, p. 20). But as signified by the prefix, with the idea of the *uni*versity, philosophers still maintained their vision of the *uni*ty of knowledge.

However, with the Enlightenment scholarly and professional specializations began to proliferate exponentially. Here is the birth of science from the womb of modern socioeconomic conditions. The "scientification" of knowledge and the "professionalization" of science resulted in the structuring of the modern university along disciplinary lines. Alarmed by this trend, philosophers began—and haven't since stopped—continually expressing concern about the fragmentation of knowledge. As Klein (1990) notes there have always been impulses "to retain, [and] in many cases, reinstill historical ideas of [the] unity and synthesis [of knowledge]" (p.22). By the 19th century explicitly *interdisciplinary* endeavors were underway.

---

[1] We will see that most philosophers are really meta-disciplinarians. But that is ahead of the story.

To make a long and very interesting story short, the modern evolution of interdisciplinarity has been shaped by at least five factors (Apostel, Berger, Briggs, & Michaud, 1972, pp. 44-55). The following list is adapted from Klein (1990, p. 41).

1. *The development of science:*
    - Increasing specialization leading to the intersection of two disciplines, splitting up of an over-ridged discipline, or setting off into new fields, etc.
    - Attempts to define elements common to disciplines.
2. *Student needs:* The result of direct student pressure or faculty anticipation, most of the time as a protest against the parcelization and artificial subdivisions of “reality.”
3. *The need for professional training:* Educational needs based on student demands and in some cases as a result of contracts extending outside the university, therefore being linked with the 4th demand.
4. *Original needs of societies:* Particular needs and new subjects which cannot, by definition, be contained within a single disciplinary frame, such as environmental research.
5. *Problems of university operation or even admission:* The result of increasingly elaborate equipment in research centers and the need for budget management in universities, especially in regard to contract with government or the advent of a major technology such as a computer.

Clearly this is but a sketch of how interdisciplinarity came to be what it is. But even from this cursory glace both the *significance* and the *variety* of interdisciplinary motivations should be noted. We've inherited the unavoidable and crucial task of interdisciplinarity; the goal of this paper is to parse out the task demands. The goal of the next section is to give an overview of interdisciplinarity today.

Today: the lay of the land

Following our historical sketch I'd like to offer a way to define what passes as interdisciplinary today. The general trends and impulses noted above continue on today in three forms of interdisciplinary activity.

Interdisciplinary education (see Kockelmans, 1979; Jacobs, 1989; Wineburg & Grossman, 2000). Some educational initiatives explicitly label themselves as such, accurately or not. Others, like most liberal arts colleges, consider themselves as proponents of “general education,” but are labeled as interdisciplinary by others. Some that receive this label are more akin to professional training programs. The common denominator is the idea of exposing students of any age, *in some way*, to a variety of disciplines.

Problem focused interdisciplinarity (see Gibbons, et al., 1994; Klein, Grossenbacher-Mansuy, Haberli, Bill, Scholz, & Myrtha, 2001). These initiatives blur the lines between academia, business, and government. Here we find think-tanks, NGO's, and specially crafted graduate programs. The common denominator here is the combining of a variety of disciplines, *in some way*, in order to solve specific problems. The problems are various: big ”real-world” issues like global warming; high-level theoretical issues like those found in the complexity sciences; minute problems in some specific discipline likely to be solved via techniques from other disciplines, etc.

Synoptic interdisciplinarity (see Laszlo, 1972; Wilber, 1995; Wilson, 1998): These types of initiatives continue an ancient ambition, striving for “theories of everything.” The common denominator here is the summarizing or utilizing of a variety of disciplines, *in some way*, so as to give an account of very general phenomena, e.g., state of the Sciences, the World, Nature, or the Kosmos.

I see these as the three main areas of interdisciplinary energy. Of course, the lines are not set in stone. The areas bleed into one another. Proponents of synoptic accounts would like to see their theories used to solve problems. Some problem-focused interdisciplinarians have their hands in some educational endeavors. A number of educationalists shape their interdisciplinary curriculums around real problems, or synoptic theories. But generally speaking, when looking at a specific example, it is often best characterized as belonging in only one of these areas.

These labels aid us in our defining of interdisciplinarity. We've seen the history of the motivations, which have become embodied in a variety forms. There are reasons for people to pursue interdisciplinary endeavors. And there are at least three types of endeavors currently being carried out.

However, even if these areas accurately describe the current scene, they tell us nothing about what makes for a better or worse piece of interdisciplinary work. This latter way of viewing interdisciplinarity leads to the evaluative methods this paper targets. So, with our admittedly ambiguous sense of what interdisciplinarity means, we move on.

Interdisciplinarity: admitting the demands and talking about them

> *Too often in discussions of interdisciplinary training one hears calls for breadth, for comprehensiveness. Too often we attempt to produce professionals who have mastered two or more disciplines…. This orientation I will parody as the "Leonardesque aspiration": the goal of creating current day Leonardos, who are competent in all of science. As a training program it is bound to fail…. At its worst it produces a shallowness, a lowest common denominator breadth, an absence of the profound specialization which is essential for scientific productivity*. (Donald T. Campbell, 1969, p. 329)

Now we get to the heart of the matter. We've gathered a rough sense of what passes as an interdisciplinary endeavor. But the word still means too much. Having a label doesn't mean deserving it. We need to develop a shared sense of what *ought* to pass as interdisciplinary work. What are the real demands of interdisciplinary work? It will become clear that the demands are high.

As mentioned in the introduction, we will be comparing several theoretical models concerning the demands of interdisciplinarity. Let's be more specific. What we want could be called a language of evaluation. Yes, we want to sort the good work from the bad. But that task is secondary. First we need a way to justify such evaluations. We need a language that will disclose the symptoms of quality. With the right language, we can isolate and talk about the various properties of interdisciplinary work that bear on their worth. These kinds of languages are everywhere: from rubrics for grading papers to codified sets of professional standards. Languages of evaluation are valuable.

To be very clear: in this paper I don't want to actually begin sorting the wheat from the chaff. I want to begin to find a language we can use to do so. We can't argue about the relative worth of various interdisciplinary endeavors because we haven't decided what's worth arguing about. We need to admit that there are demands and agree on what they are. This entails finding ways to talk about various aspects of interdisciplinarity.

Campbell (1969) speaks to this in the quote above. In a seminal paper on interdisciplinarity he writes of "the profound *specialization* that is essential for scientific productivity" (p. 329). He contrasts this with the "Leonardesque aspirations" of most interdisciplinarians, which result in "shallowness, [and] lowest common denominator breadth" (p. 329). But make no mistake: he offers these critiques while nevertheless admitting the need for true interdisciplinarity. He's just worried about the demands of such undertakings.

To make his point, he outlines how hard it is to have an expertise in *one* discipline. You have to master the unique and specialized languages, the burgeoning bibliographies, proliferating publications, and multifaceted methodologies. Competencies are complicated. Moreover, we don't work alone: *the locus of scientific knowledge is social* (Campbell, 1969).

This is a major point. Disciplines, as mentioned in Gardner's definition above, are like communities. Disciplinary expertise is akin to a kind of membership. One needs certain competencies to participate in the community, but the inquiries undertaken out-strip any one individual. If you speak as an expert you represent your discipline. You speak on behalf of those whose expertise justifies your own.

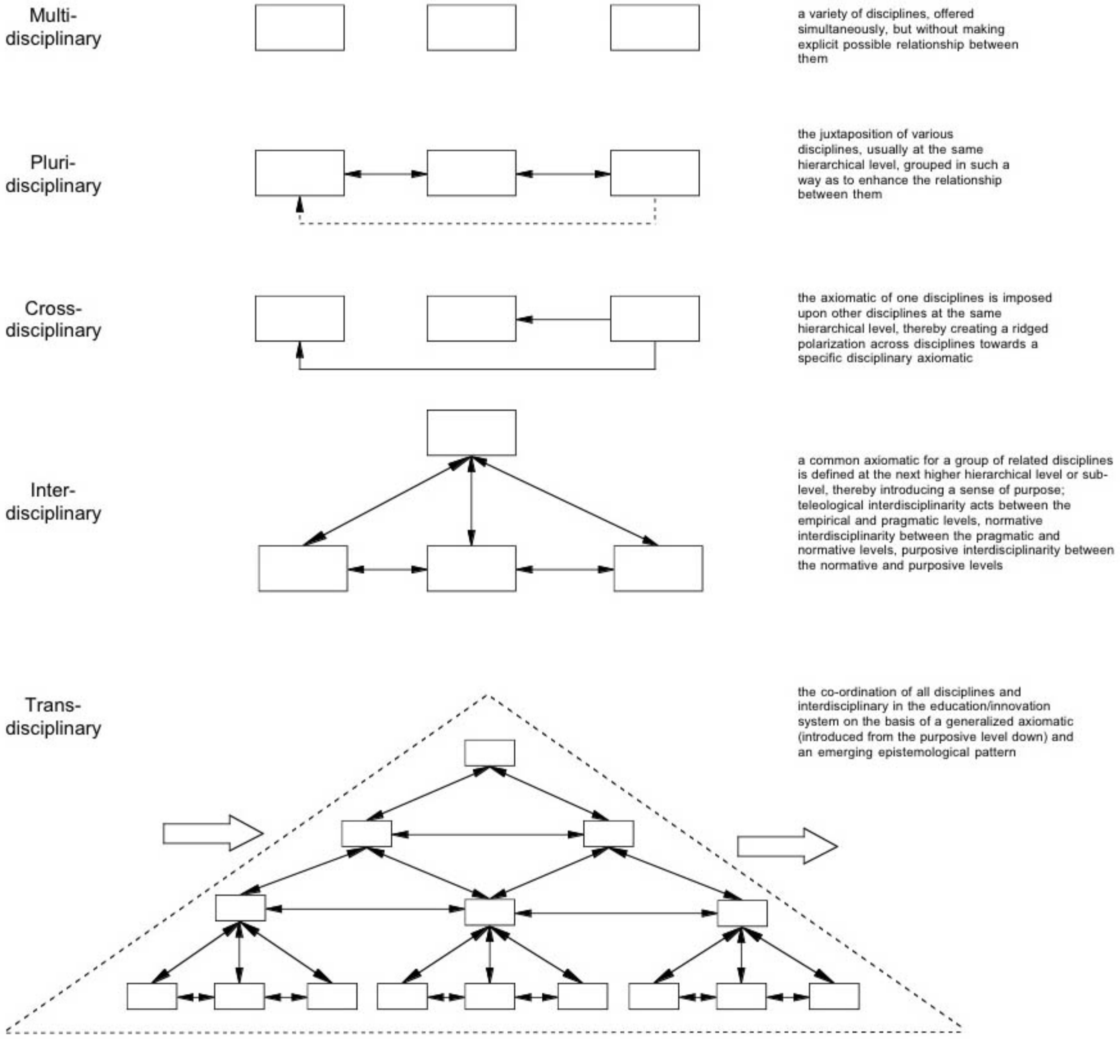
In light of these considerations, Campbell (1969) noted another demand: overcoming the ethnocentrism of the disciplines. Because disciplines are like communities, they're subject to the same political dynamics. They become insular. They have rights of passage. They get caught up in territorial disputes with other communities: academic politics as usual. Campbell saw this as a major problem. He suggested that instead of Leonardesque aspirations we should have aspirations to collaborate across disciplinary boundaries. The ethnocentrism of the disciplines inhibits this. Ideally, instead of looking to master more than one discipline (which is very hard), we should look to the competencies of others and work towards interdisciplinary knowledge collaboratively. But that's demanding, personally and professionally.

With Campbell's analysis we have begun to see what we're after. The competences of both individuals and groups must be taken into account. In light of even a rough sense of the requisite competencies, it looks like what is required for interdisciplinary work is more demanding than most think. We need to solidify disciplinary expertise, as embodied by individuals in groups, *before* we come to true interdisciplinarity. Most individuals and groups can't pull this off. More often than not, we end up with individuals who have a shallow sense of a bunch of disciplines, instead of individuals who are prepared to collaborate across disciplines as experts established in one.

Modeling the demands of interdisciplinarity

Step 1, Part 1: a hierarchy of competencies

The foregoing discussion indicates why Campbell maintains that interdisciplinarity is a complicated competence. And talking about competencies means talking about hierarchies. A long history of cognitive developmental research suggests that skills and competencies develop hierarchically (Fischer, 1980; Fischer & Bidell 2006). Tasks make demands. Meeting these demands requires skill. In light of this research it's undeniable that less complex skills come to be subsumed by more complex ones. There are stages in the acquisition of any complicated competence. Abilities range across a developmental continuum. Interdisciplinarity, as a very complicated competence, is no different.



Multi-disciplinary
a variety of disciplines, offered simultaneously, but without making explicit possible relationship between them
Pluri-disciplinary
the juxtaposition of various disciplines, usually at the same hierarchical level, grouped in such a way as to enhance the relationship between them
Cross-disciplinary
the axiomatic of one disciplines is imposed upon other disciplines at the same hierarchical level, thereby creating a ridged polarization across disciplines towards a specific disciplinary axiomatic
Inter-disciplinary
a common axiomatic for a group of related disciplines is defined at the next higher hierarchical level or sub-level, thereby introducing a sense of purpose; teleological interdisciplinarity acts between the empirical and pragmatic levels, normative interdisciplinarity between the pragmatic and normative levels, purposive interdisciplinarity between the normative and purposive levels
Trans-disciplinary
the co-ordination of all disciplines and interdisciplinary in the education/innovation system on the basis of a generalized axiomatic (introduced from the purposive level down) and an emerging epistemological pattern

Figure 1. Successive steps for increasing co-operation and co-ordination in the education/innovation system

From "Towards interdisciplinarity and transdisciplinarity in education and innovation," by E. Jantsh, in G. Berger, A. Briggs & G. Michaud (Eds.), 1972, *Interdisciplinarity: Problems of teaching and research. Proceedings of seminar on interdisciplinarity in universities, organized by the center for educational research and innovation* (pp. 97-121). Copyright 1972 by the Organization for Economic Co-operation and Development. Reproduced with permission of the publisher.

Some have seen this. Jantsh (1972) did. He suggested that interdisciplinarity is best understood as an attainment (see Figure 1). It is a particular type of endeavor with a particular set of demands. He outlined a hierarchy of forms of inquiry, defining each according to the structure and complexity of its practices. He made it very clear that interdisciplinarity is relatively complicated, as compared to say, disciplinarity. He also made it clear that more complex forms of inquiry build upon less complex ones. That is, you can't be an interdisciplinarian before you are a disciplinarian. This is great. We've got the beginnings of a normative account. But his model is not sufficient for our purpose of developing a language of evaluation.

One reason is that he blurs the distinction Campbell alluded to between the two types of competencies involved: the competencies of people and the competences of groups. We need to address both what it takes for an individual to meet the demands of interdisciplinarity and what it takes for a group to do so.

There is also a certain arbitrariness to Jantsh's hierarchy. Why that many levels? Why those structures? There are well-established models outlining the structural properties of cognitive developmental stage growth (Commons, Trudeau, Stein, Richards, & Krause, 1998; Fischer & Bidell 2006). That is, we know what the hierarchical nesting of competencies looks like. We don’t have to guess. Even if we are speculating, we can keep in touch with what we know. In light of these two issues I've revised Jantsh's model. Table 1 displays a *speculative* cross-sectional, hierarchal taxonomy of forms of inquiry based on Fischer's (2006) levels. Competencies of groups are built from various competencies in people, but levels aren't correlatives, e.g., a bunch of multi-disciplinary people don't necessarily form a multi-disciplinary group; a trans-disciplinary group is not necessarily filled with trans-disciplinary people.

Table 1. A cross-sectional, hierarchal taxonomy of forms of inquiry

Form of inquiry	Competencies of people	Competencies of groups
Disciplinary	**Requisite level of cognitive development:** Highly Elaborated Abstract Mappings. Individuals demonstrate understanding of one set of conceptions and one methodological approach. They are able to generate unique questions and contribute new research and findings in this area.	Group is able to produce new knowledge (or confirm exiting knowledge) in a specific discipline by employing one set of concepts and methodologies.
Multi-disciplinary	**Requisite level of cognitive development:** Abstract systems. Individuals demonstrate disciplinary competence, and understand that their endeavors must be related to the endeavors of others in surrounding disciplines. They therefore come to know and use some concepts used in these disciplines.	Group is able to demonstrate disciplinary competence and relate the results produced by surrounding disciplines to its own, and relate its own results to others (e.g., communication between disciplines).
Cross-disciplinary	**Requisite level of cognitive development:** Highly Elaborated Abstract systems. Individuals demonstrate disciplinary competence and know how concepts and methodologies from other disciplines relate to in their own, having mastered some concepts therein. They are able to constructively communicate with those from other disciplines in a problem-focused manner.	Group is able to demonstrate disciplinary competence and to constructively collaborate with groups from other disciplines in a problem-focused manner.

Form of inquiry	Competencies of people	Competencies of groups
Inter-disciplinary	**Requisite level of cognitive development:** Single principles. Individuals demonstrate at least two disciplinary competences. One is primary, yet they are able to employ the concepts and methodologies of other another discipline well enough to contribute to the questions and findings therein. New understandings of the primary discipline result.	Group subsumes at least two disciplinary sub-groups, with one as primary focus of expertise. Capable of solving problems that cannot be addressed by either discipline, typically in a problem-focused manner.
Trans-disciplinary	**Requisite level of cognitive development:** Beyond single principles. Individuals demonstrate at least two disciplinary competences, neither of which is primary. They work and contribute to both and generate unique findings, conceptions, and artifacts as a result of an emergent trans-disciplinary perspective. They are able to communicate with those from a variety of disciplines in a synoptic manner.	Group subsumes at least two disciplinary sub-groups, neither of which is primary. Produces both problem focused and synoptic knowledge, which cannot be reduced to either of the sub-group competencies. It is capable of spawning new disciplines, and reforming existing ones in light of emergent perspectives.

I've based this taxonomy on Fischer's model of cognitive development, which entailed that one of Jantsh's levels be removed (pluri-disciplinary). I've also clearly differentiated the competencies of people from the competencies of groups. The result is a detailed taxonomy of forms of inquiry and their demands on individuals and groups.

With its base in Fischer's established research, the taxonomy is presented as a hypothesis that could be empirically refined and tested. No doubt, it's a simplification. But relative to the rampant *over-simplifications* involved when we apply the label interdisciplinary to everything and anything, I propose this taxonomy as a useful *complexification*.

It also provides the beginnings of a language of evaluation. We can now look at an endeavor and argue about where it belongs in this taxonomy. Moreover, because we can talk about the demands, we don't have to compare the results of two very different forms of inquiry. We can calibrate our expectations. We can more precisely zero in on the symptoms of quality. For example, a group of experts claiming to do interdisciplinary research should be meeting the requisite demands and not just disguising some other form of inquiry with a buzz-word; a group of undergraduates struggling to solidify disciplinary expertise should not be expected to be interdisciplinary, but should strive for multi-disciplinarity and be evaluated accordingly. The words *developmentally appropriate* come to mind.

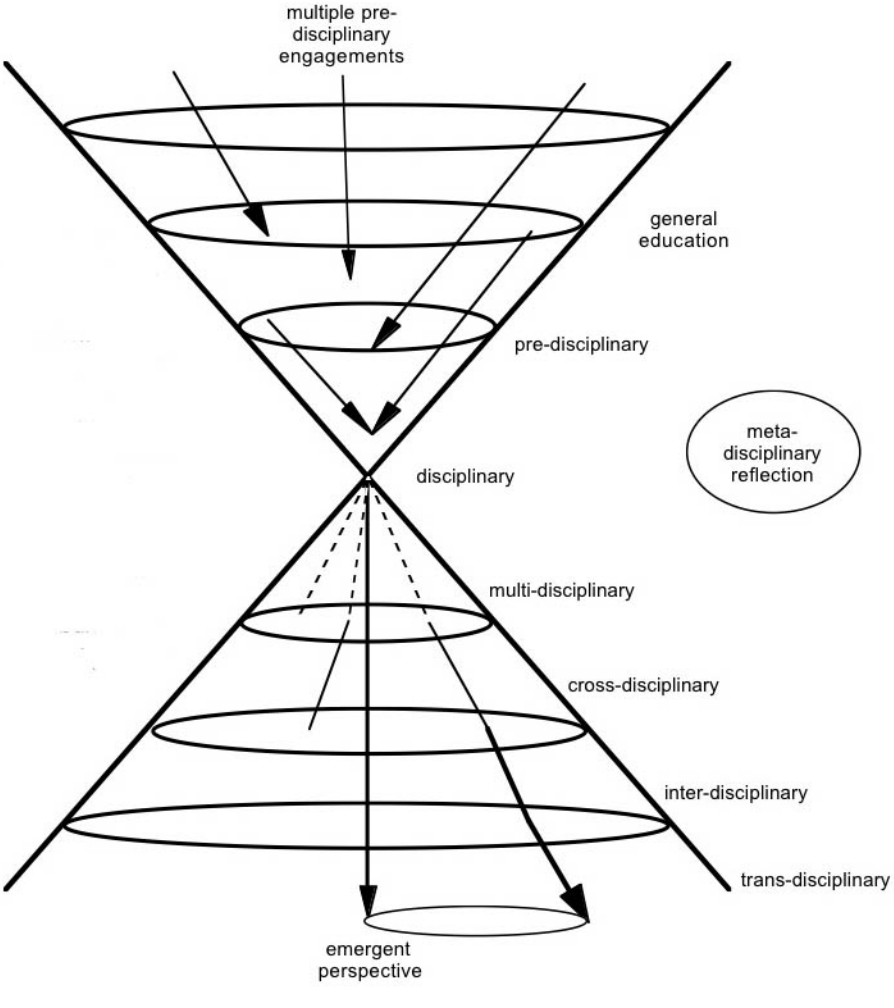
Step 1, part 2: what about the young ones (and the philosophers)?

There could be concerns that the forgoing scheme is too elitist. What about all the great stuff that happens when students, who are by no means experts in any discipline, are exposed to a wide range of approaches and concepts? Am I suggesting that there should be no such exposure? Am I relegating everyone to parochial disciplinary channels until they've paid their dues? Am I suggesting that we have to be specialist before we be come generalists?

No. I just think we should clarify what is really going on.

Figure 2 offers some clarification. This figure is primarily about how individuals come to acquire capabilities. I am suggesting that *general education* be defined as an exposure to multitudinous *pre-disciplinary* endeavors. I believe that this kind of broad exposure is invaluable. However, at some point, for many people, disciplinarity should be acquired. This means that one limits one's focus for a time. Expertise, and the process of developing it, is exacting. As Campbell said, "we need to gain the profound specialization that is essential for scientific productivity" (1969, p. 326). Only then we can we begin to branch out and relate our expertise to the expertise of others.

This dynamic is illustrated in Figure 2. Various pre-disciplinary arrangements constitute a well-rounded general education. Eventually, disciplinary expertise is acquired. This expertise is progressively supplemented by knowledge of other disciplines. Finally, trans-disciplinary expertise is achieved, where emergent perspectives become available. Meta-disciplinary reflections about epistemological relations between the disciplines, goals of inquiry, etc., should exist alongside the growth of knowledge.



multiple pre-disciplinary engagements
general education
pre-disciplinary
meta-disciplinary reflection
disciplinary
multi-disciplinary
cross-disciplinary
inter-disciplinary
trans-disciplinary
emergent perspective

Figure 2. Funnel of expertise

Also note that in Figure 2 I've singled out the idea of meta-disciplinary reflection. This is also addressed to those feeling claustrophobic about being forced into disciplinary channels. Meta-disciplinary reflections are often neglected. Ideally they would serve to give even the most focused expert a broader view about the nature of their discipline. The goals of inquiry would be put on the table. It would be admitted that other disciplines exist and generate valid knowledge, that each discipline knows only a piece of the world. And so, even the disciplinarian with no interdisciplinary ambitions would take a big view. In many ways this is the role of philosophy.

Moreover, because the demands of interdisciplinarity are so complicated (as we are beginning to see) I claim that meta-disciplinary reflections should accompany endeavors at any level of sophistication. They ought to run in parallel. This means that meta-disciplinary reflections don't sprout out of the top, like trans-disciplinary perspectives. They frame and facilitate. They’re not the capping stone; they're the scaffolds. They're not the product but the catalyst, not the endeavor but its justification. I will say more about this when we discuss Wilber's meta-disciplinary model of integral methodological pluralism.

But first we need an introduction to the epistemological issues.

Modeling the demands of interdisciplinarity: Step 2 - epistemological issues

What have we done so far? We have dissected a vague concept: *interdisciplinarity*. A model has been presented suggesting that there is a hierarchy of forms of inquiry. The claim is that in light of such a model, undertakings that involve more than one discipline can be analyzed and grouped according to the complexity of the concepts and practices entailed. This claim stands even if the demands outlined above are inadequate or inaccurate. The main point is that we need a more precise language with which to talk about these kinds of endeavors. Maybe some other one is preferable. Fine. But *something* like what I've suggested needs to be devised and widely employed.

The same can be said about the models laid out in this next section. The demands outlined above help us diagnose and categorize forms of inquiry involving more than one discipline; some are more complex than others. The demands outlined here help us condemn or condone certain inquiries, regardless of their complexity; some are more valid than others. This second field of considerations is epistemological. And the territory is contested.

There is not one way to view the epistemological tangles surrounding inquiries involving more than one discipline. I base my account around some *very general* issues. I'm laying out the forest and ignoring some of the trees.

We've already met one very basic epistemological difficulty by claiming that multi, cross, inter, or trans-disciplinary work must build upon disciplinary work. We don't have to deal with epistemology *qua* the problem of knowledge, because we've seen that disciplines have their own internal methods of quality control. It's part of what makes them what they are. Remember that Gardner's definition went something like this: disciplines are sets of *concepts* and *methods* aimed at certain phenomena, which have been accepted by experts as providing *standards for determining the validity of answers*. This definition removes some of the most basic epistemological / philosophy of science concerns. For our purposes we'll take the disciplines at their word: they generate knowledge. But what about endeavors involving more than one discipline? How should we characterize relationships between different disciplines?

Jean Piaget (1972) maintained that there are symbiotic relations between the disciplines. None are more primary than others. They feed off one another. The knowledge produced by one is often taken as the data used by another. He also maintained that there is some common core to all science: *structures*, the formalized systems of relations that are required to do any kind of science. Phenomena make sense in light of the structures we posit to understand them. Moreover, he was intrigued by the similarities between the structures posited by the various sciences, and even prophesized their convergence in a kind of universal "genetic [i.e., developmental] structuralism." So homogeneity was grist for his mill. But overall, he saw heterogeneity as a virtue. There is unity in diversity, not just unity.

So despite the fact he saw certain formal similarities between the disciplines, he was still cautious about forcing homogeneity. That is, he was concerned about reductionism. He would have us note the differences between *levels of analysis* and the differences between *the human and the natural sciences*. Piaget's two notes of caution are the two main points covered next.

Step 2, Part 1: levels of analysis

The idea that there are levels-of-analysis issues is widely touted. Roughly speaking it means this: that with regards to some type of phenomenon and from some basic perspective there are different valid descriptions and explanations. A classic levels-of-analysis issue is the relation between physics and biochemistry (see Sellars, 1963/2007). The question here is about the relation between the theoretical concepts and methods of biochemistry and those of physics. We have two disciplines, both setting out from the same basic perspective towards the physical world, but addressing ostensibly irreducible phenomena via distinct methods. I say that the phenomena are ostensibly irreducible because there are many who maintain that the explanatory concepts of biochemistry are in fact reducible to those of physics. The point here is not to take a stand on the issue, but to note the debate. And there are many such debates regarding level-of-analysis issues.

In these debates, according to some, levels-of-analysis issues always amount to this: with regards to some type of phenomenon there are different descriptions and explanations, and only those positing the smallest / simplest / most material,/ etc. are valid. This is suggesting that there are levels of illusion layered on top of some most basic, most real, foundation. We could label this as a type of reductionism. Now, I'm not saying there are no illusions. Nor do I think that all the disciplines are equally valid in their descriptions of phenomena. However, if two disciplines are cooperating in a common endeavor there should not be unwarranted privileging of certain disciplinary perspectives.

This is just to say that we need to be careful when different disciplines get together. As noted by many philosophers, including Piaget (1972), Sellars (1963/2007), Habermas (1984), and Wilber (1995), there is a tendency towards reductionism in interdisciplinary endeavors. This tendency makes levels-of-analysis issues an important addition to our language of evaluation.

The next section deals with another set of distinctions worth preserving.

Step 2, Part 2: the human sciences and the natural sciences

That this topic has its own section may be confusing to some. Many think that this topic is a levels-of-analysis issue. Following Piaget and others, I want to argue that it is not. The idea is this: levels of analysis are different descriptions of phenomena viewed *from the same basic perspective*; while the human and natural sciences actually involve *different basic perspectives*. Kant, Habermas, and Wilber make this point very clearly.

Kant (1787, A 550/N 578) makes a distinction between two *basic perspectives* we can take on human actions. From *the theoretical perspective* (the view of natural science) causes and forces *determine* human actions. Humans are objects nested in systems of causes with other objects. From *the practical perspective* (the view of a participant observer) actions result from the spontaneity of the agent, and occur for reasons typically available to that agent. Humans are subjects reasoning and acting autonomously. For Kant this is an antinomy: both views are equally valid.

Habermas (1984, 1990) concurs. He proposes a model of communicative rationality in which different forms of argumentation and language-use reveal different incontrovertible perspectives on the world. He notes two forms of language use (1990, p. 24), one in which *you say (to yourself) what is the case*, the other in which *you say something to another and establish mutual understanding*. He sees these as indicative of basic perspectives: in the first perspective *we relate to objects*; in the second *we relate to others like ourselves*. No doubt, all sciences involve communications between scientists. But in the human sciences the communicative perspective is ubiquitous; we are necessarily *participant observers*. Natural scientists talk to one another, but not to the objects they study; they take an *overtly objective* view of these phenomena.

Wilber (1995, 2006) gets right down to the point. He posits several “primordial perspectives,” and following Habermas and Kant links them to our most basic pronouns: I, WE, and IT. There is a big difference between relating to objects (I - It) and relating to other subjects (I - thou = WE). He suggests that some of the most important methodological differences between the disciplines hinge around these primordial perspectives. He offers a model based on these perspectives that can serve to scaffold a taxonomy of methodologies.

With these basic ideas the point should be clear. Not all complications that arise in inquiries involving more than one discipline are levels-of-analysis-issues. There are more basic *perspectival issues* as well. The paradigmatic cases of such issues can be found when we try to merge the human sciences with the natural sciences.

For example, medical diagnostics and neurological accounts of the mind entail applying the basic perspective of the natural sciences to human subjects. We set out from a perspective in which we face only objects; here we take an *overtly objective* view of a human. That's fine. We need that kind of knowledge. But more often than not these come to be nested in broader efforts involving multiple disciplines, such as efforts towards healthcare or education. In cases like these we run the risk of denying the validity of disciplines setting out from other basic perspectives, such as richly *inter-subjective* practices like psychotherapy, ethics, or pedagogy. *These* set out from a perspective in which we face other subjects like ourselves. We may gather data and strive for objectivity as participant observers, but when we study humans we never relate to mere objects.

So the human sciences set out from a fundamentally different basic perspective than the natural sciences. Blurring the distinction is not only dangerous; it's fallacious. Human scientists misunderstand their endeavor if they think they can simply treat subjects as objects. I don’t have space to outline the methodological and ethical implications of this (but see Habermas, 1984, 1987, 1990; Wilber, 1995).

Summary of Step 2’s epistemological point

We've seen two different epistemological issues that are relevant to endeavors involving more than one discipline. There are *levels-of-analysis issues*, and *perspectival issues*. Both should be on every interdisciplinarian's radar. And they should be added to the language of evaluation we've been constructing. But before discussing this, I offer Figure 3 as a way of making the epistemological points stand out.

Disciplines set out from different basic perspectives and so face different domains of phenomena, where they home in on different levels of analysis. Inquiries involving disciplines setting out from the same basic perspective deal with levels-of-analysis issues. Inquiries involving disciplines setting out from different basic perspectives deal with perspectival issues.

Figure 3. Sources of levels-of-analysis and perspectival issues

What Figure 3 adds to our language of evaluation should be clear. We've isolated two epistemologically-salient properties that bear on the worth of endeavors involving more than one discipline: *levels-of-analysis issues* and *perspectival issues*, which are not to be seen as coterminous. We can now argue about how various undertakings fare with regards to *the epistemological structure of knowledge claims involving more than one discipline*.

These reflections also suggest that reductionism is not so simple. If we're striving to envelop various disciplines—as educators, problem solvers, or researchers—we can’t just presuppose that there are privileged perspectives and levels of analysis. If we keep the epistemological issues on the table, then we need reasons for every reduction. We need to account for every level or perspective we ignore. Otherwise, we fall back behind our claim to have employed more than just the discipline we favor. Disciplines demand differentiation *before* they are available for integration. This doesn't mean that everything out there is valid. But to spawn healthy endeavors involving more than one discipline the default epistemic position should be one of open-minded disciplinary tolerance, not one of skeptical disciplinary xenophobia.

Conclusion: Integral Methodological Pluralism

I'll recap the story to this point. We began by noting that the term interdisciplinary means too much. It's over used. In search of a more specific definition, we discussed the progenitors of contemporary interdisciplinarity, which revealed the *significance* and *variety* of interdisciplinary motivations. Moving forward from this historical context we turned to the contemporary scene to see the various forms of what passes as interdisciplinarity today. This rounded out our descriptive account and provided a rough sense of what interdisciplinarity is generally taken to be. However, evaluating interdisciplinary endeavors, of whatever type, requires more than a descriptive undertaking. So the project of building a language of evaluation began where the descriptive accounts left off.

It became clear that the *competencies* of individuals and groups bear upon the quality of interdisciplinary work. By looking to work done in cognitive development, we formed a hypothesis that there is in fact a *hierarchical taxonomy of forms of inquiry involving more than one discipline* (Table 1). By taking the development of competencies seriously (both in individuals and in groups) we effectively differentiated the following set of endeavors, each more complex than the next: multi-disciplinary, cross-disciplinary, inter-disciplinary, and trans-disciplinary.

But this hierarchical taxonomy based on *complexity* was seen to be in need of supplementation by an epistemological taxonomy concerned with *validity*. So we looked to a handful of philosophers to distil the general *epistemological structure of knowledge claims implicating more than one discipline*. This involved differentiating between levels-of-analysis issues and perspectival issues. Perspectival issues concern fundamentally distinct and irreducible stances towards the world: most importantly the difference between standing in relation to *others* vs. standing in relation to *objects*. Levels-of-analysis issues concern differing descriptions of comparable phenomena disclosed from the same basic perspective: e.g., biochemistry vs. physics. These are two *types* of epistemological concerns that arise in endeavors involving more than one discipline. As such, they must be added to any language used to evaluate the quality and validity of these endeavors.

While our lexicon for interdisciplinary evaluation is not lengthy, it is robust.

We've sketched the contours of important competences and fallacies. Understanding these helps us understand what it really takes to be interdisciplinary. Moreover, and to conclude, it also suggests an ideal *modus operandi* for endeavors involving more than one discipline. I claim that the ideal of an Integral Methodological Pluralism (Wilber, 2006) is supported by both the hierarchal taxonomy of competencies and the epistemological concerns.

As it stands, Integral Methodological Pluralism is a meta-disciplinary framework that specifies a taxonomy of disciplines organized around eight primordial perspectives. It's laid out against a backdrop in which cognitive development figures prominently, knowledge is verified procedurally, and reductionism is on the radar as a major concern. All this makes it very close to the account offered here.

But more importantly, and to break slightly with the orthodoxy, I claim Integral Methodological Pluralism is less significant as a *substantive* view (e.g., *exactly this many methodologies*; *only this many levels*, etc.) and more significant as a *formal*, *normative* *perspective* on how we ought to proceed when endeavoring to employ a variety of disciplines. This interpretation is not far from the one proposed by Crittenden (1997), where he suggests that the integral method trumps its substance, and that this method is best understood as a type of *critical theory*. That is, the "Integral Vision" does more than describe how various methods hang together; it offers a *regulative epistemic ideal* in light of which less than integral approaches can be criticized. Similarly, I see Integral Methodological Pluralism as a *normative meta-disciplinary inquiry catalyst* that can be unpacked at any level of competency to insure a healthy manifestation of interdisciplinary energies.

However, what has been laid out in this paper is not contingent upon this interpretation of Integral Methodological Pluralism. I mention it because meta-disciplinary languages of evaluation are in short supply. We should see what's available. And I see it, like I see the work done here, as an attempt to bring clarity to confusion by outlining a meta-disciplinary framework with normative bite. Of course, we need more meta-disciplinary knowledge workers and concomitant institutional structures if any of this is to fly. It is clear to me that new types of inquiry-based future-oriented communication communities will emerge and that meta-disciplinary models will be needed to orient their epistemic endeavors. The more we want and need to know, the more we'll need to clarify to ourselves what we are up to. Quality control becomes paramount as interdisciplinary knowledge production proliferates.

Integral Re-views Postmodernism: The Way Out Is Through

Gary P. Hampson

Abstract: In this article I re-evaluate the potential contribution of postmodernism to integral theory via integrally-derived perspectives. I identify a premature foreclosure: the underappreciation of postformal modes of thinking (cognitive development beyond Piaget's *formal operations*). I then enact certain forms of postformal reasoning in relation to integral theory. This includes an engagement with such perspectives as complexity theory, conceptual ecology, vision-logic, dialectics, genealogy, critical theory, and construct-awareness. A major theme concerns the dialectical relationship between reconstruction and deconstruction—partly explored through a developmental assessment of contra-indicative discourse by both Wilber and Derrida. Although the territory is complex, the relationship between current Wilberian theory and postmodernism is clearly problematised. I posit that a deeper engagement with postmodernism can lead to an autopoietic deepening of integral theory.

Keywords: autopoiesis, construct-awareness, Derrida, dialectics, Gebser, Green vMeme, integral theory, postformal, postmodernism, recursion, vision-logic, Wilber.

Introduction

> *You could not discover the limits of soul, even if you travelled by every path in order to do so; such is the depth of its meanin.* (Heraclitus, 42).

Integral theory[1] has the potential to be a valuable conceptual tool for a host of purposes. Its potential would be thwarted or skewed, however, if it is found lacking in sufficient rigour or coherence. Ken Wilber's integral theory, AQAL, has popular appeal, and is panoramic in scope with a firm sense of order. As such, AQAL is a powerful player in the *integral* terrain, and Wilber's theoretic contributions need to be duly considered to advance integral theory in general. In part, this means they need to be brought into adequate dialogue with other pertinent contributions (whether they be termed *integral* or not). Further, the conceptual terrain AQAL broadly *maps* needs to be *explored* in careful detail (Roy, 2006a). From an integral background,[2] I have been exploring such terrain. What follows is a pertinent bricolage[3] chronicling a journey from *viewing* postmodernism—as given—to *re*-viewing postmodernism afresh. Notably, it would seem that certain sections of the integral community hold ideas concerning postmodernism that may well be partial truths at best. I hope this exploration can help dispel any falsity in such pertinacious myths.

In terms of the terminology I am using here, I note that *postmodernism* is a highly contested term, such that it can even be seen to have contradictory meanings. I will not be using the term to infer certain features that might elsewhere be attributed to "late capitalism," for instance. (Late capitalism is still capitalism and should therefore remain mapped within AQAL's Orange vMeme—*modernism*.) Instead, my use of the term in this article is intended at the outset to signify AQAL's Green vMeme, thus including both collective and individual dimensions. The collective dimension is sometimes referred to simply as *postmodernism* in certain contexts and *poststructuralism* in others,[4] whilst the individual dimension refers to *postformal* thought: cognitive development beyond[5] Jean Piaget's *formal operations*[6] (formal operational thought uses if-then linear logics and evidence-citing to make its *arguments*). The potential area is vast and a comprehensive review could not be adequately accomplished in one article. Nevertheless, sufficient openings can be offered to identify and further this liminal terrain. Specifically, the following idea is explored: The way to deepen integral theory is *through* postmodernism (by explicitly thinking postformally), not against it.[7]

---

[1] I am using the term *theory* broadly to connote *theoretic narrative*.

[2] Including (a) familiarisation with Wilber's corpus (1995-present), (b) being a member of two face-to-face Wilber discussion groups (2000-2005; London & Sydney) and originator of a third (2001-2002, London) (c) completing a postgraduate course in integral futures (Swinburne University, Melbourne, 2003) (d) core involvement with the Integral Education Forum (2004-2005), (e) participating in an Integral Transformative Practice seminar (2005, Colorado), (f) consulting for the Integral Institute (2005, Boulder)

[3] I am using the term, *bricologe*, as inspired by Kincheloe and Steinberg (1993).

[4] It is sometimes taken as the *philosophical* expression of postmodernism, for instance. Derrida, Deleuze and Foucault are often called poststructuralists, although it is important to note that this is not an identification which they themselves adopted.

[5] The term, *beyond*, can infer a number of possibilities. My default interpretation of the term in this article is in reference to Wilber's "transcend and include."

[6] For an important historical marker in the development of this field, see Commons, Richards, & Armon (1984); for a salient contemporary review, Susanne Cook-Greuter's (2007) website is worth exploring.

The Logic of Integral Vision

In terms of honouring integral theory, many elucidations could be given. Here, I simply wish to highlight the *logos* of logic: There is *logic* to integral vision—in all senses of the word. Firstly, integral conceptualisations foreground the significance of formal reason. Secondly, in this current era—perhaps aptly seen as "the best of times…the worst of times"—there is sense or logic in developing an integral vision—as an eco-social imperative.[8] Thirdly, integral theory carries the promise of cohering postformal logics.[9]

A commonly held default understanding is that integral and postmodern signify very different beasts. In such a characterisation, postmodern connotes incredulity toward grand narratives (à la Lyotard[10]), and a privileging of particularity, sensibility, nonlinearity, flux, liminality, and divergence (via Derrida's différance and déconstruction). In contrast, integral connotes the credibility of (certain) grand narratives, and a privileging of universality, content, linearity, structure, definition, and convergence (coherence and construction). Such a characterisation is reinforced by Wilber's foregounding of the decisive differentiation between AQAL's Green vMeme and those Wilberian vMemes which are theorised as transcending it.[11] Such is the given integral view of postmodernism. It is not, however, the only possible one: Wilberian integral theory itself can be used to identify a different perspective on postmodernism.[12]

---

[7] To adequately address the many facets of the subject matter, this article is necessarily relatively lengthy, and also features a few unorthodox "stylistic" elements. Due consideration should be thus given to this with respect to the reader's *mode of participation* (as discussed & facilitated below).

[8] This might be regarded (dialectically) as *the logic of—an integral—logos* or text

[9] On a more personal note, I wish to honour the contribution that Wilberian integral theory has made in my intellectual development. As such, the critique below is not meant to infer an opposition to integral theory, but rather to open up possibilities of deepening it. This process necessarily involves both deconstructive and reconstructive elements, yet I enact both from constructive desire. I will no doubt sometimes stray from the appropriately wavy course I seek to find and follow, but when I do, I hope to be able to discern unruly attachment, and bend my ear toward peers' and colleagues' comments!

[10] Lyotard's (1984) necessarily-translated words are: "In contemporary society and culture—postindustrial society, postmodern culture—the question of the legitimation of knowledge is formulated in different terms. The grand narrative has lost its credibility, regardless of what mode of unification it uses, regardless of whether it is speculative narrative or a narrative of emancipation" (p, 37). In this quotation, Lyotard appears to be describing his understanding of the status of certain discourses of which he was aware at the time he was writing. From the statement alone, it is unclear whether Lyotard's affective perspective on this information is detached, appreciative or regretful. It would, of course, be illogical for the statement to be interpreted as a totalising narrative concerning the fate of *all* grand narratives. As such, even from this iconic—perhaps infamous—statement, there is window of opportunity in which integral narratives, which appropriately *defer* to postmodern considerations, might be open to legitimation from such a nominally futile perspective.

[11] Wilber's Green vMeme includes: postmodernism, which he often refers to as "extreme postmodernism" or "deconstructive postmodernism"; relativism, often referred to as "extreme relativism"; and deconstruction. Its placement—along with all the preceding vMemes—as being located in the "first tier" (of Spiral Dynamics theory) is foregrounded by Wilber, partly through his catchy—fun but derogatory—phrase, "mean green meme." In contrast, the proceeding "second tier," starting with the Wilberian Teal vMeme (formerly known in AQAL as the Yellow vMeme) is mostly rendered as substantively offering the solution to Green's failings and excesses.

Revisioning Integral Logic

Integral theory can be used to re-view postmodernism by way of foregrounding the latter's theoretic agency rather than adopt the default prioritisation of its mapping as object of study. In so doing, postmodernism may reflect back upon integral theory and open up new ways of thinking. In other words, the "way out" from the modern world(view) to integral level(s), integral understanding, integral participation, is *through* including the full contribution that the Green vMeme can offer.

A key to this re-viewing lies in postformal cognition—mapped in AQAL as lying within the upper (i.e., individually- rather than socio-culturally-related) quadrants[13] of the Wilberian Green and post-Green vMeme developmental levels. Put simply, a more distinctive differentiation could be drawn between the object of inquiry and the type of thinking used to inquire. When the commonly-held default interpretation of *postmodern*—as object of inquiry—is regarded, what kind of operation is being performed? Specifically, what developmental level of cognitive mode is being employed to realise such a perspective? Postmodernism, or integral theory—as objects of inquiry—can be viewed from different developmental perspectives, but, to date, in terms of developmental considerations, Wilberian theory has foregrounded the locating of *objects* of inquiry rather than the developmental locating of *modes* of inquiry (epistemologies or methodologies). Whilst Wilber's Integral Methodological Pluralism (Eight Native Perspectives) differentiates epistemologies or methodologies *horizontally*—according to zones or quadrants—it remains unclear which *vertical* developmental levels or waves these perspectives operate from.

In terms of reflexivity, moreover, Wilber (1995) briefly states the following

> What I am trying to do in this book, and what you are trying to do as you read it (or other similar books), is use vision-logic; not just reasonably decide the individual issues, but hold them all together at once in mind, and judge how they fit together as a truth-vision. In other words, vision-logic is a higher holon that operates upon (and thus transcends) its junior holons, such as simple rationality itself (p. 185).

Here, Wilber states that he is trying to use vision-logic, but he does not state whether he is using "early," "middle," or "late" vision-logic.[14] Nor does he substantively elaborate upon which

---

[12] By differentiating between, on the one hand, the participatory stance *Wilber* enacts in relation to AQAL, and, on the other hand, *alternative* modes of engagement with AQAL interpretations (such as the *autopoiesis* I am offering here), I am suggesting a manoeuvre that might facilitate a bridging between AQAL and the participatory integral approach identified by Ferrer, Romero and Albareda (2005).

[13] For an explanation of Wilber's four quadrants—a central feature of his integral theory, AQAL, see Wilber (2000a, pp. 67-72) Note will also be made here that Wilber has elaborated *the four quadrants* into *the eight native perspectives* (see 2006b)

[14] "Where the green meme [sic] uses early or beginning vision-logic in order to grasp the numerous different systems and contexts that exist in different cultures, second-tier thinking goes one step further and begins to *integrate* those pluralistic systems into integral and holistic spirals and holarchies (Beck and Cowan themselves refer to second-tier thinking as operating with holons)…

particular postformal cognitive modes he is employing, or explicitly demonstrate such usage. How dialectical is AQAL? In what way complex? What is its relationship to critical theory (see for instance, Anderson, 2006) and critical thinking? How reflexive is it? What genealogies and conceptual ecologies are employed? How (much) has it embraced *the linguistic turn*? Important questions—which this article does not attempt to answer, but rather, put on the map.[15] In other words, the aim of this article is not to comprehensively assess integral theory—specifically AQAL—by means of postformal thinking, but rather to open up discursive spaces or Deleuzian "lines of flight."[16]

A consequence of Wilber's minimal reflexivity on postformal thinking (rather than the copious mapping of postformal thinking) is that there has been a substantive underappreciation or premature foreclosure regarding the potential contribution that postmodernism—in all its guises (not only pluralism, for instance)—might make to integral theory. By re-viewing the contribution of postmodernism or the Wilberian Green vMeme from this different integral perspective—the perspective of postformal cognitive modes—a potential inversion can be identified between the inquiring subject and the object of inquiry, where the inquiring subject changes from a default "integral" thinker (in which AQAL mapping is the primary operation) to a postmodern one (as a postformal thinker) whilst the object of inquiry changes from postmodernism to integral theory in order for integral theory to discern and digest this new reflexivity, and thence to be able to proceed more coherently. The bigger theoretical context all the while remains integral theory: AQAL is being applied upon itself, enacting a certain autopoiesis via the participation mode of the researcher. A theoretic re-searching. New questions arise such as: What new understandings of integral theory might arise from explicitly detailing and employing postformal modes of cognition upon itself? The territory envisaged is vast; hence, at this stage, I can seek only to open up this avenue of thought—to tentatively start to develop a conversation. Yet such a direction has the potential to revise the very fabric of integral theory.

"There are two major waves to this second-tier thinking (corresponding to what we would recognise as middle and late vision-logic)" (Wilber, 2000a, pp. 51-52).

[15] My tentative use of postformal operations in this article does not imply that Wilber does not enact particular postformal operations in particular ways with regards to AQAL. For instance, the breadth of territory covered in AQAL could be associated with postformal vision; the value of its mission potentially legitimised with reference to fuzzy logic and its "*transcendent*" relations, fuzziology and social fuzziology (Dimitrov & Hodge, 2002, p. viii); its systematisation can be viewed in relation to Michael Commons and Francis Richards' Model of Hierarchical Complexity; the eight native perspectives can be seen to be a dialectical development of the four quadrants; Wilber's purported methodology of orienting generalisations could be fruitfully linked to grounded theory, intuitive inquiry and other emerging academic methodologies; his style could be viewed in relation to certain postmodern affectivities; whilst the incorporation of holarchy via Hegel's dialectical principle of *sublation* (Wilber's "transcend-and-include") can also be seen to emanate from a postformal perspective. In a similar way, both formal and pre-formal operations could also be identified. The degree to which Wilber explicitly reflects upon such postformal modes in relation to his writing also needs to be identified: he does this very little, relative to the objects of his inquiry.

[16] The facilitation of such dialogue at this juncture will necessarily involve *particular* assessments which lean towards problematisations with a view to future reconstructions.

Postformal Thinking

Integral theory can be revised toward further coherence by way of postformal cognitive modes if the following turn is made: that these modes are reflexively embodied—enacted as modes of participation—rather than merely addressed (through the enactment of mapping). The operation of mapping can provide a first-stage conceptual reflexivity in certain contexts, and can evaluate participatory characteristics. But qualities of participation also have to be adequately regarded as an important theoretic feature and thus incorporated as part of integral theory. Addressing the developmental levels of engagement and participation could be a major consideration in postformal reasoning.[17]

Postformal thought is discussed primarily in three fields: developmental psychology, education and integral studies. After a very brief overview of some of the features of these three discourses, I will suggest ways to deepen and cohere the territory. I will then outline the way I will be applying postformal cognition to the object of inquiry, integral theory.

Reviewing Postformal Thinking

The term *postformal* first erupted within developmental psychology in reference to possibilities of going beyond Jean Piaget's developmental stage of *formal operations*. Klaus Reigel (1973) was the first to posit a stage beyond formal operations.[18] He referred to it as *dialectical operations*. Two years later, Patricia Arlin (1975a) posited *postformal operations* as a variant theory. The term *postformal* has been in use ever since and refers to a number of theoretical approaches which seek to either (a) posit another stage or stages, level or levels, or complexity attractor(s), in addition to those elucidated by Piaget; (b) problematise Piaget's theory but not developmentalism *per se*; or (c) problematise developmentalism as a whole.

Much of the discourse surrounding the term has been within developmental psychology, notably in the *positive adult development* research community. This has ranged from the mathematical representations of Michael Commons and Francis Richards' (1984, 2002) Model Of Hierarchical Complexity to the critical reflections of John Broughton (1984). Various modes of cognition or operations, types of thinking, qualities, features and/or characteristics have been identified in this discourse as, or pertaining to, *postformal*. These include: complexity, dialectics, creativity, imagination, construct-awareness, problem-finding, reflexivity, dimensionality of systems thinking, contextualisation, holism, openness, unitary consciousness, dialogic consciousness, and wisdom. (Arlin, 1975a, 1975b, 1976; Basseches, 1980, 1984a, 1984b, 1986, 2005; Benack, Basseches, & Swan, 1989; Benack & Basseches, 1989; Broughton, 1984; Commons & Richards, 1984, 2002; Cook-Greuter, 1990, 2000, 2002; Demetriou, 1985; Kegan, 1982, 1994; Kohlberg, 1984; Koplowitz, 1984, 1990; Kramer & Woodruff, 1986; Labouvie-Vief, 1990; Loevinger, 1976; Marchand, 2001; Pascual-Leone, 1984; Powell, 1980; Riegel,

---

[17] A fruitful discussion here—beyond the scope of this article—would concern details of the relationship between postformal and formal. Suffice to indicate a working proposal of *postformal* sublating (transcending-and-including) *formal*, so that the reasoning mode of *formal operations* is appropriately honoured. (It has facilitated production of this very article, for example, and should form a significant part of its potential evaluation, too!)

[18] Due regard should be given to the ecology of forerunners to Positive Adult Development research into postformal thought. Notable here is Roberto Assagioli's (1965/2000) *Psychosynthesis*, and Abraham Maslow's (1971) Self-Actualization Theory including his developmental *hierarchy of human needs.*

1973, 1975, 1976; Sinnott, 1998, 2003; Sternberg, 1998; Wade, 1996). The literature also demonstrates a wide variety of conceptualisations regarding the theoretic legitimacy, number, positioning and/or relationship among postformal developmental levels.[19]

The term *postformal* took on a somewhat different usage and meaning in 1993 within the field of education via Joe Kincheloe and Shirley Steinberg (1993) who posited a *socio*-cognitive theory regarding post-formal thinking, describing postformal thought as the socio-cognitive expression of postmodernism. In addition to features identified above with the developmental psychology discourse, they included: critical theory, genealogy, etymology, structuralism, metaphoric cognition, ecological thinking, deconstruction, nonlinearity, holistic causation, and power-awareness. This genealogical thread is still current in the educational literature and in significant ways provides a contrasting perspective to the developmental psychology discourse, although there is a small cross-over between the two fields (Hampson, in preparation).

Meanwhile, Wilber has been writing on postformal thought since 1977, notably in his 1995 *magnum opus—Sex, Ecology, Spirituality*—where he coined the neologism (analogous to postformal thought), *vision-logic*. Postformal thought forms a significant part of AQAL. Both *postformal* and *vision-logic* are used in integral studies discourse—see, for example, Meyerhoff (2006). Through referencing two other *magnum opa—The Life Divine*, by Sri Aurobindo (1914/1960), and Jean Gebser's (1949/1985) *The Ever-Present Origin*—AQAL brings together psychological and socio-cultural components (though in a different way to the education discourse) associating *formal* (as in *formal operations*) with the *modern* worldview, and *postformal* variously with *postmodern* and *integral* worldviews via a developmental and holonic framework described as *integral*.

Developing Postformal Thinking

There are clearly many modes of thinking indicated here and it is beyond the scope of this article to report or discuss the manifold possible interrelationships among these.[20] Yet to facilitate explicit enactments of thinking postformally, I posit that a deepening and a cohering of postformal qualities might be helpful. Both moves (deepening and cohering) can be seen to have affective (embodied) and mental (intellectual) aspects.

In terms of *deepening* postformal thinking—from an affective perspective, a relationship between self-sense and postformal concept could be developed through trust: an *opening up to* the postformal quality in question via affective embodiment (such as via intuition). The mental correlate of this would be to *open up* the postformal concept via the intellect.

For example, if we were to regard the postformal concept of dialectics, we might represent this procedure as:

> (Beginning to) thinking dialectically → engaging with literature on dialectics → thinking (more) dialectically

The generic heuristic algorithm would be:

---

[19] Although a discussion of these is beyond the scope of this article, my research does not readily support the regard of AQAL's particular developmental framing of postformal modes as an *orienting generalisation* of the whole literature, but rather supports the viewing of AQAL's framing as one (necessarily contestable) *type* of summarising perspective on it.

[20] Further elucidation is given in "Thinking postformally" (Hampson, in preparation)

Thinking *x*-ly (*n*) → engaging with literature on *x* → thinking *x*-ly (*n+1*)

The example regarding dialectics would thus connect the psychological construct, *dialectical operations*, with the philosophical construct (in its varying interpretations and contestations), *dialectics*.[21] A similar connection would be made between the identification of *complexity* as a construct complicit in psychological development, such as Commons and Richard's Model of Hierarchy of Complexity on the one hand, and *complexity theory*—representing the philosophical dimension—on the other. (In this way, such a relationship between psychological and philosophical constructs could be used in the concretisation of postformal educational theory). The general case can also be seen as hermeneutic circling.[22]

In terms of *cohering* postformal cognitive qualities—a similar framework could be helpful. Conceptual cohering could be facilitated through systematic consideration of the possible ecology of / dialogue among postformal features. A corresponding manoeuvre can be conceptualised with regard to the interpersonal domain, through such dialogic lifeworld practices as Bohmain dialogue and Gangadean's (2007) Deep Dialogue. (Such schemas could also be seen as useful for *intra*personal work).

The net effect of the above could be to better theorize the facilitation of embodying the central theme of this article: namely, to switch priorities from formally addressing postformal cognition (as an object of inquiry) to enacting *thinking postformally* (as a cognitive process of the inquiring or participating subject). Specifically, in relation to the postformal modes outlined in the following section, the following summaries could be given:

- *Deepening postformal thinking*: thinking creatively, reflexively and "embodiedly" about postformal cognition (dialectics, complexity, criticality, conceptual spacetime context)—regarding the object of inquiry (e.g., integral theory).
- *Cohering postformal thinking*: thinking ecologically (dialogically) about postformal cognition (dialectics, complexity, criticality, conceptual spacetime context)—regarding the object of inquiry (e.g., integral theory).

Applying Postformal Thinking

It can be readily seen that there would be many ways to enact postformal thinking. The types of postformal cognition I have selected for this article are related to, on the one hand, my knowledge of, and experience with, integral theory—notably, AQAL—and on the other hand, my research on postformal thought. It is intended to exemplify particular usage of postformal operations whilst facilitating a pertinent development of integral theory.

In terms of my research on postformal thought, I have included certain postformal items that feature strongly in the literature, and with which I have personally come into significant (and ongoing) relationship, namely: genealogy, conceptual ecology, dialectics, critical theory and complexity (see, notably, Basseches, 1984a, 2005; Commons & Richards, 2002; Cook-Greuter, 2000, 2002; Kincheloe & Steinberg, 1993; Riegel, 1973, 1976; Sinnott, 1998; Sternberg, 1998; Wilber, 1995). Each of these have large and varied terrains, and it is beyond the scope of this article to elucidate such domains in detail. Mention, however, will be given to the following three points as markers for more detailed research. Firstly, at least two uses of the term, genealogy, can be found within postmodern discourse: one in reference to complexity theory (see Davis, 2004), and the other in relation to Foucault (see Scheurich & McKenzie, 2005). In this article, I am employing the former. Secondly, substantively different interpretations of the term dialectics can be variously identified—in relation to, for example, the following five major threads: Socratic (inquiry dialectics), Hegelian (dialectical method), Marxist (dialectical materialism), Daoist (Taijitu dialectics) and Derridean (the dialectics of deconstruction). In this article, I am demonstrating an instance of the use of dialectical operations through calling upon an amalgam—a particular conceptual ecosystem—of the above threads. I am using the metaphor of ecosystem (a complex adaptive system) to facilitate the quality of dialectics in my conceptual operations—my participatory engagement with the object of inquiry (in this case, integral theory). Complex dialectics23 would thus seem a suitable signifier for this.[24]

---

[21] Also see Basseches (2005)

[22] *The hermeneutic circle* (as advanced by Schleiermacher) denotes the idea that the knowledge of the whole is to some extent already needed in order to understand the parts. A hermeneutic *helix* might perhaps be a better metaphor, as two conceptual dimensions are involved in the learning procedure: a *returning to origin* (represented by the circle of the helix—as viewed end-on) and an *advancement* (represented by the *linear*—if wavy—dimension of the helix, as viewed side-on).

In terms of integral theory, I have focused on particular issues that have not apparently been adequately addressed—notably, the following two concerns. Firstly, from a formal perspective—employing a Cartesian template based on formal Aristotelian logic—the theoretic basis of integral would most likely interpret the concepts of construction (or reconstruction) and deconstruction as adversaries. Whilst not denying the partial truth of such a perspective, dialectical operations can be used to realise finer distinctions. Secondly, formal/modern constructions of theory can be seen to be based on dualistic conceptual templates metaphorically derived from Aristotle, Euclid, Descartes and/or Newton, whilst postformal/postmodern theoretic constructions would be based on conceptual templates which sublate (transcend and include) the aforesaid formal ones (hence contestability over the relationship between theory and narrative from a formal perspective[25]).

---

[23] Numerous generative, transdisciplinary concepts are found within complexity theory (I am using the term broadly to encompass chaos theory). These include: emergence (and its relationship to, for example, bifurcation, creativity, nonlinearity, unintended consequences, the irreducibility of quality to simple "quantity," and the identification of "ontological" levels), hysterisis (time lag, internal complexity, historical memory), simple holarchies and entangled holarchies, first cover, sensitivity to initial conditions (the butterfly effect), recursion, indeterminacy (dimensions of intractability, etc.), openness (permeability of boundaries), attractors (e.g., point, curve, manifold, strange) adaptation, autopoiesis (self-organisation), and dynamism ("life" / life). The complexity quality I am foregrounding in this article is recursion (fractals, holography, holonomy).

[24] In relation to the five strands, one might say—at first blush—that: (a) it is an approach to Socrates-like inquiry (yet acknowledging both certain guidance and uncertain outcome); (b) it has the capability of being used as a Hegelian-like systematic method (yet where system is seen as complex rather than mechanical); (c) acknowledgment is given to dialectics identified in the material world (yet, again, where this is not held mechanically, but complexly; also where a complex dialectics is also identified *between* material and conceptual worlds); (d) acknowledgment is given to the spirituality, intuition, complex recursion, and interpenetrative dynamics of dialectics (yet avoiding the fundamentalisation of myth); and (e) the subtle dialectics of text is acknowledged (yet allowing for its enactment to be panoramic).

[25] E.g. the question, "is it a *real* theory?" and comment, "it's just a story" come from such an either/or perspective. Yet, that is not (necessarily) to say that what is left is an indistinguishable blurring: that conclusion would, too, come from an either/or perspective.

These two strands—namely, those aspects of postformal thinking that I am foregrounding, and those aspects of integral theory that I am foregrounding—result in the following sections in this article:

- Thinking Contextually about Integral Theory
    - Sharing Schelling: A Genealogy of Postmodernisms—reporting on a genealogy which links integral and postmodern philosophical tendencies via Schelling as bifurcation point;
    - An Ecology of Integrals—identifying a conceptual ecology of *integral* constituted by six genealogical threads, among which there are commonalities and contestabilities;
- Thinking Dialectically about Integral Theory
    - Deepening Vision-Logic—identifying dialectical operations in the concept of vision-logic, then developing this perspective;
    - Contra-Indications of *Construction*—exploring considerations which run counter to the formal default integral perspective regarding *(re)construction* and *deconstruction;*
- Thinking Critically about Integral Theory
    - Boomeritis: An (un)Critical Americanitis?—raising a question concerning the significance of cultural type—or marked national idiosyncrasy—in relation to postmodernism;
- Thinking Complexly about Integral Theory
    - Nanotextology (A Recursion of Content)—exploring a recursion of the theoretic component of "content" as related to (an interpretation of) a particular poststructuralist understanding of "style"; and
    - Holonomic Nonduality (A Dialectical Recursion)—exploring a recursion of *nonduality* (including the possible connection between this and a recursive dialectical template).

Thinking Contextually About Integral Theory

It's turtles all the way down (Wilber, 1995, p. 35).

Space and time—and metaphorical resonances of space and time—can be used as loci to extend theoretic contextualisations.

Temporalising of the past can be extended in a linear fashion (already evident in integral theory's apt consideration of pre-history, for example). Past times can also be more richly or adequately understood by adopting a genealogical approach (incorporating a bifurcating structure derived from non-Euclidean complexity theory). Possible futures[26] can also be extended in a linear fashion (surfacing the ethics of long-term thinking: due speculative consideration of medium-term, long-term, far and distant futures). And correspondingly, possible future time can be regarded genealogically via conceptualisations regarding the bifurcation of future scenarios. Present time can be conceptually extended through spatial metaphors, via, for instance, the postformal construct of conceptual ecology—a construct which not only enables the dialogical consciousness of holarchical conceptual space, but also local temporality and the metaphorical resonances of organicity and life.

---

[26] I draw attention here to the academic field of future studies. As excellent introductions, see, for example, Richard A. Slaughter (2005) and Sohail Inayatullah (2007).

In the first of two sections, a genealogy is described which philosophically links the integral quest and the postmodern quest as two complementary branches. In the second section, a conceptual ecology is identified which contextualises different interpretations of integral. A particular relationship is then chosen to exemplify a pertinent contestability: that between the integrals of Wilber and Gebser.

Sharing Schelling: A Genealogy of Postmodernisms

A starting place to view a less adversarial relationship between *integral* and *postmodern* than that connoted by Wilber and some members of the integral community, is to consider their shared genealogy. Philosopher Arran Gare (2002) has done just that. He presents the following picture: As scientific materialism began to increase in societal power in late 18th Century Europe, a "postmodern" countertradition arose in the footsteps of Giambattista Vico and Jean-Jacques Rousseau. Johann Herder led the way, identifying: suffering caused by abstractions; the need for self-realisation; an appreciation of cultural plurality; the importance of the particular, the sensory, the active; and a purposeful nature. This thread led—via Johann Wolfgang von Goethe—to Friedrich Wilhelm Joseph von Schelling. Like Rudolf Steiner, Wilber (1995), and Jennifer Gidley (in press), Gare identifies Schelling as an inspiration, and a pivot in history. He highlights Schelling's dialectical method and also his understanding of *that, that we are*: an "unprethinkable Being" which precedes all thought and is presupposed by it. Gare then identifies a historical bifurcation stemming from Schelling. One branch leads to the poststructuralists ("poststructuralist postmodernism"), the other to a high-order quest for coherence ("cosmological postmodernism").[27]

In addition to the dialectical nature of the philosophy that lies at the root of the two branches, the branches themselves can be seen as a dialectic between Schelling's *alignment* with Georg Wilhelm Friedrich Hegel on the one hand, and his *critique* of Hegel, on the other.

The branch that proceeds from Schelling's *critique* of Hegel includes Friedrich Wilhelm Neitzsche, Martin Heidegger, Michel Foucault (largely influenced by Neitzsche), Jacques Derrida (largely influenced by Heidegger) and Gilles Deleuze (who retains more influence from Schelling than the others). Somewhat resonant with Roland Benedikter's (2005) seminal work on postmodern spirituality, Gare proffers that, "poststructuralists require Schelling's earlier philosophy or developments of it to sustain their arguments" (Gare, 2002).

The branch which is more *aligned* to Hegel leads to Henri Bergson and Alfred North Whitehead via Charles Peirce and also via Karl Ernst Von Baer's evolutionary theory of nature. Gare identifies this thread as a high-order quest for coherence. Such a quest for coherence is surely central for any integral theory. But surely a greater integral quest would be to attempt to respectfully honour both branches? Although the branches may seem somewhat incommensurable from a formal perspective, a postformal perspective on *integral* might better facilitate such a quest. But what is *integral*? A postformal approach to answering that question might well address the conceptual ecology among different (connected and contested) uses and interpretations of the word.

---

[27] Consideration might be given here regarding the nature of the relationship between Gare's genealogy and Wilber's (1995) bifurcation of post-Enlightenment as "Ego" and "Eco."

An Ecology of Integrals[28]

Integral—meaning, "of or pertaining to a whole"—entered the English vocabulary from the Latin, *integer* (via the French, *intégral*) in 1471. In terms of integral theory and correspondent developments, Sri Aurobindo Ghose (1914/1960) used the term to describe a type of knowledge or yoga, as published in *The Life Divine*. Unaware of Aurobindo's usage, Jean Gebser (1949/1985, p. xxix) began using the term (as a conjunct to *aperspectival*) in 1940, culminating in its usage in *The Ever-Present Origin* in 1949.[29] Meanwhile, Haridas Chaudhuri carried the term through from Aurobindo and founded the California Institute of Integral Studies (C.I.I.S) (n.d.) in 1968. Michael Murphy also brought through Aurobindo's integral theory when he co-founded the Esalen Institute[30] (2005) in 1962. He has since adopted the term *integral* with George Leonard, in their *Integral Transformative Practice* (2007). The most popular(ist) integral theorist—Ken Wilber (1997, 2000a, 2000c)—had started using the term by 1997 to describe both his own writing,[31] and thence his institutional frameworks, such as the Integral Institute (2007) including Integral Naked.[32] Global-outreach tertiary institute, Pacific Integral (n.d.), was founded in reference to this genealogical branch, as well as to William Torbert's work.[33] Wilber's genealogical branch entered futures studies via Richard Slaughter (1998). Ervin László (2004) started foregrounding the term in relation to integral science in 2003, competitively using with the same turn of phrase as Wilber—An Integral *Theory of Everything*—in 2004. Global philosopher Ashok Gangadean (2006a) incorporates László's work among others, to form his own dialogical integral approach. Gidley acknowledges Gangadean as part of her quest to "integrate the integrals," notably an exploration of connections between Gebser, Wilber and Rudolf Steiner, the latter of whom she identifies as an integral pioneer (Gidley & Hampson, 2005). Meanwhile, others have furthered representations of C.I.I.S.'s mission, including Robert McDermott, Richard Tarnas (see, for example, 1991), and Jorge Ferrer, the latter of whom has identified a *participatory* integral approach along with Marina Romero and Ramon Albareda (Ferrer et al., 2005), directors of Estel, a centre for personal growth and integral studies in Barcelona (Albareda, n.d.). In addition, William Irwin Thompson (2003)—whilst acknowledging Aurobindo and Steiner—has, for some decades, been running with Gebser's interpretation to foreground a certain artistry: integral *performances* that seek to generate new horizons; such alignment with creativity parallels both Bernie Neville's (1989) Gebserian and archetypal educational approach, and, substantively, Alfonso Montuori's (1997) interpretation of *integral* as a form of disciplined *improvisation*, via the generative metaphor of jazz.[34]

---

[28] As *integral* can be contextualised within "an ecology of integrals," so *an ecology of integrals* can itself be contextualized within "an ecology of related terms."

[29] Alan Combs (2005) comments that it remains unclear as to the degree of influence Aurobindo had on Gebser, remarking, "the whole affaire of Eastern influences in Gebser's thought would be an excellent topic for an investigation" (§ *The Inner and The Outer*, ¶ 8).

[30] Beck and Cowan (1996) address Esalen as Green vMeme.

[31] The original edition of Sex, Ecology, Spirituality (1995) does not have an entry for "integral" or "integral …" in its 33-page index, whilst the second edition (1995/2000) does.

[32] To date, the nascent Integral University (2007) has not yet emerged.

[33] Also see below regarding Cook-Greuter's ego developmental model.

From this particular ecological perspective,[35] there are six intertwined genealogical branches of *integral*: those aligned with Aurobindo, Gebser, Wilber, Gangadean, László and Steiner (in respective chronological order of first usage[36]), among which there are varying degrees of commonality and contestation in various dimensions.[37] As such, we may regard the above as an outline of some "semiotic attractors" within a (necessarily complex and dynamic) hermeneutic ecosystem.[38]

Picking up one such inter-branch contestation, let's turn to the relationship between the *integrals* of Wilber and Gebser. Thompson (1996) foregrounds a difference between the two in relation to Gebser's "grand" European sensibility and loving attention to detail. Bonnitta Roy

---

[34] Further—in addition to the integrally-oriented *ReVision* (co-founded by Wilber)—there has recently been an upsurge in integral journals—including *Kosmos* (2001), *The Journal of Conscious Evolution* (2005), *Integral Review* (2005), and *AQAL* (2006); there has also been the Gebser Society's *Integrative Explorations Journal* (currently not in print).

[35] Different perspectives are, of course, possible. For instance, although he doesn't mention Gebser or Steiner, Daniel Gustav Anderson (2006) gives an alternate perspective that, "integral theory…remains Aurobindian from tip to toe inclusive of thinkers as diverse as Wilber and Thompson" (p. 63, n. 3). This can be seen to signify an ecology stemming from one root. Other perspectives might dispute inclusion and/or exclusion of various branches for various reasons (see following footnote, for example). Furthermore, I am not claiming this sketch is comprehensive, but rather, a reasonable point of departure. Every framework inevitably comes with a bias, and I apologise to any authors who may feel underrepresented by identifying / constructing this particular genealogy.

[36] Noting that the Steiner branch is via the conduit of Gidley.

[37] Most contestations occur in relation to Wilber's genealogical branch. Possible causes for this include (a) the power base of each branch (see Appendix C), and (b) Wilber's competitiveness over the term, *integral*. For example, the website for Wilber's Integral University (2007) advertises itself with the tagline, "the world's first integral learning community." Apart from the tense-related misnomer regarding the fact that it is not yet in operation, such a claim has the quality of being decidedly competitive with regard to the term, *integral*, in relation to the ecology of interpretative uses of the term as described in this article. Specifically, Sri Aurobindo's thread was established first, Gebser's second and Wilber's third. C.I.I.S was founded in relation to Sri Aurobindo's *integral* (and this relationship has been in continual—if varying—reference to this thread ever since (Wexler, 2005). It would also be difficult not to interpret C.I.I.S., at least in part, as a "learning community." In this way, it could readily be argued that C.I.I.S. was the world's first integral learning community. Two questions arise here: (a) In what specific ways has Wilber (or The Integral University) honoured this understanding concerning C.I.I.S.'s Aurobindian—and thus integral—heritage? and, (b) Given the central utilisation of Aurobindo by AQAL, in what specific ways has Wilber (or The Integral University) detailed a differentiation between C.I.I.S.'s interpretive use of Aurobindo and his own interpretive use of Aurobindo to the extent that he can justify unilateral interpretative usage of the term, *integral*, in the manner described here? Also—although associated primarily with Wilber's integral thread with regard to interpretive usage of *integral*—a further question could be asked with regard to the already-existent integral learning community at Pacific Integral: namely, Would they regard themselves *primarily* as being part of Integral University's learning community to the extent that I.U.'s claim is understood as congruent with their own sense of identity? Such are some of the power relations (AQAL lower right quadrant identifications) regarding the term or meme, *integral*. For further discussion on the current status of *integral*, I would recommend Cowan and Todorovic (2006).

[38] I note that, through publication of this article, I myself am participating in this ecosystem.

(2006a) adds to this line of reasoning. She makes the point that codification / categorisation, such as is dominant in AQAL, is a *mental-perspectival* (rational / formal) operation, and that we need to move beyond this into thinking, experiencing, and expressing in *aperspectival* (integral) ways:

> Jean Gebser points out a critical distinction between the Rational Level tendency to codify perspectives, that is to arrange any number of perspectives according to their relations in systematic terms (aka, making maps) and the Integral Level which goes beyond the mapping of perspectives, beyond even the making of perspectives, into thinking and experiencing in *a-perspectival* ways (p. 28).

Yet, reminiscent of Wilber's *transcend-and-include*, such "going beyond" still has to *include* the mental-perspectival structure of consciousness. But such inclusion can only take place when the structure—Rationality, in this case—has been mastered and given its rightful place, no more, no less—as Gebser (1949/1985) elucidates: "The various structures [of consciousness] which constitute [us] must…become *transparent* and conscious to [us]" (p. 99) and that we need to,

> master the deficient components by [our] insight so that [we] acquire the degree of maturity and equilibrium necessary for any concretion. Only those components that are in this way themselves balanced, matured, and mastered concretions can effect an integration (p. 99).

Notably here, in order to "effect an integration," Gebser refers to three necessary qualities in regard to the other structures of consciousness (such as the mental/rational structure), namely: insight, maturity and balance. I posit that each of these can be fruitfully regarded as conceptual portals (linking philosophical and psychological dimensions) which can facilitate integral modes of engagement—thus linking Gebser's integral theory with Ferrer et al.'s participatory integral theory mentioned above. Moreover, insight, maturity and balance point to (or, perhaps, can be encapsulated as) the *art* of integrality. As Roy indicates, integration needs to be well-crafted: it needs to be artful; artful with a capital *A*.

A question regarding the art of crafting—or the craftiness of artistic licence, perhaps—arises when Wilber's mapping of Gebser's structures of consciousness is addressed, specifically in relation to the detail of the liminal territory between the modern/mental/rational structure and the integral one—the general area constituted by Wilber's (2006b) Orange, Green, and Teal (a.k.a. Yellow) vMemes,[39] "waves" or levels. This conceptual terrain is critical in that it potentially constitutes the transition between where we are now—the modern/rational/formal world(view)[40]—and where we (presumably) want to go—namely, the integral world(view); and so it behoves me, as an explorer of this terrain to describe the following. When Wilber refers to Gebser's model, he often correctly identifies Gebser's structures of consciousnes. However, at other times, especially when he refers to Gebser in a context of other authors, and also notably in his more recent work, his text and charts are often substantively misleading[41] (if one wishes to explore the particular territory rather than operate at the level of "orienting generalisations"[42]). Consider the following indicative statement:

---

[39] After Beck and Cowan parted company, Beck and Wilber developed Spiral Dynamics Integral for several years. Wilber's reference to the "yellow meme" dates back to this period—a period Wilber refers to as "Wilber IV" (see Kazlev, 2007). After Beck and Wilber parted company, Wilber adopted his own coloured developmental level system based on the rainbow spectrum (thus negating the interwoven, DNA-like, Caduceus-like helix of cool and warm colours—the *spiral* in Spiral Dynamics—and instead established a *straight* rainbow-based topology). In this, some colours have stayed the same (e.g., Orange and Green); others have changed (e.g., Yellow has become Teal).

[40] Of course, as Wilber (2000c) clearly indicates, *where we are now* is a very complex territory comprising the entire spectrum of socio-cultural developmental levels, variously manifesting across the globe. For instance, he places 40% of "the population" at the mythic level (having 30% of the power), and

> Jean Gebser [amongst others]…believe[s] that the general waves of evolution or unfoldment have included **archaic**, **magic**-tribal, **mythic**-traditional, **modern**-rational, **postmodern**-pluralistic—all of which together are often called "first-tier" waves—and **integral**-aperspectival—which is often called "second tier" (Wilber, 2006a, p. 5, emphasis in original).[43]

This statement is incorrect. Gebser has *not* posited a postmodern-pluralistic stage. Unfortunately, Wilber reinforces this error in various charts and tables frequently propagated at face value by a significant proportion of the integral community. In an iconically glossy insert in Integral Spirituality (Wilber, 2006b, between pp. 68-69) for example, he identifies Gebser's "pluralistic" stage as corresponding with the Wilberian Green vMeme. In an exacerbation of the situation, he also associates Gebser with a "super-integral" developmental level. Such errors also occur in the *Wilber-Combs Lattice*, a key feature in Wilber's latest work (2006b, p. 90). Gebser only elucidated five structures: archaic, magic, mythic, mental and integral. No postmodern pluralism, no "super" marked-up[44] integral. Gebser's understanding instead is that the integral

---

30% of "the population" at rational-formal (with 50% of the power) (pp. 9-10). Unfortunately, he does not specify what geographical territory is constituted by "the population," nor does he specify how these figures were derived.

[41] This is a view shared by Matthew Dallman (2006), once art director for Wilber's Integral Institute and researcher into *the archetype of integral*. From evidence in the integral community's *blogosphere* and elsewhere, he is concerned about "the growth of superficial thinking about matters of the world. Contexts are smashed together and collapsed. Entire fields of thought are skimmed over" (Part III: Absurdities & Superficialities, ¶ 12). Evoking postformal languaging as identified by developmental psychologist, Susanne Cook-Greuter, he says that "worldview" understanding requires cognitive depth and *nuance*; "in Gebser, worldviews are poetic, not scientific" (Dallman, 2006, Part III: Absurdities & Superficialities, ¶ 12).

[42] This is the neologistic term given by Wilber (1995, pp. viii-ix) to refer to his "broad brush stroke" theoretical approach.

[43] The use of the phrase, "often called," is disingenuous in that (a) the terms were coined by Beck and Cowan, yet Wilber but does refer to Beck and Cowan in this text as part of his list of "leading theorists of consciousness evolution." Indeed, there has been a substantive change from Wilber IV—e.g., (Wilber, 2000c)—to Wilber V—e.g., (Wilber, 2006b)—with regard to Beck and Cowan and their Spiral Dynamics in that, for example, AQAL no longer identifies developmental levels via the coloured vMemes of Spiral Dynamics; (b) Other than Spiral Dynamics, the only substantive referential point of the use of these terms is Wilber himself. But on what empirical research is Wilber now using these terms if he is distancing himself from the research of Spiral Dynamics? Alternatively, what legitimate justification might he have for disavowing Spiral Dynamics with regard to their research on vMemes yet still utilise that part of their research which distinguishes between two genera of vMemes?

[44] Or super-marketed! (see below for discussion concerning Wilber and the Orange vMeme)

structure follows on, as it were, *directly* from the mental-perspectival (modern) one[45] and that it has various unique attributes or characteristics which infer a "translucence" of—a certain (re)opening up to—*previous* structures rather than the theoretic construction of *further* stages beyond integral. (See Appendix A for further discussion).

An associated contestation between the genealogical branches of Gebser and Wilber's *integrals* concerns the following. As noted above, Wilber often associates Gebser's *integral* with his *vision-logic*, and he elsewhere differentiates *vision-logic* between *early* (relativist) and *later* (dialectical/integral)[46]—a differentiation which has been identified in developmental psychological research, which Wilber references (2000a, pp. 21-22). Such research, however, does not carry a sufficiently unified voice for a call of "orienting generalization" to be legitimately made. There are substantive contestabilities. Piagetian commentator, Helena Marchand (2001), for instance, concludes from her review of the literature,

> The great diversity of theories, and of methodologies … presented by authors who postulate the existence of stages of development beyond the formal operations stage makes it difficult, if not impossible, to get a unified view of the characteristics of this level of thought (¶ 11).

She also cites Labouvie-Vief (1992), for instance, as presenting an alternate theoretic topology of postformal cognition: "The term postformal may not imply a progression in formal complexity. Instead, it could mean that for some individuals, formal thinking forms a base from which thought branches out into more nonformal domains" (1992, p. 221, cited in Marchand, 2001, § *What is the nature of postformal thought?* ¶ 6). Nevertheless, a significant theoretical thread shared by other researchers can indeed be characterised as a transition from relativist to dialectical stages, and it would indeed seem that there is validity in such identification. However, from a postformal point of view rather than an either/or one, this theoretic identification may represent only a partial perspective: this *relativist→dialectical* construction is not an understanding shared by all researchers on postformal thought and *may* form part of a greater understanding rather than be necessarily—or prematurely—put into a competitive conceptual arena. My research of the current state of play indicates that, collectively-speaking, postformal terrain is still (stimulatingly) work-in-progress (Hampson, in preparation).

However, even if we disregard such contestability, Gebser still cannot be legitimately used in this manner to support such a distinction in the socio-cultural (particularly lower left) AQAL quadrants regarding the status of postmodernism. As conversational openings, I see a number of options here. Either, (a) a convincingly detailed in-depth hermeneutic needs to be conducted between Gebser's integral-aperspectival and Wilber's theorizing of socio-cultural stages—this might involve, for instance, either (i) attempting to tease out a distinction between Green and Yellow (Teal) vMemes within Gebser's integral-aperspectival structure, and/or (ii) attempting to tease out a distinction between Orange and Green vMemes within Gebser's mental-rational structure; (b) an appropriate refinement of AQAL holon theory needs to occur, perhaps involving (i) identifying a relationship between Gebser's understanding of *deficiency* and *unbridled relativism*, for example (although there would be substantive implications for the linear orderliness of Wilberian level identification here), or (ii) taking heed of Susanne Cook-Geuter's, Stanislav Grof's or Jenny Wade's comments (outlined below) concerning the radical reflexivity arising from postconventional/integral development; (c) evidencing for this socio-cultural transition should no longer include Gebser but instead should newly establish this territory via other substantive reference (if such a reference were to be found); (d) Wilber's conceptualization concerning the Green/Teal relationship should be abandoned; (e) a substantively pertinent critique should be given of my analysis; or (f) a "craftful" combination of the above! If (d) is identified, an alternative Wilberian concept, *vision-logic*, could be fruitfully used and developed. Such development could use dialectical operations—a postformal mode of reasoning that has even wider implications for integral theory than the deepening of vision-logic. It is this postformal perspective I will now address.

---

[45] Via a complex process of decreasing "efficiency" in this structure as it overextends or intensifies via over-quantification—the ratio in rational leading to an undue rationing of consciousness—see, for example, (Gebser, 1949/1985, p. 95)

[46] With confusing contradiction, Wilber states, "I use 'postformal' both ways (as the first major stage beyond formop—namely, vision-logic, and as all levels beyond formop), as context will tell" (Wilber, 2000a, p. 224, n. 14). In this statement, he denotes vision-logic solely with the Green vMeme and implies that vision-logic does not refer to subsequent vMemes, such as his "post-pluralistsic" integral.

Thinking Dialectically About Integral Theory

Dialectical operations[47] can be used to both deepen and problematise integral theory. The former can be achieved via the concept of vision-logic and the interpenetrative play of the visionary logic embedded within the term; whilst the latter can be achieved through counterpointing the default (conventional / formal, non-dialectical) view of the concept of construction with a dialectical view regarding the concept of deconstruction.

Deepening Vision-Logic

In contrast to Wilberian conceptualisations concerning the sharpness of distinction between postmodernism (as Wilberian Green vMeme) and integral (as Teal and beyond), *vision-logic* straddles the Wilberian postmodern/integral divide (2000a). Wilber comments that "signs of the emergence of vision-logic" would be constituted by "movements that would be 'postrational' or 'poststructural' or 'postmodern' in the best sense" (1995/2000, pp. 195-196). The term brings together developmental psychology research on postformal, postconventional (but pre-transpersonal) thought with corresponding socio-cultural perspectives, thus covering both individual (upper quadrants) and collective (lower quadrants) aspects of one holon.[48]

Vision-logic is a neat term (in both senses) as it creatively embraces a number of postformal features simultaneously, evoking a "magic synthesis" (Wilber, 2000a, p. 259, n. 27). Gidley (2006) indicates that academic research often privileges *logic* over imaginative *vision* and consequently does not achieve such a "psychoactive" outcome. It's perhaps also a quintessentially postformal term in that it is a neologism constituted by a dialectic between two contrasting formal concepts—*vision* and *logic*. It is thus variously analogous to William Stern's

---

[47] Wilber (2000a, p. 22) indicates that dialectics itself is an important characteristic of postformal thought. This view is supported by Helena Marchand (2001) who concludes that, "the dialectical and the relativist models stand out, because of the influence they exert on the bulk of the conceptualisations of postformal thought." Benack and Basseches (1989), in line with Susanne Cook-Greuter (2002), Wilber and others, identify dialectical thinking as more advanced than relativist thinking.

[48] For Wilber's interpretation of holon theory, see Wilber (1995).

(1938) *unitas multiplex*, Benedikter's (2005) *productive void*, Goethe's *delicate empiricism* (Seamon, 1998), Foucault's (2003) *epistemologico-political*, Dewey's (1919/2004) *end-in-view*, Bussey's (2006) *critical spirituality*, Gangadean's (1993) *meditative reason*, Steiner's (1910/1983) *spiritual science*, and also, perhaps—in more condensed or expanded forms—to Derrida's *différance* (as dialectic between *difference* and *deference)*, Gebser's (1949/1985) *integral-aperspectival*, Hafiz's *God in drag* (1999) and Zhuangzi's (n.d.) *Transformation of Things* (as exemplified by Zhuangzi's dialectical narrative regarding a person's dream that they were a butterfly, in question with an alternate understanding that the butterfly was dreaming the person). The term is inherently "unstable" from a formal perspective, but paradoxically generative and vitalising from a *post*formal perspective in that it can facilitate a spark of cognitive transformation in the reader if the context of the reader is such that the concept is sufficiently *trusted* and given space to internally reside, so to speak. Regarding the *logic* of "cognition" and the *vision* of "integration," Wilber (2000a) refers to various researchers on postformal thought:

> Commons and Richards, Fischer, and Sinnott tend to emphasise the cognitive component of vision-logic (and often its extreme developments), while Basseches, Pascual-Leone, Labouvie-Vief, and Deirdre Kramer highlight more of its dialectical, visionary, integrative capacities. Arieti stressed that vision-logic is an integration of primary and secondary processes—fantasy and logic—and thus it can be very creative (p. 259, n. 27).

In addition to the overall dialectic of the term, Wilber interestingly attributes dialectical thinking itself as belonging to one side of the term—the *vision* side. A complementary understanding would be that dialectics is a type of postformal logic and can therefore be found in the *logic* side of the term: such is the imaginative generativity of the term.

Wilber (2000a) says that "vision-logic can be applied (as can most cognition) to any of the major *levels* (or realms) in any of the quadrants" (p. 261, n. 27). Applying vision-logic as a postformal lens upon itself (through visionary-rational extension), the following possibilities open up:

Vision variously connotes, among other things,

- Seeing as understanding
- Visionary futures-thinking
- Both the sharp focused detail of *central* vision, and the wide-angle, panoramic—"big picture"—soft focus of *peripheral* vision
- Spatial literacy
- Art
- Sensory-perceptual phenomena
- The differentiation of qualities
- Imagination

whist connotations of *logic* variously include,

- Rationality
- Reason, explanation
- Correctness, rectitude, right

- Logos, The Word, words
- Decision-making
- Pattern, form
- Formalism, formality
- Mathematics: the "play" of quantities

Additionally, from a more linguistically-oriented or creative postmodern angle, a characterisation might be to assign *logic* the role of Wilberian horizontal *translation*, the "flatland" of the *plan* view of ex-*plan*-ation; and, conversely, *vision* the role of Wilberian vertical transformation by means of identifying the (Erotic[49]) creativity inherent in the *image* of *imag*-ination (see Wilber, 1995, pp. 59-61). From this perspective, the neologism is metaphorically holonic which adds to its generativity. Meanwhile, from a dialectically-oriented mode of cognition, vision-logic can deepen into a plurality of vision-logics (a plurality still encompassed by the term as *genus).* This could include such domains as:

- Visions and versions of different logics—including:
  - many-valued logics (Malinowski, 1993), including
    - fuzzy logic (Novák, 1989; Zadeh, Klir, & Yuan, 1996),[50] and the related: fuzziology & social fuzziology (Dimitrov & Hodge, 2002), and vagueness (Williamson, 1994)
  - dialectical logic (Adorno, 1990; Ilyenkov, 1977);
- The logic of different visions—the rectitude of plural imaginations[51]—including
  - (post)modern imaginations (Kearney, 1998)
  - the embodied imagination (Johnson, 1992)
  - the theoretic imagination (Weick, 1989)
  - the scientific imagination (Holton, 1998)
  - the geometrical imagination (Hilbert & Cohn-Vossen, 1952)
  - the sociological imagination (Mills, 1959/2000)
  - the philosophy of imagination (Warnock, 1976)

In summary, beautifully situated in the liminal world of a generative, postformal flux gestured by a postmodern-integral dialectic, Wilber's vision-logic is an inspiring neologism which can facilitate cognitive transformation. The above demonstration of such a constructive facilitation—the production of a higher order of (integral) construction (or an intensification of resonance)—has, however, involved a certain (postmodern) deconstruction of the term. The demonstration above can therefore be seen to exemplify possible interpenetrative dialectics between construction and deconstruction.

---

[49] Referring to Wilber's AQAL placement of Eros as Creative force of the Kosmos (1995, p. 69; also see pp. 338-341).

[50] In a somewhat reflexive move, I note that fuzzy logic—and thence (holonic) fuzziology (Dimitrov & Hodge, 2002)—could be useful for facilitating the justification of Wilber's linguistic construct, *orienting generalizations* and other such "big picture" languaging inventions.

[51] The correctness of realising imaginations as valuable—inspired by, for instance, the transdisciplinary imagination (Gidley, 2001)

Contra-Indications of Construction

From a postformal viewpoint, *construction* and *deconstruction* can dialectically interpenetrate each other in various ways. To explore this perspective, a *formal* or *conventional* view of the terms—that construction involves a putting together, and that deconstruction involves a taking apart—are taken as given and not further explored. Instead, this section explores contra-possibilities or counter-intuitions.[52]

When we regard the terms, *construction*, *reconstruction* and *deconstruction*, what form of cognition are we using? From a pre-formal perspective we might feel a flood of emotive mythic resonances so that we conflate *construction* and *reconstruction* with *salvation,* and *deconstruction* with *destruction*. From a formal perspective, we might seek to carefully define exactly what the terms "actually" mean so that there is maximal differentiation; from the formal perspective, preformal conflations no longer apply, but *construction* and *reconstruction* still each stand in unequivocal semantic opposition to *deconstruction*. From a post-formal perspective, however, the situation may not (necessarily) be as clear-cut. A deeper understanding would beckon—one potentially calling upon any number of, or combination of, postformal approaches, epistemologies, ways of thinking and modes of expression, chosen (or happened on) by us to form a (non-relativist) "integrality." Such postformal modes of reasoning include thinking complexly, creatively, reflexively, dialogically, ecologically, "embodiedly," "constructivistically," and dialectically. In the following discussion, dialectics is used as an overall structure, whilst attention is given to the constructed nature of language. A transcendence of a simplistic / formal / Orange perspective on *deconstruction* and *(re)construction* is thus effected. In so doing, particular texts from Wilber and Derrida—chosen for their contra-indicative properties—are developmentally assessed to problematise the premise that Wilber's *(re)constructive* approach is necessarily operating at a more mature developmental level than Derrida's *deconstructive* approach. Firstly, an example is given indicating inappropriate destruction in the guise of reconstruction, as text from Wilber is analysed. Secondly, the constructiveness of deconstruction is demonstrated, as text from Derrida is analysed.[53]

---

[52] A metaphor here would be to consider the harmonics of a musical tone: *formal* semantic qualities could be understood as the fundamental frequency of the note, whilst the *postformal* dialectical semantics could be viewed as the harmonic overtones. Lest such a metaphor be consequently taken to necessarily signify the superfluity of dialectical semantics with regard to overall "pitch of meaning" (as it were), due regard should be given to the possibility of substantive *change* of "pitch of meaning" caused by particular intensifications of "postformal timbre"—as would be exemplified by the pitch of a note on a wind instrument reaching a bifurcation point and suddenly changing by an octave—through the practice of "overblowing." Another example would be feedback from an electric guitar. Perhaps analogous to an intensification of yin leading to sudden yang (or *vice versa*), the subtler characteristics of phenomena such as musical timbre or dialectical semantics should not be assumed to lack substantive power: *details* regarding integral theory have the potential not only to join up the dots, but also to create qualitatively novel surprises with regard to what *emerges* once the dots are joined up.

[53] The postformal approach I am employing is non-relativist in that substantive qualitative distinctions are made.

Destructive Reconstruction

Wilber uses the term *deconstructive postmodernism*54 and strongly associates it with AQAL's Green vMeme—described by Wilber as the green "meme," "level," "stage" or "wave," alongside the similarly strong associations of *pluralism* and *relativism*.55 Wilber (2000a) confidently asserts that,

> the bright promise of a constructive postmodernity slid into a nihilistic deconstructive postmodernity when the pluralistic embrace turned into a rancid levelling of all qualitative distinctions. Postmodernity, attempting to escape flatland, often became its most vulgar champion (p. 160).

In this vignette, *constructive* is the hero, one associated with bright, hopeful promise; whilst *deconstructive* is the villain, associated with nihilism, rancidity and vulgarity. On the "vulgar" side of postmodernity, he identifies two features: denial of depth and denial of qualitative distinctions. He evidences this via sole reference to two American novels: Ellis' *American Psycho* and Gass's *The Tunnel*—he presents no evidence from non-fictional sources and no evidence from the viewpoint of other nations. He goes on to say that,

> *Constructive postmodernism*…takes up the multiple contexts freed by pluralism, and then goes one step further and weaves them together into mutually interrelated networks. (…By whatever name, pluralistic relativism gives way to integral holism. See especially…Deirdre Kramer, Gisela Labouvie-Vief, Jan Sinnott, Don Beck, Clare Graves, Susanne Cook-Greuter, Kitchener and King, Blanchard-Fields, William Perry, and Cheryl Armon, among others) (2000a, p. 172).[56]

This "one step further" infers the holarchy (or non-dominatory hierarchy) of Wilberian theory, AQAL (1995, pp. 32-78), where constructive postmodernism is the next holarchical level after deconstructive postmodernism. But to what, exactly, is Wilber referring, when he uses the term, *deconstructive postmodernism*? Is he perhaps denying the possibility of *depth* in deconstruction? Is he "denying a qualitative distinction" between *deconstruction* and *deconstructive postmodernism*?

To answer such questions, one might perhaps imagine that Wilber's volume entitled, *A Theory of Everything* (2000c), would hold sufficiently adequate keys. In this, he associates the Green vMeme, *inter alia,* with Derrida,[57] deconstruction,[58] relativism, and the narcissism of—

---

[54] I will be not necessarily inferring the absolute lack of utility of the term, *deconstructive postmodernism*; I will rather be problematising its uncontextualised or unreflexive usage, and in so doing, attempt to raise pertinent awareness.

[55] Spiral Dynamics does not map *Derrida, deconstruction, poststructuralism, postmodernism, nihilism,* or *pluralism* or *relativism* (Beck & Cowan, 1996) in (or gravitating toward) the Green (or any other) vMeme. Therefore Wilber's theoretic use of the Gravesian terms, *first* and *second tier,* cannot legitimately be used in AQAL (e.g., Wilber, 2006b, p. 90) to make connective inferences regarding pluralism, postmodernism, deconstruction, etc.

[56] The current article variously refers to most of the authors Wilber mentions here.

[57] This placement of Derrida (published in 2000) would seem to contradict an earlier discussion of Derrida by Wilber, in Sex Ecology Spirituality (1995, p. 601). This is a discussion, I further note, left

and regression in—"boomeritis." Connecting *deconstruction* with *boomeritis*, we can observe the following—potentially revolutionary but unfortunately unsubstantiated—cultural criticism of this developmental level—the Wilberian Green vMeme:

> In green's admirable attempt to go *postconventional*—it has often inadvertently embraced anything nonconventional, and this includes much that is frankly *preconventional*, regressive, and narcissistic.
>
> This strange mixture of very high postconventional memes with preconventional narcissistic memes is boomeritis. A typical result is that the sensitive self, honestly trying to help, excitedly exaggerates its own significance. It will possess the new paradigm, which heralds the greatest transformation in the history of the world; it will completely revolutionize society as we know it; it will revision everything that came before it; it will save the planet and save Gaia[59] and save the Goddess; it will be the most extraordinary. …
>
> Well, and off we go on some of the negative aspects of the last three decades of boomer cultural studies. … Boomeritis has significantly tilted and prejudiced academic studies; it is behind much of the culture wars; it haunts almost every corner of the New Age; it drives many of the games of deconstruction and identity politics; it authors new paradigms daily (p. 27).

What should be made of such heroic words which caution us against war, haunting, and games of deconstruction? A call, it would seem, for boomers to turn from The Dark Side and acquire Wilber's Brave New Paradigm. Yet in such an admirable attempt to "go *integral*," certain shadow questions arise: Has Wilber unwittingly embraced the preconventional

---

unrevised for the second edition of SES (2000). Here, Wilber says that, "Derrida is often called on to support the notion that there are no transcendental signifieds at all (only sliding chains of signifiers and endless cultural mediation). But this is a misreading of Derrida. …According to Derrida, the fact that we *can* translate languages to some significant degree means that there are genuine transcendental signifieds … even if all contexts are situated, a great number of contexts are *similarly situated* across cultures. 'Context' does not automatically mean 'relative' or 'incommensurable.' *It often means 'common'…*" (1995, pp. 601-602) In this, Wilber appears to infer that Derrida should *not* be mapped as a "relativist." Wilber does not say in this discussion where Derrida *should* then be located. I have not found a reference where this apparent discrepancy is clarified. Notwithstanding discussion concerning the possible (though apparently unreflexive) postformal embrace of such a paradoxical position, this article will follow the particular subjectivity in Wilber that voices Derrida *as* a relativist, for these reasons: (a) this particular voice or stance of Wilber's appears to be later thinking; (b) it is expressed in the more populist of the two books; (c) it is voiced near the beginning in the main body of text rather than as an endnote.

[58] I have not come across a discussion by Wilber differentiating "Derrida" from "deconstruction" in terms of AQAL mapping.

[59] Interestingly, Beck and Cowan (1996, p. 47) attribute James Lovelock's '*Gaia* hypothesis' to the Turquoise (highest level, second-tier) vMeme—two levels beyond Green. They also identify "Gandhi's ideas of *pluralistic* harmony," "theories of David Bohn [sic]" (see discussion below) and Wilber's *Spectrum of Consciousness* each to Turquoise. (There is no reference to any other Wilber in this regard). The latter is an interesting choice given Wilber's self-distancing from this work, coming as it does from the historical subjective identity he labels, *Wilber I (the Romantic)* (Kazlev, 2007). An implication here would be that Beck and Cowan might have a different theoretical perspective on what Wilber calls "Eco" or "Romantic," and on "pluralistic harmony" and Bohmian theory, and instead attribute such qualities or approaches to the highest evaluation.

languaging of *cowboys and indians*?[60] In what way is Wilber *not* claiming that AQAL will "revision everything that came before it"? and: In what way would the incongruence potentially identified here *not* significantly "tilt and prejudice" integral studies? Then again, perhaps this is not the most important part of the story. Regardless, an emotively stirring scene has been set regarding the paramount significance of what needs to transform: the Wilberian Green vMeme with its "games of deconstruction."[61]

Before such judgements are made, however, perhaps due regard should be given to empirical research concerning attitudes toward the Green vMeme. Natasha Todorovic's (2002)62 careful research into relationships among the Spiral Dynamics vMemes unequivocally concludes that, "it is those with high Orange scores who reject Green most strongly," (p. 3) whilst, "yellow accepts green more than any other system" (p. 3). A conversational opening here, then, might involve an assessment of the developmental value of the integral discourse—exemplified above—can be most adequately be seen to align with. It is worth noting the possibility of "vMeme colonisation." (See Appendix A for further discussion).

Such shadow-work would benefit us all, no doubt. In this regard, what is, might or should be the relationship between integral theory, shadow-work, dialectics and deconstruction? For that matter, *qu'est-ce que la déconstruction*?

Constructive Deconstruction

From a vernacular perspective, deconstruction63 and Derrida go together like two peas in a proverbial pod. To adopt something of a semi-formal approach as mentored by Wilber (Murray, 2006),[64] we might, in addition, also want to turn to that semi-formal of media, the Wikipedia, to get an ordinary-yet-informed perspective on the term.[65] Wikipedia's entry regarding

---

[60] If such languaging can be theorized as part of a grand Magician's art—the art of the Spiral (Dynamics) Wizard (able to call upon all vMemes), then why is the teaching of this art not enabled through patient and demonstratively reflexive visibility?

[61] Perhaps *this* is such a game? Am *I* authoring a "new paradigm"? Phone 012-3π45-6789 for *YES* and 987-654π-3210 for *NO*. (N.B. "Extreme Postmodernists" can phone whatever number they like! whilst Reasonable Postmodernists can phone whatever number they like…*within reason*.)

[62] The referenced link (Todorovic 2002) requires a simple membership procedure. For access, follow: http://www.spiraldynamics.org/ → Articles → Advanced Resources → (registration) → "The Mean Green Hypothesis: Fact or Fiction?"Memes and vMemes in SD - the confused language of Spiral Dynamics"

[63] My interest here is not in attempting to establish a formal answer through detailed research (even if that were possible, given the elusive nature of the concept) but in ascertaining what would be a reasonable assumption—on first blush. Derrida's response to the question is given later.

[64] Tom Murray also says, "the integral community, taking Wilber's lead, has a propensity toward informalism, pragmatism, and popularism" (Murray, 2006, p. 9) and I would add to this: the languaging ensemble that is Wilber's style is no doubt an important reference point for expressivity mode; however, due consideration should also be given to the languaging modes of other integral theorists, whose chosen styles of communication may offer additional integral insights and languaging-template openings.

[65] On the Wikipedia page for "deconstruction" (2007a), Derrida is the only person mentioned in the first paragraph and the only deconstructionist mentioned in the first two. Apart from eight other deconstructionists listed in paragraph three, we have to wait until the eighth paragraph before a deconstructionist other than Derrida is mentioned again. In total, Derrida's name appears 73 times. The names of all other deconstructionists put together total 44.

deconstruction clearly indicates that it would be reasonable to assume that in the discursive realm in which Wilber mostly operates, *deconstruction*, first and foremost, refers to Derrida. And what is the object to which *deconstruction* directs its attention? Language. So, as an interpenetration of *integral* and *postmodern*, we might want to answer the following question: In what ways might languaging be mapped across structures of consciousness?

An integrally-oriented developmental psychologist whose work specifically concerns language is Susanne Cook-Greuter (1990, 2000, 2002, 2007). She identifies *the language habit*—the way in which we confuse our experience with our *conceptualisations* of our experience. Somewhat inferring Commons and Richards' Model Of Hierarchical Complexity, perhaps, she refers to Kegan, Basseches and herself regarding, "the fundamental language problem inherent in meaning making and scientific theorizing no matter how many systems are integrated and at what level of hierarchical complexity" (2000, p. 234).[66] She identifies the following features of the language habit:

- It is a universal for humans;
- It is innate but needs modelling in early childhood to emerge;
- It becomes unconscious once acquired;
- "It bundles the flux of sensory input and inner experience into labelled concepts shared with one's speech community";
- "It is so deeply ingrained that speakers of any given language are not aware of the reality construction imposed on them by their language";
- "It can become a barrier to further development if it remains unconscious, automatic and unexamined" (2000, p. 228).[67]

As an opening for further research, a pertinent question arises here concerning possible relationships between Cook-Greuter's identification of *the language habit*, her *construct-aware* developmental level (outlined below), constructivist theories, and *the linguistic turn* of postmodern philosophy, including Derrida's déconstruction.

Drawing upon her doctoral research, Cook-Greuter (2002) identifies numerous developmental stages of language habits as part of her model of ego development, and corresponds these to stages in the Action Logics of William Torbert's Leadership Development Framework. She groups the stages according to the following four levels: preconventional, conventional, postconventional, and transpersonal. Our primary interest here concerns the postconventional level.[68] In this, there are three stages. In ascending order of development, these are:

---

[66] She goes on to say, "except for those who study the limits of language professionally, only individuals at the second level of postconventional differentiation seem to appreciate the magnitude of humanity's automatic and unconscious dependence on the language habit for all aspects of living" (Cook-Greuter, 2000, p. 234). She does not make clear here whether "those who study the limits of language professionally" (Cook-Greuter, 2000, p. 234) are solely constituted by linguist specialists, or whether this term covers poststructuralist philosophers, and/or writers and poets, for example.

[67] Indeed, the following question is pertinent here: In what ways can one adequately examine language when the very tool one is using—language—is also the object under investigation? Perhaps, for instance, one needs to deconstruct as one goes—in a spirit of continual construct-awareness?

[68] It is worth also outlining here languaging characteristics from the two most developed of the *conventional* stages, as these bear relationship to the orthodox style expected of academic writing such as *this very* text, or regarding integral community discourse. The first is the *self-conscious* stage (aligned to

- The Individualist stage—aligned to Torbert's Individualist;
- The Autonomous stage—aligned to Torbert's Strategist;
- The Construct-aware stage—aligned to Torbert's Magician (a.k.a. Alchemist or Clown).

The Individualist stage she identifies as *relativistic*. She also relates this stage to *deconstructive postmodernism*, in which truth "can never be found. Everything is relative; there is no place to stand or judge from" (p. 21), whilst those at the Autonomous / Strategist stage "try to do justice to the complexity of life in their verbal expressions" (p. 26) and have "the capacity to see and accept paradox and tolerate ambiguity" (p. 24). Additionally, the shadow side of the self can be acknowledged to a greater degree and therefore a new integration and *wholeness* is possible" (p. 24); they walk the talk. Language clues include complex, flexible syntax, linguistic coherence, linguistic complexity. Lastly, at the most mature of these three postconventional stages, the Magician starts to realise "the absurdity or automatic limits of human map making in the representational domain" (p. 27); that, "all cognition is recognized as constructed" and there is the recognition of "paradoxes inherent in rational thought" (p. 27). And in terms of identifiable features, "the language of Magicians is often complex, vivid, authentic and playful…Magicians express a vast matrix of topics, concerns, questions, insights and commentary cleverly united into one complex sentence structure" (p. 31).

Given this schema, and given the aforementioned primary understanding that deconstructive postmodernism refers to deconstruction and thence to Derrida, one would reasonably assume that Derrida's languaging would be adequately mapped within the relativist, individualist stage. So, Is Derrida an Individualist? Is deconstruction merely relativist?[69] In a discussion regarding a preference between two different language habits—Edmund Husserl's perspectival *univocity* and James Joyce's relativist *equivocality*—John Caputo (1997) reports that,

> Derrida is struck by the self-limitation of both ideas. For unbridled equivocality would breed such confusion that "the very text of its repetition" would be unintelligible, even as perfect univocity, were such a thing possible, would result only in paralysis and sterility…

Torbert's Expert/Technician) (Cook-Greuter, 2002, pp. 15-16). Language habits at this stage indicate that the speaker regards themselves as "ultrarational"—that they have it all figured out. Value is place on the accumulation of facts. There is often a sense of superiority, of one-upmanship, often accompanied by a ridiculing or hostile tenor. The second (the one directly preceding *post*conventional stages) is the *conscientious* stage (aligned to Torbert's Achiever) (pp. 16-20) Language habits at this stage include seriousness, earnest conviction, intellectual scepticism, recognition of complexity, ownership of responsibility, revealing "I" statements, an ability to listen and restate expressions without adding one's own interpretation, asking questions such as "what does it feel like?", suppression of one's shadow through "positive" attitude, time-related terms have an emphasis on the local future and time effectiveness. Cook-Greuter comments that, at this stage, "formal operations are at their peak and rationality, progressivism, positivism and reductionism have their strongholds." (p. 18) Summarising the conventional mindset, Cook-Greuter comments that its major limit "is the acceptance of facts and the external world as real and its blindness to the constructed nature of beliefs, especially the grand myth of conventional science. Although complex scientific analysis is applied, the underlying assumptions of any system are rarely questioned or made explicit. … knowledge, measurement and prediction are taken for granted as means to control nature, self and society" (p. 20).

[69] My judgement at this point is not to attempt to differentiate the gamut of Derrida's *text* from a notion of Derrida's *déconstruction.*

> Deconstruction—as usual—situates itself in the distance between these two. It does not renounce the constitution of meaning and the transmission of scientific ideas…(p. 183).

Caputo reports here that deconstruction is *beyond* equivocity, and so beyond pluralistic relativism. But what of Derrida's (necessarily translated) languaging itself? Let's consider Derrida's (1987/1989) reading of Heidegger and the discourse surrounding Heidegger. In this, Derrida makes a judgement and takes a stand against something he identifies in the discourse. That certain something is *a discrimination against Spirit*:

> Is it not remarkable that this theme, spirit, occupying…a major and obvious place in this [genealogical] line of thought, should have been disinherited…No-one ever speaks of spirit in Heidegger. Not only this: even the anti-Heideggerian specialists take no interest in this thematics of spirit, not even to denounce it (pp. 3-4).

Judging this to be unjust, he asks, "why this filtering out in the heritage, and this discrimination?" (p. 4). He goes on to decisively comment: "This preliminary work has not yet been systematically undertaken—to my knowledge, perhaps not even envisaged. Such a silence is not without significance" (p. 5). Derrida here is operating with/in a *hierarchy* of values—favouring the value of work that is systematically undertaken over work which is not. Derrida then constructively elucidates three arguments concerning Heidegger's avoidance of the term, *spirit*—arguments which give preference to certain perspectives over others. (pp. 4-6).

Derrida's comments here are therefore *not* coming from a relativist perspective. He is making value judgments in favour of a discussion of Spirit and against Heidegger's inappropriate silence on the issue. Furthermore, deconstruction itself is clearly articulated as being *beyond* the relativism of unbridled equivocity: Derrida sees relativism as self-limiting, confusing, unintelligible.

With regard to the following developmental stage, Cook-Greuter (2002) identifies "the capacity to…tolerate ambiguity" and "the capacity to see and accept paradox" as two features indicative of the Autonomous-Strategist ("constructive postmodern") stage (p. 24). With regard to ambiguity, consider the following text from Derrida (1983/1985): "To deconstruct [is] a structuralist gesture… But it [is] also an antistructuralist gesture, and its fortune rests in part on this ambiguity" (p. 2). With regard to paradox, consider the following from Derrida: "All sentences of the type 'deconstruction is X' or 'deconstruction is not X' a priori miss the point, which is to say that they are at least false" (p. 4). These comments therefore align with[70] Cook-Greuter's Autonomous-Strategist stage (at least).

Lastly, in consideration of the most mature of the postconventional stages (i.e. the stages under consideration here)—the construct-aware Magician—consider the Cook-Greuter identifiers of this stage—authenticity, vividness, playfulness and complexity—with regard to the following two Derridean (1997/2001) quotes—the first with particular regard to authenticity:

> In principle, there is no limit to forgiveness, no measure, no moderation, no "to what point?"… Forgiveness is often confounded, sometimes in a calculated fashion, with related

---

[70] From a formal perspective, it could be stated that this paper will be employing Cook-Greuter's model as a heuristic, as it will not be conducting the type of sentence completion analysis she used as part of her methodology. It will, nevertheless, be conducting hermeneutic sentence analysis.

> themes: excuse, regret, amnesty, prescription, etc…[but] forgiveness must in principle remain heterogeneous and irreducible (p. 27).

and the following single sentence with its complex structure:

> For if, as I believe, the concept of a crime against the humanity is the main charge of this self-accusation, of this repenting and this asking forgiveness; if, on the other hand, only a sacredness of the human can, in the last resort, justify this concept (nothing is worse, in this logic, than a crime against the humanity of man and against human rights); if this sacredness finds its meaning in the Abrahamic memory of the religions of the Book, and in a Jewish but above all Christian interpretation of the 'neighbour' or the 'fellow man'; if, from this, the crime against humanity is a crime against what is most sacred in the living, and thus already against the divine in man, in God-made-man or man-made-God-by-God (the death of man and the death of God would here betray the same crime), then the 'globablisation' of forgiveness resembles an immense scene of confession in progress, thus a virtually Christian convulsion-conversion-confession, a process of Christianisation which has no more need for the Christian church (pp. 30-31).

Here, in addition to Derrida's vividness of language regarding concerns and insights into matters spiritual—with a sense of appropriate wordplay—we can also see Cook-Greuter's identification of the construct-aware Magician where "concerns, questions, insights and commentary cleverly united into one complex sentence structure." A plausible hypothesis, then, would be to consider that these comments from Derrida centre around the perspective of The Magician—a level *beyond* Wilber's Teal / Integral / "post-postmodern" / Yellow vMeme.

In short, this evidence supports the hypothesis that the above text from Derrida is operating from the construct-aware stage. But what does Derrida (1983/1985) himself say about reconstruction? Is deconstruction negative?

> The undoing, decomposing, and desedimenting of structures…[is] not a negative operation. Rather than destroying, it [is] also necessary to understand how an "ensemble" [is] constituted and to reconstruct it to this end (p. 3).

Derrida rationally differentiates deconstruction from destruction and indicates that deconstruction is a constructive activity. He also explicitly reflexes upon its subtle dialectical quality. His writing demonstrates a high level of developmental maturity, in which deconstruction is recognised and reflexively enacted in a post-relativist, dialectical, construct-aware mode. Derrida and deconstruction are clearly something Other than that signified by Wilber in his use of the term, deconstructive postmodernism.

Thinking Critically About Integral Theory

So a question arises: What might account for such confusion between deconstruction and deconstructive postmodernism? Through attending this question, an anomaly stemming from Wilber's universalising interpretation of the notion of deconstructive postmodernism can be seen to emerge, opening up a conversation concerning possible relationships between critical thinking and critical theory.[71]

Boomeritis: An (un)Critical Americanitis?

Let's turn firstly to Derrida (1983/1985) for an insight into this question: "It is true that in certain circles (university or cultural, especially in the United States) the technical and methodological 'metaphor' that seems necessarily attached to the very word deconstruction has been able to seduce or lead astray" (p. 3). The suggestion here is that the U.S.A. constitutes a substantively *special* case of being "led astray" by the term. Referencing Curler (1982), Ben Agger (1991) continues that there is a distinction to be had—perhaps between Derrida's déconstruction and a certain metaphorical use of the term, or perhaps between Derrida's text and a "methodology" called *deconstruction*—and that this strongly affects the U.S.A.: "Literary critics prise out of Derrida a methodology of textual reading called *deconstruction*. This deconstructive method has spread like wildfire through American humanities departments" (p. 112). Wilber (1995) develops this line of reasoning regarding deconstruction:

> Here was a "literary criticism" made to order for the tenured radicals of the sixties: haven't the wits to build a building? No problem, just blow one up instead. Thousands of Ph.D. dissertations in deconstructionist themes were issued by American universities…
> Deconstruction as a movement never caught on in Germany or France or England (or anywhere else for that matter)…(pp. 721-722, n. 4).

Here, Wilber emotively reinforces Derrida's and Agger's more qualified comments, asserting that deconstruction as a movement never caught on *anywhere* other than in the United States of America.[72] He also seemingly implies that the sensibility of the cultural movement was sufficiently violent to warrant use of—shall we say—a *weapon of metaphorical destruction*—namely, the metaphor of *destroying* a building by explosive detonation (rather than, say, carefully *deconstructing* the aforesaid building, should such demise be warranted).[73] He furthermore implies that such destructive American deconstructionists were insufficiently *intelligent* to *con*struct conceptual "buildings" or structures. An alternative understanding of deconstruction's contribution is offered by integral commentator, Ray Harris (2004):

> The major function of green is to consciously deconstruct values in order to reconstruct them as freely agreed principles. Green is actually a very moral stage. It is orange that is the most amoral. It is orange that tends to unconsciously and destructively deconstruct – green arises to repair the damage (§ *Misunderstanding postmodernism*, ¶ 18).

---

[71] And possibly neo-imperialism

[72] It is possible, of course, that Wilber meant "anywhere" in a non-literal, colloquial way—i.e. where he didn't mean *all* places, just *most* places or *all places mostly*… or some variant. It is also possible that his intention was for the reader to take such utterances "with a pinch of salt." But if this were argued, how would the reader be able to distinguish between "serious" intent and "throw-away" comments? Would it depend on the maturity of the reader? Even if such comments were not believed, what (metaphorical) non-verbal communication might be taking place here?

[73] A forerunner to Derrida's *déconstruction* was Heidegger's "positive" *Destruktion*. Such a philosophical genealogy would beckon a yet finer distinction to be made than that being made here.

If this alternate understanding is true, then Wilber's unevidenced text here could be seen as arising from the Orange vMeme, and could be interpreted as his substantive underappreciation of the Green vMeme. The idea that the Orange vMeme can be destructive in this way would be in keeping with Gare's comment earlier concerning the destructive nature of modernity. Wilber, in turn, also substantively critiques modernity, yet his later writings do not foreground the destructive aspects of Orange in relation to those of Green (see Appendix A). A conversation opening here would be: How might we ascertain or evaluate such a distinction between modern-mental-rational and inclusive-integral levels?

American and Other Interpretations

From a slightly different hermeneutic perspective, the following question arises: From whence does such violence emanate? Which AQAL quadrants are implicated here? Lower right power structures? Lower left cultural values? Upper right bodily urges? Wilber's upper left subjectivity? or something tetra-arising? One interpretation is that Wilber appears to be referring to an event occurring in (his) lower left quadrant—in American cultural values.

Interestingly, Ben Agger's (1996) interpretation of the situation is both significantly convergent and significantly divergent from Wilber's. In terms of agreement, Agger reinforces the hypothesis that there is something singularly wayward with America's interpretation of postmodernism and deconstruction. In terms of difference, Agger suggests that, rather than being related to America's *excess* of radical politics, it is actually American culture's *deficiency* in radical politics that is the cause of wilful or careless "ignorance" regarding deconstruction:

> the American reception of postmodernism has tended to ignore postmodernism's stress on the linkage between discourse and democracy, a linkage that I contend is precisely the opening of Derrida's critique of western logocentrism to radical politics. Put differently, the American reception of postmodernism suppresses (or simply never learned) the social and intellectual history of French postmodern theory, which emerged out of the 1968 May Movement as a critique of Stalinist and orthodox-Marxist authoritarianism in preference for a radical micropolitics of everyday life (later to emerge as new social movements theory). Far from turning away from politics, people like Derrida and Foucault viewed their own philosophical work as intensely and obviously political, contributing to the heterodox French left project, especially in ways that embrace the feminist and gay/ lesbian movements (¶ 14).

Could an adequate interpretation of this instance, then, be that the American nation-culture constitutes a "pathological" aberration among the plurality of global nation-cultures, in that it, substantially alone, has interpreted postmodernism as a form of destructive violence against the radical politics of an authentic democracy? a masculinist *straight*-jacketing of meaning—from, shall we say, French fries (delicately-sautéed *postmoderne*)—to McGiveMeGiveMeGiveMeU.S.NewNewsNewsweakNewspeakFreedomNowNow "Freedom" fries?—contributing to an exponential escalation of the prison population of concepts?[74]—a suppression of freedom in the name of freedom?

---

[74] Reviewing the prison population in countries of the world, consider the following statistics (figures show prison populations per 100,000 inhabitants): England and Wales 148; Australia 125 ; Canada 107; Italy 104; Germany 94; France 85; Ireland 72; Norway 66; Japan 62; USA 737 (Walmsley, 2007). What

Perhaps not. Perhaps, conversely—as Benedikter (2005) indicates—the U.S., including Wilber's sizable contribution, leads the world in new thinking—in integrating, specifically, "Pacific" or "Eastern" conceptualisations. There is certainly strong evidence that points this way, too. Then again, does it have to be either/or? It is surely not the intention of well-respected American authors to perpetuate neo-imperialist languaging; but, if Wilber's comment is true, and if integral theory, developmental theory or socio-cultural theory seeks to speak from a global rather than a local (i.e., American) perspective—and to a global rather than a provincial (i.e., American) audience—then note might be made that the rest of the world might not have substantively partaken of such a cultural fad as *deconstructive postmodernism*—or, at least, might not have substantively partaken of a "vulgar" *interpretation* of postmodernism. It would seem that the theoretic transition from *modern* to *integral* needs to take into account the importance of different cultural types—specifically addressing the 242 of the 243 nation-cultures that are *not* the U.S. of A. (regardless of how many *sub*cultures the U.S.A. includes).[75] If cultural type or state can skew the normalised theoretic structure of cultural development to the extent indicated above, then such *straight* linear interpretations of AQAL's default theoretic hierarchy of significance between levels of development and cultural type and state become problematic or untenable. Instead, a much subtler, more complex theoretic structure needs to be envisaged, where cultural variants (such as the identification of the AQAL *state* of neo-imperialism regarding the current U.S.) can be seen to be a major player amongst integral elements—the AQAL ecology of types, states, lines, levels and quadrants / native perspectives.

Another view on this would be to address pertinent (lower right quadrant) global power structures. Notwithstanding such considerations, dominant discourse from Wilber suggests that obstacles to embracing Integral Transformative Practice "are not found exclusively in boomers or in Americans. Pluralistic relativism is a universally available wave of consciousness unfolding…" (2000c, p. 31).

This statement could arguably be supported by non-American integral research and/or concerning non-American concerns, such as Olen Gunnlaugson's (2004) research regarding "unhealthy" Green—and its moment of (potential) transformation—in a Swedish college.[76] And, indeed, a picture would seem to be emerging here that, regardless of first (Wikipedic or popular) impressions, an important distinction should be made between Derrida and deconstruction, in that the latter might have been appropriated (or somewhat forcibly *prised out* of Derrida—as Agger has intoned) by humanities departments both in the States—and elsewhere—to become something quite *other* than Derrida's *déconstruction*.

Nevertheless, even where this cultural stage is identified in other countries, it would still appear to be the case that the "virulent" memetic strain of postmodernism seemingly constituted by the term deconstructive postmodernism is found in the U.S. in an unusually high ratio. According to Wilberian theory, this would suggest that the Green vMeme is significantly more prevalent in the States than elsewhere. Yet, Wilber (2000c) indicates that Europe's memetic

---

accounts for such a cultural discrepancy with regard to the US? What socio-cultural noospheric/languaging features might there be associated with such a difference? or, put another way: what Wilberian left-hand quadrant correspondences (both individual and cultural) might there be to these Wilberian right-hand quadrant phenomena (both socio-structurally and regarding the physical experiences of prison inmates?)

[75] Noting that this does not necessarily concern other features of postformal/postconventional development, whether in the US or elsewhere.

[76] Notwithstanding its subsequent malaise.

centre of gravity is more advanced than the U.S. and that it has a significantly stronger Green vMeme presence than in the U.S. (p. 119, fig. 6-2). But then, if this is so, why doesn't Europe apparently suffer as much "boomeritis"? What might explain this anomaly, this inconsistency between the two features:

1. The difference between Europe and The States with regard to the strength of the Green vMeme and
2. The difference between Europe and The States with regard to the strength of the Green vMeme pathology of "boomeritis"?

How much is deconstructive postmodernism a function of "boomeritis"? How much a question of American-itis? No doubt, a complex question. But, as the above discussion has perhaps indicated, integral theory might still have a way to go if it is to adequately align, resonate, or become congruent with the complexity of the world. We need to start thinking complexly about integral theory.

Thinking Complexly About Integral Theory

> If Jean Gebser and Sri Aurobindo were alive today we might guess that they would see in the wondrous emergent properties of complex adaptive systems…an opening for the invisible. And perhaps the science of the future will validate such thinking, finding in the influences enfolded in the implicate order or the quantum vacuum field the infinitesimally tiny whispers that pivot us toward our personal and collective fates (Combs, 2005, §*Gebser and Modern Science*, ¶ 9).

Both the butterfly effect of "pivotal whispers" and the "wonder" of complex adaptive systems can be theoretically encompassed by complexity theory. Perhaps if Jean Gebser and Sri Aurobindo were alive today, they might advance integral theory via complexity theory as an integral part of the artful science of the future, and not only validate such an opening into Mystery, but reflexively realize their participation in it through such theoretic evolution.

The considerations explored in the context below follow a specific interpretation of complexity: that of complexity theory with specific reference to the complexity characteristic of (fractal) recursion.

Recursion will first be applied in relation to the notion of substantive content, exploring the idea that qualities of conceptualization and textual style can be viewed as a theoretic recursion of larger "content parcels"; further, that this perspective can be facilitated by the ludic neologism, nanotextology, and that the substantive content of integral theory should be reflected at all (or most) fractal scales—an integral nanotextology.

Secondly, a recursion of nonduality is considered, in which connections between nonduality, dialectics and deconstruction are gestured toward. Address is also given to the relationship between complexity theory and quantum theory via holonomy and David Bohm's explicate and implicate orders.[77]

---

[77] For a scholarly critique on Wilber's regard for David Bohm's ideas (and thence for Jenny Wade's), see Falk (2007).

Nanotextology (A Recursion of Content)

Many authors within both integral and postmodern discourse attest to the need to substantively regard languaging. Consider the following, for instance.

> A critical poetics transcending both the empire of reason and the asylum of un-reason has `become an urgent concern…(Kearney, 1998, p. 9).

> No matter how seemingly insignificant, every rhetorical gesture of the text contributes to its overall meaning. How we arrange our footnotes, title our paper, describe our problem, establish the legitimacy of our topic through literature reviews, and use the gestures of quantitative method in presenting our results—all contribute to the overall sense of the text (Agger, 1991, p. 115).

And following Whitehead's call for the production of a diversity of metaphysical schemes, Arran Gare (2002) advocates for

> the development of new abstractions that will allow us to understand the immanent dynamics, intrinsic significance, and the diversity of processes participating in the creative becoming of the world, including ourselves. This is the condition not only for an effective opposition to the destructive imperatives of modernity. It is the condition for overcoming it (p. 50).

Throughout his seminal work, *The Ever Present Origin*, integral theorist Jean Gebser (1949/1985) also refers to the impossibility of fully realising the integral structure of consciousness unless there is a close scrutiny of current concepts, attitudes and modes of thinking—languaging emanating from the mental (modern) structure. From such considerations as these, we can readily ascertain that in order to embody integral understanding, we need to be linguistically-aware. The formal semantic characterisations of the concepts, *style* and *content,* can evolve into a postformal conceptualisation which might not only view them as a dialectically interpenetrating pair, but also as in reference to different recursive *scales* of substantive "content transmission." The alteration of "content chunks" *might* be the major communication conveyor—or "fundamental tone"—but the alteration of format, syntax and terminology can act as writing's metaphorical *non-verbal communication*; and frequently, the "timbre" of such subtext may be such that the fundamental semantic message is substantively changed.[78] (For instance, the hidden curriculum "timbre" of an education system might unwittingly *dominate* its purported "fundamental" mission, as per Gatto, 1992). And if, like Blake (1803/1960), one is able "to see a world in a grain of sand," then one might be able to see an entire integral theory in just one word. Perhaps an integral micropsychology, an integral micropolitics; a linguistic recursion of integrality.

Wilber's thinking can be arguably seen to be primarily conveyed by means of a high-order manipulation of "chunks" of "content."[79] Plausibly the most *stylistically* complex he gets is when he expresses "non-dual realisation," notably his use of spiritual paradox—when he intones, for example: “Aware of color, you are colorless. Aware of time, you are timeless. Aware of form, you are formless.” The conscious employment of postformal paradox is also evident in Gebser’s (1949/1985) writing—such as that between clarity and complexity (a *clarity~complexity*[80] dialectic[81]), as follows:

---

[78] See footnote 52 regarding the metaphor of harmonics.

[79] Content, as conventionally understood, can be seen as "chunks" whose *interiors*—e.g., semantics—remain (apparently) undisturbed, unaltered.

> Even where the measurements of contemporary methodologies are based primarily on quantitative criteria, they are all vitiated by the problem of the antithesis between "measure" and mass... Our method is not just a “measured” assessment, but above and beyond this an attempt at "diaphany" or rendering transparent (p. 7).

The content involves an explanation concerning the need for transparency, for clarity. Yet the linguistic style is unorthodox in (at least) three ways: firstly, through the use of quotation-marked “measure”/”measured,” secondly, through reference to a dialectic between it and “mass,” and, thirdly, through use of the neologism, “diaphany.” A take on this apparent paradox is that it remains unresolvable within a mental-perspectival structure but becomes transparent, congruent, within an integral-aperspectival one. The quest or calling for those who seek to move beyond the conventional structure is surely to be able to use such textual *startlement* as a wake-up call rather than as a frustration. More is then said, however, concerning such transparency:

> Our concern is with a new reality—a reality functioning and effectual integrally, in which intensity and action, the effective and the effect co-exist; one where origin, by virtue of "presentiation," blossoms forth anew; and one in which the present is all-encompassing and entire. Integral reality is the world’s transparency, a perceiving of the world as truth: a mutually perceiving and imparting of truth of the world and of [us] and of all that translucces both (p. 7).

This “explanation” does not appear, however, to be an explanation from the point of view of the mental-perspectival structure of consciousness—a “rational” mindset. It is rather, to my reading, an explanation from an integral-aperspectival one. We might wish to pause here and ponder on the etymology of *explanation*. It means, “to flatten out”—as in the *flattening out* of a three-dimensional object to a two-dimensional drawing. Not only is such an “explanation” a reduction from three dimensions to two, but it is a two dimensional ex*plan*ation, a privileging of a “plan” or top-down view, in contrast to the different rendering offered by a side view, an “elevation” perspective. Questions arise: Is such a top-down view aligned with the false transcendence of a disembodied Cartesian thinker? and: What relationship might there be between a depth-revealing elevation and an integral-aperspectival structure of consciousness? A solution might seem to involve a resonance with Gebser’s use of a sphere as metaphor for integral consciousness. In particular, we should note his neologism, *presentiation,* and the unconventional syntax of the verbal configuration regarding *translucent*. The former is suggestive of “making something (fully) *present*” (rather than: absent; partially present; in the past or future; only *apparently* present…). It is also suggestive of *presence*, and *presencing*—a concept which is foregrounded and theoretically extended by Otto Scharmer (2000, 2005). The latter also aligns with the privileging of verbs over nouns (relative to “conventional” discourse) found in both poststructuralist and process (e.g., Whiteheadian) philosophies. Further elevated explanation, depth or diaphany concerning the complex clarity of integrality is perhaps offered when Gebser states,

---

[80] The symbol “~” seems suitably suggestive of the interpenetrative qualities of complex dialectics

[81] Clarity and complexity are, of course, not antonyms, yet a fruitful dialectic can be identified between them in this context. This is an indication that dialectics, like most other valuable operations, is an art.

> Whenever the linguistic structure is freed from the perspectival fixity without reverting to linguistic chaos, initial aperspectival, no-longer-rational but arational manifestations are visible. Where the stylistic inversion of rational syntax transforms the sentence…The achronon shines forth and its sustaining-in-truth presupposes that the rational is not just negated but overdetermined, whereby it necessarily foregoes its claim to exclusivity… The mental is reduced to its proper sphere of the conceptual, visible, palpable, and demonstrable, and can no longer function obtrusively, but must open the path, the leap towards verition... (pp. 503-504).

Here, neologisms include: *aperspectivality, overdetermination, achronon,* and *verition.* The rational can only go so far and should not be *over*used but rather be *appropriately* used as part of communication at an integral level. It could be said that his neologism, *verition*, is a vertiginous turn on the conventional, mental structure's *verity*—"being in accordance with reality." One could further "note" that *accordance*—from *accordare*—literally means "being of one *heart*" (noting two semantic harmonics of *being*) whilst an aphesis of such *accord* is a musical "chord." "Verition" might suggest we should not (merely) quest "truth," but rather, *a heartfelt accordion of truth*. Habits of our heart, harmonics of our text, de-/re-constructed. Gebser's words are beautiful but, to many, they are also dense and difficult. Yet, as Agger (1991) says of Derrida: "[he] would defend his own density by arguing that difficulty educates. He would also say that simplicity brings false clarity" (p. 114). Such are the dialectics of clarity. It would appear Gebser might very well agree with him.

Another unorthodox languaging is that offered by integral-global philosopher, Ashok Gangadean (2002, 2006b). He distinguishes between two orders or "technologies" of perceiving, thinking, speaking, being: firstly, an egocentric one, and, secondly, an integral-holistic-dialogic one, and differentiates between these through novel typographical syntax. Namely, he uses "/…/" for egocentric languaging—as in /mind/—and "((…))" for dialogic-global-integral languaging—as in ((mind)). In this way, these textual marks can be used as a micro-integral transformative practice, a startling ((wake-up call)) to partake of an integral spirituality which can be identified in the ((logic)) of each ((word)). Moreover, Gangadean's work explicitly connects integrality with urgent global concerns and spirituality, thus congruently aligning with worldcentric perspectives.

There is no doubt a plethora of postformal-postconventional-postmodern-integral languaging options. But to generalise, one might say that we need tools for our Wilberian left hand quadrants as well-crafted and powerful as those currently in operation—and those being exponentially developed—for our Wilberian right hand quadrants. We urgently need the linguistic equivalent of nanotechnology: we need an integral nanotextology. An example of its use might be demonstrated through postformally exploring the semantic ecology among deconstruction, dialectics and nonduality.

Holonomic Nonduality (A Dialectical Recursion)

In AQAL topology (for example, 1979/2001, pp. 126-144), nonduality occurs at the final stage of (individual) development. Wilber arrives at this understanding through addressing nondual spiritual traditions, notably Zen and Dzogchen.[82] When he writes about the nondual, he tends to do so as the blossoming poetic culmination of much theoretic prose. This format thus mirrors somewhat the model of spiritual development he explicitly discusses. In this release from Wilber's dominant style, the realisation he expresses is in paradoxical reference to the many developmental waves he otherwise discusses—namely, "there's only one wave, and it's everywhere" (1979/2001, p. 142). Further wisdom flows: "It is always already undone, you see, and always already over" (p. 345), and, apparently aligning somewhat to Eckhart Tolle's (2001) *The Power of Now*: "There never was, nor will there ever be, any time other than Now. What appeared as that primal moving *away* from Now was really an original movement *of* Now" (Wilber, 2001b, p. 143). In this context, he is also aware of the limitations of formal theory: "Galaxies rush through your veins while the stars light up the neurons of your night and never again will you search for a mere theory of that which is actually your own Original face" (Wilber, 2000c, p. 141).

This part of his writing has a substantially different quality to the rest of his theoretic writing, which generally has a less poetic, less paradoxical, more technical (and sometimes "polemic") character. As such, his text displays something of a duality. And, although such a comment might appear to be insubstantive in that it refers to style rather than content, such a perspective, as we have seen, is not necessarily a postformal one. Moreover, a proposition I will be exploring below is that the theoretic conceptualisations concerning all stages prior to Wilber's nondual are themselves generally embedded in a dualistic (Cartesian) template. Pertinently, I will explore the metaphoric value of this duality in positing that although Wilber addresses nonduality, his mode of theorising does not honour the potential contribution of nonduality. Moreover, I contend that this is because he has not fully actualised the import of postmodernism's complexity theory—notably the component of recursion, fractality, holonomy.

But first, let's turn to another type of discourse in which nonduality can be found: poststructuralist discourse. One could argue that Derrida's address of the nondual binary of identity and the Other, for example, is central to déconstruction. The logistic structure of dialectics, also, can be seen as being based on a type of nondual premise. Wilberian theory sharply differentiates between final stage nonduality (individual enlightenment) and these other types of nonduality, which are mapped as forming part of the Wilberian Green vMeme—relativistic postmodernism. But is such an absolute differentiation justified?

One of the developmental psychologists Wilber has called upon to support his theory is Jenny Wade. But Wade's (1996) theoretic understanding of nonduality is significantly different from Wilber's. Referring to the holonomic paradigm of explicate and implicate orders—a central contribution of David Bohm to quantum theory—she states,

> The holonomic paradigm posits the existence of (at least) two dimensions of the same reality in a nondual whole—the material manifestation of energy as the explicate order, which is enfolded in, and emanates from, an implicate transparent order of pure energy,

---

[82] A cautionary note, though, is given by Roy (2006b) when she concludes: "Wilber's AQAL model does not contradict Dzogchen thought per se; but…Dzogchen cannot be fitted into its framework" (p. 119).

> which is infinite and absolute. … Their conjunction is like the two "sides" of a Moebius ring… (p. 201).

From this understanding, nonduality might not only be "found" at the final stage of individual development, but could permeate the whole integral model. And it would do so via a holonomic paradigm (*holonomic* signifying the generic conceptual template from which *hologram* is linguistically constructed). Holonomy can be seen to be in familial relationship with a non-Euclidean geometric principle found in complexity theory—namely, recursion: the production of fractals. In this way, a type of nonduality could be theorized at any developmental level of integral theory, including postmodernism. This would open a way to exploring, among other things, the theoretic relationship between Derrida's déconstruction and the spiritual deconstruction of the ego. Such a theoretic venture would resonate with the seminal work on postmodern spirituality by integral philosopher, Roland Benedikter (2005), in which the spirituality of poststructuralists—notably, Derrida, Deleuze, Feyerabend, Foucault, and Lyotard is identified, explored and valorised.

Wade also elicits transpersonal researcher, Stanislav Grof (1985), as applying "holonomic metaphysics to developmental theory, beginning with a criticism of Wilber's emphasis on linearity"—quoting Grof as saying,

> As much as I agree with [Wilber] in principle, the absoluteness of his statements seems to me too extreme. The psyche has a multidimensional, holographic nature, and using a linear model to describe it will produce distortions and inaccuracies. …
> My own observations suggest that, as consciousness evolution proceeds [from Authentic to Transcendent consciousness] and beyond, it does not follow a linear trajectory, but in a sense enfolds into itself (Grof, 1985, p. 137, cited in Wade, 1996, pp. 201-202).

Grof seems to making two points here, both concerning holonomy. The first concerns "the absoluteness of…statements."[83] The second concerns the nature of consciousness evolution *from and beyond Authentic consciousness.*[84] The latter understanding—that Authentic and post-Authentic consciousness enfolds into itself—would specifically problematise Wilber's theorizing of levels specifically *for Green and beyond*, whilst the former understanding—concerning the nature of statements—regards the linguistic fabric of theorizing: Wilber's *type* of theorizing.

The relevance of an integral nanotextology can be identified here. Specifically, whilst from a formal perspective the issue of "theorizing type" may be regarded as being "merely style" and thus insubstantive, such simplicity is (most plausibly) untenable from a postformal perspective. Postformally speaking, the type of linguistic constructs employed—the particular qualities in statement construction—form part of the substantive "content." Much poststructuralist discourse implicates the importance of such considerations; through the neologism *nanotextology*, I am attempting to bridge such consideration—formally seen as "style"—with more macro-considerations—formally seen as "content"—via the developmental understanding that postformally, *style* and *content* are holonomically related and therefore both substantive—as, shall we say, *postformal content.* Such a statement, however, is not necessarily to relativistically give such micro and macro postformal content modes equal address, but rather posit that there can be a theoretic framing regarding their connection (or communion) *and* their difference (or agency). Using nanotextology in this instance, the framing of concepts or statements as *absolute* could possibly be seen as a type of Blue vMeme (conformist, technicist or mythic) manoeuvre (a prioritisation of *conceptual fundamentalism* or conceptual *technology*) or as a type of Orange (formal) manoeuvre (a prioritisation of conceptual *definition*), in contrast to, say a post-Orange (postformal) manoeuvre (a prioritisation of conceptual *ecology*).

---

[83] And I note here that Grof appears to be implying that *all* of Wilber's statements are too extreme, thus falling into something of an absolutist text

[84] Constituents of Wade's (1996) Authentic stage include identification of the Other, the desire for personal growth, postformal operations, empathy, and respect for diversity (p. 169, Table 9)—features regarded elsewhere as postmodern or Green. See, for instance, Beck & Cowan (1996, p. 260-273).

From this postformal theorizing perspective, other features of Wilber's theorising could be problematised. An example would be his framing of the "Pre/Trans Fallacy" (Wilber, 1980) which *sharply* distinguishes between the pre-formal and the post-formal. Here, the imperative to distinguish sharply and non-paradoxically can be seen as a pre-postformal manoeuvre. In contrast, from a subtler, postformal perspective, Stanislav Grof comments, "the distinction between pre- and trans- has a paradoxical nature; they are neither identical, nor are they completely different from each other" (1985, p. 137, cited in Wade, 1996, p. 202). Here, both conceptual agency (or difference) *and* conceptual communion (or mutual identity) are foregrounded.

A framing that Wade uses in relation to either/or (pre-postformal) thinking is constituted by the metaphor of Newtonian physics: "Regression and transcendence are neither opposite nor the same, though they may appear to be in a Newtonian conceptualisation—and it may be useful to speak of them in those terms there" (p. 202). Elaborating on this, a developmental hierarchy of conceptual templates based on developments in physics can be imagined: using Einstein's theory of relativity and then quantum mechanics as metaphorical templates for types of conceptualisation. Developmental psychologist Jan Sinnott (1998) has made such a move—at least in relation to Einstein. She compares his theory to postformal *relativistic* thought. Although Piagetian commentator Helena Marchand (2001) critiques Sinnott's use of metaphor, I would contend that such a judgment emanates from a *formal* mindset which does not appreciate the theoretical significance of metaphor—such appreciation can be seen as coming from postformal understanding. The theoretical significance of metaphor is indicated, for example, by Alfred North Whitehead—a philosopher whose work sits at the very core of AQAL's evolutionary theory (Hargens, 2001; Roy, 2006b, p. 123; Wilber, 1995, pp. 42, 49, 78).[85] Arran Gare (2002) valorises Whitehead's recognition of the primary role that metaphors play "in thought, language, philosophy, and science" (p. 48). The postformal understanding of the role metaphor plays in languaging, including that of theory, is substantively explored in the seminal work of Lakoff and Johnson (1980/2003; 1999). Their research, which has substantive implications for the sublation of formal thinking, convincingly demonstrates that, "the traditional view of metaphor is empirically false" (1999, p. 118) in that, "metaphorical thought is what makes abstract scientific theorizing possible" (p. 128). From a postformal perspective, metaphor is not mere linguistic ornamentation, but rather, is (varyingly) implicit in the very fabric of all communication.

Given this, an apt metaphor for dialectical thinking might well be quantum theory[86]—connoting an integrative-but-fluxing dialectic between wave and particle. But the window of possibilities here can be seen to extend beyond such physiospherical metaphors to biospherical ones. Much fruitful research in this direction could seed new vital(ising) ideas, "living" concepts, "organic" templates.[87] Jenny Wade can be seen to refer to such a postformal conceptual template in her discussion regarding the theorising of relationships between regression and transcendence or between the preformal and the postformal via a holonomic paradigm:

---

[85] I am referring to Eros / Creativity as the universal "drive to integration" (or transcendence) here, and to holon theory. Gertrude Blanck and Rubin Blanck also make a central theoretical contribution.

[86] Sinnott (1998) *does* refer to quantum theory but does not make the particular distinction I am making here.

> The regression/non-regression argument is resolved because it is placed in the context of epistemology outside historical time. This creates a heterarchical conceptualisation of development employing both linear and nonlinear paradigms that *alters the structure of developmental theories that purport to address these levels* (Wade, 1996, p. 202, emphasis in original).

Such a template based on complexity rather than duality could have incisive repercussions for AQAL. Consider, for example, the following constitutional AQAL point of departure:

> If the Kosmos is not holistic, not integral, not holonic—if it is a fragmented and jumbled affair, with no common context or linkings or joinings or communions—then fine, the world is a jumbled mess the various specialities take it to be. But if the world is holistic and holonic, then why do not more people see this? And why do many academic specialities actively deny it? If the world is whole, why do so many people see it as broken? And why, in a sense, *is* the world broken, fragmented, alienated, divided? (Wilber, 2000c, p.41).

Here, Wilber constructs two opposing camps: (a) the camp of fragments, jumble, mess, breakage, alienation, division; and (b) the camp of holism, integrality, holons, linkages, joinings, communions, wholeness. This construction is dualistic: no interpenetration between the two camps is allowed for. But why does it necessarily have to be either/or? A complex-aware theoretic template could embrace *both* camps. Through this, the world could be identified as: whole *and* jumbled, holonic *and* entangled, broken *and* linked—in varying ways. Differentiation could then be identified between contexts where Wilber's general argument is valid and those contexts where it is not. For example, whilst a panoramic perspective might display the suitability of various AQAL orienting generalisations, a local (detailed) perspective—with its specific requirements—might even display *the very inversion* of these same generalisations. As an apt metaphor, consider the following. A traditional dance whose *general* advancement forward is constituted by the specific ("local" / detailed) algorithmic routine of *one step back, two steps forward*, is substantively constituted by both advancement and retreat—though at different recursive scales. From a macro (AQAL-like) perspective, the *one step back* phenomenon would appear as a messy datum interfering with the theoretic elegance of advancing forward; perhaps something even to be eliminated. Conversely, the substantive interest of a dance teacher with a dance student whom was only *stepping forwards*—failing to take a step back each time—would be to focus (perhaps repeatedly) on the instruction to *go backwards*. If this was a common problem, perhaps an academic might then assist in the matter through conducting a detailed investigation into the failure to go backwards among dance students. The whole context here would be the goodness inherent in going backwards, and the inappropriateness of moving forwards. In other contexts, however, Wilber's thrust of argument would be highly pertinent. The issue is one of context and of recursive scale. An integral theory explicitly based on a complexity template could adequately accommodate such differentiation; an integral theory based on a non-complex or non-dialectical complex template could not so readily. Moreover, even where Wilber's general argument is appropriate—as in the indication above that academia could benefit from less specialisation and more transdisciplinarity—complex cross-currents can be identified. Wilber frequently derides Cultural Studies, for example, yet this young academic field has partly arisen via a similar evaluation to the one Wilber makes himself, namely, insufficient connectivity. Cultural Studies is transdisciplinary. And Integral Studies is transdisciplinary. Both are appearing to attempt to counter "traditional" academia's tendency toward specialisation. There is no need for antipathy here.

---

[87] Perhaps inspiring and/or apt metaphors regarding the potential significance of possible alteration of conceptual templates might include (a) Edgar Morin's (1999/n.d.) principle regarding, "the mole that digs underground and transforms the substratum before anything is changed on the surface"; (b) Sohail Inayatullah's Causal Layered Analysis where the myth / metaphor layer is seen to underpin the worldview layer which in turn underpins policy and litany layers respectively; (Sohail Inayatullah, 2000, 2004); and (c) the following: Imagine a vector applied near the circumference ("surface") of a wheel; imagine an equivalent vector applied near the centre ("core") of the wheel; even though each vector is similar to effect, the one applied nearer the centre of the wheel will effect a greater rotation of the wheel than the one applied nearer the circumference.

To summarise: Through embracing a complex-aware template,[88] specific AQAL features can be problematised or deconstructed, constructively leading the way to higher orders of integration. Wilber's (1980) Pre/Trans Fallacy, for example, can itself be seen as a (partial) fallacy in the way it is currently conceptualised. The implications of such postmodern theorising for integral theory in general and Wilberian theory in particular are wide-reaching. As Wade (1996) indicates: "The linearity inherent in evolutionary models is a contextual convenience" (p. 200).[89] Such an understanding might lead one to conclude that there is "no way out" from this poststructuralist statement to integral evolutionary theory. One might instead recognise, however, that the way to an integral evolutionary theory that moves beyond dualistic modes of theorising is through embracing the postformal modes of cognition found in postmodernism. In short, the way out is through.

---

[88] The interpretive stances constituted by such a template would most probably be in contrasted reference to the modern worldview which has extended and/or over-extended (a) the cosmological estrangement heralded by Copernicus and concretised by Newton, (b) the ontological estrangement initiated by Descartes, and (c) the epistemological estrangement instigated by Kant (see Tarnas, 1991, p. 416-422). Abstract theoretic mantras such as the yinyang-DNA-Ouroboros template elucidated by Clifford Matthews (2002, p. 220-226) could also be generative here.

[89] Such a statement concerning the inadequacy of linear models of development *as a whole* could be seen to be aligned to Grof's comment above regarding the inapplicability of linear modelling *beyond* the Authentic stage if one considers that both can be true from the perspective, say, of different quadrants—where Wade's comment can be seen as a postformal left-hand quadrant understanding, and Grof's as a postformal right-hand quadrant understanding—*or* perhaps of different levels, where Grof's statement arises from a conventional level and Wade's from a postconventional one. Another conversational opening, no doubt.

Conclusion

> *The soul sings of the glory of God inasmuch as it follows its own folds, but without succeeding in entirely developing them, since 'this communication stretches out indefinitely"* (Deleuze, 1988/2006, p. 3).

An integral re-viewing of the developmental wave of postmodernism can highlight the current undervaluation of thinking postformally. Postformal cognition can be enacted in relation to a variety of concerns and interests including integral theory itself. Integral theory thus contains the means to develop itself—a participatory autopoiesis. In this way, the manifold contributions that Wilber has offered to integral theory and its panoramic horizons can be enhanced and reconfigured. AQAL maps contextualism, dialectics, and complexity as postformal features. Integral theory could more reflexively enact such ways of reasoning. By more consciously participating in the ecology of postformal modalities—including thinking contextually, thinking dialectically, thinking critically and thinking complexly—AQAL could be reconfigured, and its metasystematic or crossparadigmatic *geist* could be appropriately furthered in service of the dialogic evolution of integral theory. This article has demonstrated a few uses of such postformal cognitive modes. Regard for all dimensions of embodiment and the metaphoric nature of theorising also need to be duly considered, whilst shadow-work can be fruitfully brought into the fabric of integral theory via the dialectics of deconstruction. Below is a concluding elucidation and possible futuring of these ideas—ends-in-view.

Identification of problems

In attempting to transcend postmodernism, Wilberian integral theory appears not to sufficiently include its contributions. AQAL's current theoretic status of the Green vMeme and its relationship to post-Green conceptualisations is substantively problematic. It would appear this has led to the memetic propagation of myths concerning integrality. The following points can be made.

1. From a vMemetic theoretic perspective, the Green vMeme (postmodernism and postformal thinking) is accepted most strongly by the subsequent Yellow (Teal / integral) vMeme and is rejected most strongly by the Orange vMeme (including modernism and formal thinking), and is also substantively rejected by the Blue vMeme (absolutist thinking). The *mean green meme* can most adequately be identified developmentally as an Orange vMeme perspective. Blue vMeme attitudes can also be associated with the *mean green meme* meme.
2. Gebser does not posit a structure of consciousness between the current *mental-perspectival* one and the emerging *integral-aperspectival* one; he does not identify a deconstructive postmodernism. He cannot therefore be legitimately used in service of AQAL theory in this regard.
3. Uncontextualised association between relativism, deconstruction and Derrida is constituted by substantive mythic elements. Derrida and déconstruction can be legitimately identified as operating from an advanced developmental level. Derrida's potential contribution to integral theory needs to be digested. The developmental maturity

and spirituality of postmodern philosophers such as Deleuze, Derrida and Lyotard need to be adequately addressed by integral theory.

4. There is an anomaly in current integral theorising regarding, on the one hand, the strength of the Green vMeme in the U.S.A. in relation to Europe, and on the other, the strength of the pathology of the Green vMeme in the U.S.A in relation to Europe. This might be evidence of a more endemic theoretic problem. Nation-cultures need to be more adequately addressed.

Summary of re-view

Integral theory itself can be used to address these points, thus effecting an autopoiesis. Specifically, the way to a respectful and internally consistent integral approach can be seen as being *through* the myriad features postmodernism offers, not in substantive antipathy to it. Re-viewing postmodernism from an integral perspective can enhance the adequacy of AQAL, leading to an integral theory which is more internally consistent and respectful.

Whilst appropriately including many and various contexts and dimensions with regard to formal reasoning, postformal reasoning includes substantively different types of cognition to formal thought, including—thinking complexly, contextually, creatively, critically, dialectically, dialogically, ecologically, "embodiedly," linguistically and reflexively. The reflexive enactment of such modalities may consequently alter the conceptual template—the very fabric—upon which integral theory is based.

A forward view

The primary intent in this article has been to open up particular conversations to further facilitate the appropriate evolution of integral theory. As such, the following could variously act as a guiding framework for further research.

Toward an explicitly linguistically-aware integral theory

A central feature of the postmodern developmental wave regards the significance of languaging. Integral theory should take this contribution to heart, deepening its enactment. Notably, reflexive embrace could be given to the following understandings concerning the languaging of theoretic narrative:

a. Its constructed qualities.
    i. Research could be undertaken, for example, with regard to possible relationships between the poststructuralist "linguistic turn," constructivism, and Cook-Greuter's "construct-awareness."
    ii. Developmental constructs and theoretic topologies could themselves be addressed through differentiating between the linguistic signifiers (such as "developmental *wave*") and the underlying topology or theoretic signifieds with which they are associated (for example, linear or non-complex topology).
b. Its metaphorical qualities.
    i. Research could be undertaken regarding the relationship of integral theory to Lakoff and Johnson's work on conceptual metaphor and embodied philosophy.

c. Its complex dialectical qualities.
    i. Research could be undertaken concerning the operation of complex dialectics at the micro-scale of concepts—"integral nanotextology."
d. Its poetic qualities.
    i. Further investigation could be undertaken with regard to the relevance of Gebser's poetic density of languaging for integral theory.
    ii. Further exploration of the relevance of Gangadean's novel typological syntax to integral theory might assist in the evolution of integral theory.

Theoretic narrative can be deepened through its participants (co-creating users, including you and me!) becoming more linguistically-aware—as demonstrated or gestured by the deepening of vision-logic offered in this article.

Toward an explicitly ecological (dialogic-critical-contextual) integral theory

Further research could be conducted in relation to the following various dimensioning contexts of ecological thinking:

a. Critical contexts[90] (contexts of compassionate imperatives), including
    i. Biospherical ecological contexts—at different scales of recursion, especially planetary.
    ii. Social justice contexts—at different scales of recursion. For example, the criticality of integral theorising could be addressed in relation to such power imbalances as those involving the over-extensions of Western, American, Orange vMeme, Anglophone or other hegemonic domains.
    iii. Other ethical, spiritual and futures contexts.
b. Conceptual ecological contexts
    i. Time—genealogies.
    ii. Space—geographies. Chinese integrals, Indian integrals, Spanish integrals, and so forth, could be identified as different *types* of integral, stemming from alternate genealogical threads.
    iii. Conceptual space—regarding both the conceptual ecologies in which *integral* may be appropriately identified (such as amongst *holism, integration, transformation, spirituality*, *planetary consciousness,* etc.), and the (more local) ecology of interpretive uses of *integral* itself (as demonstrated in this article).
c. Social ecological contexts—community-in-dialogue
    i. Voice-in-community—As part of acknowledging the potential role of my voice in this article in relation to the integral community, I have attempted to indicate certain openings to conversation and community dialogue. Further research here thus lies, in the next instance, beyond me.
    ii. Community-in-voice—I also acknowledge the community already *in* my voice, so to speak. I have multiple subjectivities; no-one can logically speak from a position of absolute authority. Consequently, I have attempted to allow a range of languaging here whilst variously maintaining a certain tentativity of tenor. There will necessarily be flaws in this text, so a space has hopefully been left in the

---

[90] See also Anderson (2006).

> fabric of my text for the involvement of the Other (such as that *you* might variously identify).[91]

As part of deepening critical awareness regarding integral theory, further research could be undertaken regarding a more comprehensive evaluation of the current situation than was within the scope of this article to conduct.

Toward an explicitly dialectical integral theory

Notions of *construction* and *deconstruction* as necessary adversaries can appropriately be seen to stem from an either/or mindset. Thinking dialectically, their relationship can fruitfully be rather understood as complexly interpenetrating. Deconstructive and reconstructive postmodernisms share one genealogy which itself has a dialectical underpinning. Hence contra-possibilities can be identified: that discourse under the mantle of deconstruction can be constructive and/or appropriate, whilst discourse under the guise of reconstruction can be destructive and/or inappropriate. Derrida's work should not be regarded as antipathetic to an integral approach. There is evidence regarding the maturity of Derrida's discourse; there is also evidence regarding a dissonance between the theoretic content of Wilberian theory and perspectives given toward that content by Wilber. Further research could be undertaken in these regards. Resultant conceptual bridges could further mutual understanding; and a greater, more cohesive (or paradoxically more stable) integral theory could result.

Paradoxical thinking is associated with dialectical thinking. For instance, other parts of my life[92] are not directly congruent with the sensibility expressed in this article. I sit with the paradox contained within the ecology of these different "lines."

Toward an explicitly complex-aware integral theory

I have demonstrated a particular use of the complexity theory element, *recursion*—with respect to both *content* and nonduality in integral theory. Further research could be undertaken with regard to other elements of complexity theory such as emergence, bifurcation, hysterisis, sensitivity to initial conditions, indeterminacy, attractors, and dynamism.

Both differences and similarities could be identified between different fractal scales of construction, such as the construction of theories and the construction of terms; both differences and similarities can be identified between different fractal scales of *de*construction, such as Derridean déconstruction and the deconstruction of the ego.

A conceptual template based in part on complexity theory could facilitate an internally-congruent evolution of integral theory. Further research could explore, for example, in what appropriate ways *pre-* and *trans-* could be identified as distinct yet complexly interpenetrating.

---

[91] As Edgar Morin (1999, n.d.) wisely points out: "The adventure remains unknown." One could add: each word is a venture.

[92] For instance, whilst I have been beavering away at this article, my body has suffered from insufficient exercise!

Toward an explicit, dynamically creative integral theory

AQAL places the concept of creativity as a core generic driver ("healthy" transcendence as characterised as Eros) in holonic development-evolution. Numerous theoretic perspectives on creativity could be given. One such perspective is that offered by Arthur's Koestler's (1970) triad of the Sage, the Artist and the Jester.

a. The Sage
    i. Research could be undertaken to facilitate a reflexively wise and compassionate integral theory.
b. The Artist
    i. Research into the *art* of integral might investigate the artfulness involved in all dimensions of participation.
    ii. Research could explore bringing more beauty into the good and true.
c. The Jester
    i. Ludic research could explore the transition from *boomeritis* to *bloomeritis*!

As Wilber (2000a, p. 3) says, "choose your big pictures with care."

Acknowledgement

I am indebted to my mentor and fellow postformal researcher, Jenny Gidley. Our ongoing, passionate dialogues are co-inspiring, our ideas frequently co-arising.

Appendix A: The Green vMeme Attractor: Big Mind, Kind Heart, Healthy Hierarchy

In an Integral Naked advertisement originating from Wilber's Integral Naked website (Integral Institute & Davis, 2007), the following assertion is made concerning the Virginia Tech massacre:

> Ken points out how extreme postmodernism (boomeritis, mean-green-meme) has contributed to an atmosphere in which…the two developmental waves responsible for most terrorist acts…are allowed and even encouraged to flourish. What's needed is…[an] AQAL toolbox with which to be able to prevent, recognize, and effectively address malevolent and terrorist activities. Of particular interest to scholars will be Ken's discussion of the difference between a merely **deconstructive postmodernism** a la Derrida, and a **genealogical/developmental postmodernism** a la Foucault, which paves the way to an Integral view, rather than blowing up the road. (§ *Scholar's Notes (for Advanced Students and Curious Listeners)* ¶ "Postmodernism," emphasis in original)

The explicit foregrounding of association between and the worst U.S. tertiary education massacre in history on the one hand, and Derrida on the other—via a (metaphorical) inference that Derrida *blows up roads*—perhaps indicates something of the nature of the propagation of the *mean green meme.* One might be tempted in this instance to proffer two questions: (a) Could the above advertisement be described as a "vulgar" or even "nihilistic" attack on Derrida? and—in the spirit of furthering inquiry into collective shadow-work—(b) Mirror, mirror on the wall, who is the meanest of them all?

I shall explore such questions by investigating evidence concerning the Green vMeme and its alleged "meanness."

Is *the* M*ean Green Meme* Construction a Mythic Meme?

A significant feature I have noticed in my ten or more years of research into Wilber's work is that there is a significant emotive dissonance between, on the one hand, Wilber's substantive focus on the negative aspects of the Wilberian Green vMeme (substantive in the sense that there is significant repetition and intensity of theme, and that such repetition-and-intensity is not given to any other vMeme by name) and, on the other, the emotive void caused by theoretic over-generalisation—in Wilber, in certain other texts, and in the integral community at large. An example of such text is evident from two quotes from an article in a new journal grounded in Wilberian philosophy. The first:

> One of the main reasons why there is such a thing as Integral Studies, Integral Theory, Integral Psychology, Integral Business, Integral Consciousness Studies, and Integral Art can be understood in terms of multidimensional, multi-level thinking and, furthermore, *being.* As already mentioned, this is what Gebser calls *integral-aperspectival,* what Wilber calls *vision-logic* and what Beck calls *Second-Tier*(Saiter, 2005, ¶ 10).

And the second, regarding,

> a ‘higher’ order of thinking (as in Wilber's vision-logic). As already mentioned, Jean Gebser uses the term(s) ‘integral/aperspectival’ to refer to a similar state of high comprehension. Don Beck follows suit when he describes the manifestation of Second Tier thinking starting with the Yellow vMeme” (Saiter, 2005, ¶ 14).

In both these quotes, the Green vMeme is ignored.

Is vision-logic partly constituted by the Green vMeme? Is aperspectivality partly constituted by the Green vMeme? Is Second-tier partly constituted by the Green vMeme? If the answers are equivalent, this question might be of minor consequence. But the answers are not equivalent. Wilber’s vision-logic *is* partly constituted by the Green vMeme; Spiral Dynamics’ second-tier is not; whilst the Green vMeme is not addressed in Gebser’s aperspectivality (Gebser’s work predates Spiral Dynamics). If the Green vMeme had not been given special treatment by Wilber, then such lack of care as exemplified by these statements might, again, be of minor consequence. But Wilber has emotively set up a deep conceptual division precisely in this liminal territory, a division which is magnified by his popular appeal in the community—and power base (see Appendix C)—so that such a device could divisively begin to assume a mythic (dismissively-defended, under-analysed) status.

Such notion of an under-analysed but virulent *myth of Integral* would be supported by the following casual perusal of an Integral Institute discussion forum on the “koolest” website, *zaadz*. By way of explanation regarding the basics of AQAL, Julian Walker (2007) enthusiastically introduces the audience to Wilber’s *Pre/Trans Fallacy* by way of drawing a chart constituted by three levels: (a) “Preconventional; Prerational; Archaic/Magic/Mythic; Sensorimotor/preop; Purple/Red/Blue” (b) “Conventional; Rational; Rational; Concrete Operations; Orange/Green” (c) “Postconventional; Transrational; Integral; Formal Operations/Vision Logic; Yellow/ Turquoise” (see Table 1).

Table 1. Walker’s Chart

Preconventional	Conventional	Postconventional
Prerational	Rational	Transrational
Archaic/Magic/Mythic	Rational	Integral
Sensorimotor/preop	Concrete Operations	Formal Operations/Vision Logic
Purple/Red/Blue	Orange/Green	Yellow/Turquoise

Numerous fallacies and misplacements are given even in this simple schema. These include the equating of “Formal Operations” with both “Postconventional” and “Vision Logic,” rather than with “Orange” / “Rational.” The most extreme is the conflation of “Green” with “Concrete Operations”—a misalignment—to Green’s disadvantage—by a whole *two* stages. This, indeed, would be something toward the *antithesis* of Wilber’s *Pre/Trans* iteration—namely, this young teacher’s thinking that the Green vMeme was *pre-rational* when in fact it is *post-* or *trans-rational*.[93]

---

[93] I am using “transrational” to denote a sublation (*trans*cending-and-including) of *rational* rather than to make a distinction between *transrational* and, say, *postrational*. This usage I am making here is congruent with the categories identified by Walker.

Of course, any student can get details wrong about anything they are learning, or even, unfortunately, about anything they are passing on to others as (informal) teachers. The specific discussion here, though, would concern the possible perpetuation of misunderstanding not through a student's failure to understand something correctly, but because the more experienced teacher's text was itself already confused, conflated, inflated. Wilber's communication that the Green vMeme *transcends the rational* occurs substantively less frequently and less emotively than his stress on the idea that *the Green vMeme is pre-rational—regressive*—and/or *pathological*. As our specific hermeneutic interest here would concern the issue of an inappropriate attack on Green, suspicion would surely be raised by such evidence, and a hypothesis could be posited concerning, let us say, *the Green/Yellow Fallacy*.

Following on from the parting of company between Beck and Cowan, Cowan has been a keen supporter of maintaining the authenticity of Clare Graves' work, on which Spiral Dynamics was originally based. He has furthered this work with new colleague, Natasha Todorovic. Her (2002) research into the Wilberian Green vMeme reinforces this suspicion. She statistically analysed data from over 600 profiles and found the following.

1. "Blue/Orange tends to avoid ambiguity by simplifying interactions into narrow categories" (p. 5)
2. "Individuals centralized in Blue, Orange and the Blue/Orange pairing appear to have a stronger tendency than other systems to reject the Green vMeme" (p. 2)
3. "It is those with high Orange scores who reject Green most strongly" (p. 3)
4. "Those centralized in the Yellow system reject statements describing the D-Q (Blue) system most strongly—NOT Green" (p. 3)
5. "Yellow accepts green more than any other system" (p.3).

She also notes that

6. Clare Graves had modified his view from "monumentous leap" between Green and Yellow to seeing them as more alike than he had previously realized (p. 3)
7. There is no evidence of substantive Green/Red pairing. In fact, "the data shows that when Green increases so does the rejection of Red" (p. 6)
8. There was a significant "yellow false positive" whereby "Selection of statements intended to elicit Yellow appear to be reflecting a more sophisticated form of Orange instead" (p. 3), and that,
9. "The dominant profile for those pegging falsely on Yellow came from the Blue/Orange pairing and from Nodal Orange" (p. 3). In regards to this, she says that, "this might explain much of the 'second tier' elitism coming from MGM [mean green meme] advocates. The Blue need to rank order combined with classism and right thinking minds at Orange, results in a drive to convince self, and others, of living at 'second tier' (if such a thing actually exists!)" (p. 3).

I think it is notable that a scholarly researcher investigating Clare Graves' original data should doubt whether "second tier" actually exists. What justification could there be in the propagation of myths concerning second tier when detailed research problematises such type of propagation?

Coining the term, “Meme-ism”, as a form of spiral classism, Todorovic comments that, “the spread of terminology like MGM has weaponized the previously neutral SD colors and opened the door to prejudice, even hatreds…” (p. 10). She concludes that,

> the most objectionable example of the MGM label in action has been as a capricious stereotyping tool. … This results in intimidation and promotes a habit of labelling then dismissing detractors with negative words wrapped in spiral dressing.
> MGM artificially closes doors to understanding. Inquisitors wield MGM as a
> coercive tool, forcing critics into defensive positions where they must either recant or be diminished through cheap name-calling. It diverts focus from the object or idea under investigation and shuts down important debate (p. 10)—

such debate as this article seeks to facilitate. In so doing, my intention would in no way be to problematise *all* problematisations against the Green vMeme—whether as an entire construct or in terms of its possible constituents—but to draw attention to its problematic use in a non-contextualised, and non-construct-aware fashion, and specifically to point to some—potentially—major theoretic obstacles to its employment as an “orienting generalisation.”

The wordplay “mean green meme” first appears in its own section in *A Theory of Everything* (Wilber, 2000c, pp. 122-125) in which Wilber quotes Beck (unreferenced) as saying, “green has introduced more harm in the last thirty years than any other meme” (p. 123). Wilber takes this to mean: “a culture that tries to ram pluralism and multiculturalism down everybody’s throat is going to come apart at the seams faster than you can say ‘deconstruction’” (p. 123-124). His claim is that Green has damaged Blue infrastructures by way of quoting George W. Bush regarding, “the soft bigotry of lowered expectations.” He speaks harshly of “the highly developed postformal [sic] green wave” which champions “any and every ‘multicultural’ movement;” and of “order-Left imperatives commanding everybody to be sensitive;” of the “nihilism and narcissism of extreme postmodernism;” of “the harsh intolerance of the politically correct thought police;” and says that, “the green meme has been in charge of academia, the cultural elite, and much of liberal politics for the past three decades, but it is now being challenged on all sides” (p. 122-125).

What should be my response to all this? As a concerned global citizen I should surely feel stirred by such righteous indignation; I should surely join a crusade against such evil. Yet, as a non-American, I am unclear as to what precisely he is referring: I have witnessed “mean” actions from some people, for instance, but they’ve tended mostly to be from dog-eat-dog or man-eat-man corporate careerists (if one had to coin a phrase) rather than liberal academics. And I can’t recall that I’ve ever had anything unpleasant *rammed down my throat*—at least, not to my knowledge! Moreover, as a novice liberal academic myself, I wonder whether I am unwittingly part of a nihilistic cult? Indeed, is *this* very article a highly developed but covertly narcissistic *command* to be “green-sensitive”?

But sadly, Wilber offers not one piece of evidence in this section on the “meme green meme” and so I am left none the wiser, though a tad more fearful.

A Discourse Analysis

The following discourse analysis below addresses the contents of the three pages constituting the last section of the first chapter of *A Theory of Everything*, entitled, “The jump to second-tier consciousness" (Wilber, 2000c, pp. 13-16). From my research on Wilber, I consider this to be sufficiently indicative of Wilber's general perspective toward the Green vMeme for the consideration below.

Green vMeme Features Identified

Wilber identifies the following features of AQAL's Green vMeme. (This analysis also indicates the number of respective repetitions of these features within the text in question; and categorisations used for the associated Table 2 are given in parentheses).

- Features framed as substantively negative
  - "Narcissism," "subjectivism," "boomeritis" (narcissism)—10
  - Fighting or "accusing" higher developmental levels—such as against "holism" (competitiveness)—5
  - Inefficiency (inefficiency)—3
  - Competitive nature (competitiveness)—2
  - Expression of feelings (other)—1
  - Deconstruction (narcissism)—1
  - Inverted values (as in, "bend[ing] over backwards" to accommodate)—(other)—1

- Features framed as substantively partial
  - "Pluralism," "relativism" and "pluralistic relativism" (pluralism, relativism)—15
  - Items related to the above—inclusivity, non-universalism, diversity, multiculturalism, antihierarchy, egalitarianism, anti-marginalisation, avoidance of exclusion, redress of social imbalances (pluralism, relativism)—12
  - Nobility (e.g., "noble intent") (other)—2
  - Individualism (other)—1

- Features framed as substantively positive
  - Compassion, sensitivity, care (compassion)—4
  - Civil rights (civil rights)—1
  - Convincing philosophical critiques (worthy text)—1
  - Environmental protection (environment)—1
  - Richness of text (worthy text)—1

This is summarised in Table 2 below.

Table 2. Wilber's Green vMeme identifiers (based on the text analysed)

Identifier	Occurrences in text
Pluralism, relativism	28
Narcissism	10
Competitiveness	7
Compassion	4

Inefficiency	3
Worthy text	2
Civil rights	1
Environmentalism	1
Other	7

A Contrasting Perspective on the Green vMeme

Whilst it is beyond the scope of this current presentation to conduct a comprehensive contextualisation of AQAL's Green vMeme (as indicated above), it nevertheless behoves me to present a certain contrasting perspective as a point of departure for further research.

Noting that the Green vMeme denotes a memetic attractor regarding "green values," it would seem to be an adequate "orienting generalisation" to employ a similar methodological *tenor* to that of Wilber (as previously described in this article). I thus turn to the Wikipedia for an "ordinary-yet-informed" perspective on what *green values* might signify.

Searching Wikipedia for "green values" produces 4 main results, each of which refer to the values of Green political parties. From this, two main sets of values are readily apparent—one from the U.S. Green Party (2000), and the other from general guidelines from European Green Parties.

The ten key values of the U.S. Green Party are

- Grassroots democracy
- Social Justice and Equal Opportunity
- Ecological Wisdom
- Non-violence
- Decentralization
- Community-based economics and economic justice
- Feminism and gender equity
- Respect for diversity
- Personal and global responsibility
- Future Focus and sustainability (Green Party of the U.S., 2000)

The "four pillars" of (many of) the European (and other) Green Parties are

- Ecology
- Social Justice
- Grassroots Democracy
- Non-violence (Wikipedia, 2007b)

It is clear from this presentation that there is no significant correlation between the two sets of articulations of Green values—those by Wilber and those by Green parties.

Whilst Green parties would obviously not intentionally present any negative aspect of Green values (and therefore, a discussion regarding Wilber's critical hypothesis regarding narcissism and inefficiency, for example, could not be directly contextualised here), the contrast to the Wilberian Green vMeme is nonetheless striking.

Firstly, Wilber mentions “environmental protection” only once among the 61 items identified. This is, of course, in contrast to both the popular conception of Green values (where the environment would be identified as the major feature), and it also contrasts the sets of values by Green parties—again, where ecology / ecological wisdom is a major feature. Specifically, it constitutes 25% of *the four pillars*, whilst in *the ten key values* it is given approximately the same weight (the totality of “ecological wisdom,” a major share of “future focus and sustainability,” a share of “personal and global responsibility” and, perhaps mootly, “respect for diversity”). This orienting generalisation contrasts markedly to 2% identified in the analysis of Wilber’s text.

The next feature from Green Party values concerns social justice and economic justice. This term infers the ethics of considering others’ welfare. Wilber does not use this term. He refers to “civil rights” once (2%). He also refers to “diversity” once (2%)—a contrast to the clearly specified “respect for diversity” in the ten key values (10%).

Grassroots democracy, decentralisation and community-based considerations are identified as major players in Green Party values (25-30%), but Wilber does not address this dimension in any way.

Non-violence is also identified as a major Green Party value (10-25%). This contrasts with Wilber’s identification of the feature of “aggressive competitiveness” of the Wilberian Green vMeme (notably with regard to other vMemes).[94] (Although plausibly, the theoretic relationship between these opposites could perhaps be seen as dialectical—aggressive competitiveness being the shadow of non-violence).

It is notable that Wilber does not directly identify personal and global responsibility as a Green value. It is also notable that Wilber does not regard Green’s ethical futures-orientation.

Apparent, too, is the contrast between Wilber’s significant repetition of the terms, “pluralism” and “relativism” and the lack of use of these terms by the brief text above regarding Green parties values. Of course, “pluralism” and “relativism” can be adequately regarded as *philosophical* terms, and Green party values may not be framed in this manner. A more detailed hermeneutical analysis would therefore need to be conducted with regard to *pluralism*—in reference, for instance, to

1. The apparent core *raison d’être* of AQAL (in Wilber IV) to move “beyond pluralism” (Wilber, 2000c, p. 29),
2. Wilber’s recent (Wilber V) use of the term in his “Integral Methodological Pluralism” and
3. Such substantive considerations as being mindful of the relationship between anti-pluralism and totalitarianism (Montuori, 2005).

Regardless, Wilber’s “orienting generalisation” toward the Green value-Meme attractor is substantively different from the orienting generalisation of the Wikipedia public’s perspective on green values. The Green value-Meme attractor can, instead, be seen to be constituted by a philosophic vision of planetary wisdom (which could be characterised as "big mind,"), a substantive spirit of compassion ("kind heart") and a hierarchy of values which clearly prioritises ethical considerations above egocentric financial gain and other vanities ("healthy hierarchy").

---

[94] Wilberian theory variously infers and asserts that Green values aggressively fight against Wilberian-identified higher levels of development, including particular dimensions of spirituality (see, e.g., Wilber, 2006b). It could be argued, however, that many spiritual approaches align most strongly to Green values. By substantively foregrounding the Green vMeme as narcissistic and a major facilitator of global terrorism (see the Wilber-approved quotation associating addressing Derrida with terrorism above), is Wilber then inferring that the Quakers, for instance—whose approach can be reasonably seen to align with the four pillars of the Green party—are significantly associated with, or constituted by, such a *terror-inducing* meme?

Referencing

In the analysed section of Wilber's text, the following references are made.

Wilber refers to Beck / Cowan / Graves research (Spiral Dynamics) three times. I note that Wilber has since distanced himself from Spiral Dynamics, yet incongruently still substantively discusses (a) "memes" and (b) the generic distinction between "first" and "second-tier" thinking, a distinction which Cowan and Todorovic have indicated is substantively contra-indicated by Clare Graves' later work. When he is discussing such phenomena, is Wilber still referring to Spiral Dynamics or not?

In the analysed section, Wilber also refers to Colin McGuinn (1977) once. This is made via reference to Wilber's *One Taste* (2000b). Through this, the reference Wilber uses to critique *academia* (*in toto)* is from *The New Republic,* which is (a) a magazine, (b) politically neo-liberal, and (c) American.

Comments regarding mode of participation

Wilber (2000c) states that "'cross-level' debates are rarely resolved" because "no amount of scientific evidence will convince blue mythic believers; no amount of green bonding will impress orange aggressiveness; no amount of turquoise holism will dislodge green pluralism" (p. 14).

The last point associates holism with the Turquoise vMeme as a contrast to the Green vMeme, yet holism is also one of the core features of the Green vMeme.[95] For example, in accordance with AQAL theory, Sean Esbjorn-Hargens implies that "integral" education (signifying *education theory derived from AQAL*) is developmentally beyond *holistic* education (Esbjörn-Hargens, 2006), inferring holistic education is a Green vMeme approach. AQAL theory would be doubly problematic here in that Scott Forbes (2003) has argued in his seminal work on holistic education that the very *raison d'être* of holistic education is "Ultimacy" (p. 17) a concept sustantively founded on a developmental hierarchy approach—an approach that AQAL substantively posits as antithetical to the Green vMeme.

With regard to the second point, my primary intent in this discourse analysis (or, indeed in this article as a whole) is not to engage in interpersonal bonding; this analysis cannot therefore be attributed to the Green vMeme as per Wilber's comments above. Rather, I am conducting an analysis, which infers the Orange vMeme of Wilber's first point (regarding "scientific evidence"). As such, if one presumes the legitimacy of Wilber's comment, then if this current analysis fails to "convince" the reader, then the reader might well be operating at a Blue vMeme level in this regard—consequently strengthening the plausibility of mythic belief within the integral community. (Of course, Wilber's comment might be misplaced, in which case the above deduction would not be applicable).

---

[95] Wilber differentiates *integral* as a holonic/hierarchical type of holism from *Green* as a "flatland," "monological," non-holonic/hierarchical type of holism, (e.g. Wilber, 2000c, pp. 30-31) but does not directly evidence the substance of this connection between *green holism* and *antihierarchy*.

An end-in-view

Pending adequately referenced critical contextualisation, there is thus sufficient evidence to suggest the contra-indicative plausibility that (a) the memetic construction, *mean green meme*, is substantively mythic (transmitted more by the emotive dogma of received opinion than via the reflexivity of balanced reason), and (b) an alternate characterisation of the Green vMeme could be coined as, “big mind, kind heart, healthy hierarchy.”

Appendix B: The Seduction of Formal Academic Expectations

The seduction of formal academic expectations may have led to the following consequences:

1. My foregrounding of difference to, or differentiation from, Wilber's approach in this article. Whilst this has its merits, it may not sufficiently express the commonalities I might share, nor adequately convey my appreciation of Wilber's panoramic vision and courage. If this is so, I apologise. It is work-in-progress (and, in my defence, the purpose of this article is not to comprehensively address Wilber's work but rather to explore in detail a certain—problematic—territory within it). I look forward to pertinent community dialogue, analysis, deconstruction.
2. Languaging which is less dialectical or deconstructed than I might otherwise have desired. Specifically, my authoring "voice of authority" is privileged over the voicing of uncertainty, tentativity, Mystery, Other.
3. An overall structure which is less complex and more linear than I initially believed would be congruent with my "content chunks."
4. A de-emphasising of artistic and ludic dimensions.

Nevertheless, I have attempted to retain expression of:

1. A moderate variability in voicing—among various formal and non-formal (particularly postformal) modes.
2. A subliminal encouragement, perhaps, for the reader to *slow down* through the punctuation afforded by "generous" footnoting—such slowing being congruent with both the learning afforded by hermeneutic circling (or helixing) and also with the (e.g. Derridean) questioning of the default formal privileging of writing-as-speech above writing-as-writing.
3. A certain allowance or toleration of the loose, fuzzy and open-ended, amidst a formal textual landscape of the privileging of the tight, clear, and "buttoned-down."

Furthermore, lest it be imagined that I engaged in an idealistically formal process in the researching and writing of this article—setting out with totally clear ideas about what I wanted to do and then methodically working my way to achieving them—I present the following points and musings.

1. This article was originally submitted to *Integral Review* as "Interpenetrating Integral and Postmodern Liminalities" and, compared to the current article, had more of an artistic experimental flavour, in my striving for an honouring of Arthur Koestler's (1970) *Jester-Sage-Artist* creativity triad. Due to *Integral Review*'s wisely innovative submission process, however, whereby an initial editorial review is offered prior to formal peer-review, it was clear that the readership, in the first instance, would probably benefit more from a contribution in which the theoretic is foregrounded. Consequently, my "hermeneutic hovercraft" was vacated (!), my poetic density decimated and a more formal structure instituted.
2. One perspective on my process can be identified as a complex dialectic between reason and intuition. The sharp left brain requires the fuzzy right brain; fragrant roses require

smelly manure; and certain method requires a certain madness. Apropos, /technologies/ and their theoretic counterparts reside *within* ((human complexity)), not *vice versa*.

Appendix C: An AQAL Contextualisation

A core concern of Wilber's is the evaluation of the writing of others with respect to the degree to which they have addressed the AQAL dimensions of quadrants, levels, lines, states and types. Certain designations are then given by him, notably whether the writing is "integral"—connoting *full approval by Wilber*—or not; or whether the writing is "integrally-informed," connoting *partial* approval.

I offer the following contextualisation to indicate my particular address of these AQAL dimensions. Given the conclusions of this article, however, it would seem that a new designation of "integrally-*informing*" might be in order—connoting attempts to assist in the cohering and evolution of integral theory.

Eight Native Perspectives (in Quadrants)

1. Upper Left Inside—I have foregrounded somewhat the concept of reflexivity (and its connotations of "know thyself") in this article. I have also offered some personal self-reflections—see, for instance, Appendix B, and the current Appendix. I have attempted, however, not to fall prey to the Wilberian critique of (Green) subjectivism
2. Upper Left Outside—(a) It could be argued that a main object of inquiry in this article—namely, AQAL—is a form of structuralism. (b) Could poststructuralism be fruitfully regarded as sublating (transcending and including) structuralism?
3. *Upper Right Inside*—I have attempted to enact an autopoiesis.
4. *Upper Right Outside*—An important marker of objectivity is careful attention to the details of the phenomena under investigation. With regard to physical phenomena, the procedures and particularities of scientific experiments facilitate such rigour. With regard to noospheric phenomena or noospheric signifiers of physical phenomena, the rigour concerning the discussion of ideas is facilitated in part by the procedures and particularities of scholarly conduct, including referencing. In this regard, I have attempted to reference adequately. I have also attempted to indicate where Wilber has potentially suffered through not employing such evidential rigour.
5. *Lower Left Inside*—I have attempted to weave hermeneutic considerations into the very fabric of this text.
6. *Lower Left Outside*—Further research could be undertaken regarding the propagation of mythic memes within the integral community.
7. *Lower Right Inside*—I am attempting to facilitate a social autopoiesis within the integral community.
8. *Lower Right Outside*—(a) If we regard *global* power structures, then we need to substantively address such identifications as (i) hegemonic / homogenous globalisation (ii) the critical (and shadow-forming) overextension of the Orange vMeme; capitalism; instrumental rationality; the United States' current unique global positioning. (b) If we regard the current global influence of *ideations*, then we could regard both *integral* and *postmodernism* as underdogs, (c) If we regard *integral theory*, then we should address the dominant power position of AQAL across many contexts. In this regard, I note the following:

Power base of the six major genealogical memes whose identity is in substantive relationship with the term, *integral*

—as identified by the following analysis which shows number of texts (articles, etc.) which cite the first 20 pertinent listings identified by Google Scholar[96] via the following phrase:

- Integral “Rudolf Steiner”: 21
- Integral “Ashok Gangadean” 39
- Integral “Jean Gebser”: 71
- Integral "Ervin Laszlo": 72
- Integral “Sri Aurobindo: 100
- Integral "Ken Wilber": 577

Levels

I have taken AQAL developmental levels as a substantive object of inquiry—notably Orange, Green and Yellow/Teal, and have adopted a developmental approach with regard to them. I have also demonstrated a particular usage of developmentalism toward (a) discourse (b) conceptual templates regarding theoretic narrative. To this degree, I have valorised developmentalism. I have also inferred particular value in the construct of *holarchy*.

I have made use of numerous AQAL-identified postformal modes of cognition, such as dialectical operations and complex-aware thinking, in addition to formal reasoning.

I have also made substantive use of text from the following authors—some of whose research form important aspects of AQAL theory (including *Wilber V* AQAL), namely, (a) the cultural theoretic narrative of Jean Gebser; and (b) the developmental models of Susanne Cook-Greuter, Jenny Wade, and Spiral Dynamics (the latter with regard to e.g. (i) “memes” and (ii) “first-tier” / “second-tier” distinction).

I have valorised *vision-logic*.

I have also valorised certain postformal developmental perspectives—including those of theoretic narratives Wilber calls upon with regard to post-Orange levels. I have nevertheless substantively problematised (from different angles) *AQAL* theory regarding *that which lies beyond Orange*, notably regarding the theoretic narrative around the Green / Teal (a.k.a. Yellow) transition.

Lines

Could the following be fruitfully regarded as lines:

- Perspectives on postmodernism?
- Methodologies?
- Postformal cognitive modes?
- Nonduality?
- Deconstruction?

How might *interrelationships* between lines be adequately conceptualised? As conceptual ecologies?

---

[96] Retrieved 27 May 07

What might the relationship be between *lines* and poststructuralist *subjectivities* (if we consider the bridging concept of *subpersonalities*, for example)?

States

I have identified *neo-imperialism* as a possible cultural *state* (from a lower right perspective). What other *states* might be identified in the lower quadrants?

The research process necessarily involves a host of gross, subtle and affective states. I particularly note entering creative *zones*; and also the alternation of active and passive states—such as in Otto Scharmer's (2005) *Theory U*—across surprising timescales. Passion is a major mover for me. So is intuition.

Types

It might be helpful to regard global language regions—such as the Anglophone world—as a form of lower left *types*.

Perhaps postformal cognition modes can be regarded as *types* of cognition (at the postformal level).

I type the following: *I suspect I might be the type of person that loves to type.* ☺

Editorial

A Time of Transition

As we welcome you to the fifth semi-annual issue of *Integral Review* (IR), I would like to point to signs that mark a time of transition for this journal. Some are small, like shifting our table of contents headings to more clearly identify which works are peer reviewed, and changing the spacing between articles' paragraphs. Others are more obvious, like the ability and willingness to publish even longer works than previously, in addition to the ongoing array of works published. Some transitions are in process and less visible. For example, we are working to evolve IR's structure to reflect its degree of engagement from others, and making behind the scene shifts in our ability to better understand and realize the goals we set out to accomplish. We believe we are also becoming more effective in articulating for ourselves and to authors what is required for their work to make significant contributions to the discourse we are supporting (resulting in the publication of fewer peer reviewed articles in this issue). My naming this as a time of transition also reflects a sense of growth in the community of conversation which we are a part of, and how I perceive what lies beyond the horizon.

This feeling of transition arises from several sources. One is seeing the growth in the number of submissions over a broader range of topics that reflect an evolving quality of discourse. Another is seeing submissions begin to draw on and integrate work from past IR articles, furthering the cohesion and coherence of formal discourse within the journal. In essence, there is a feeling of maturation, and there are many signs of growth for the future.

We at IR like to see our mission, (to publish material that applies developmental approaches and employs metasystematic or other stages of integral thinking in the process of doing so), shared by others. One such instance that we are aware of is forthcoming in IR Advisory Board member Ervin Laszlo's journal, *World Futures: The Journal of General Evolution.* With Michael Commons, IR editor Sara Ross is co-editing a special issue invited by *World Futures* on postformal thought and the Model of Hierarchical Complexity, a general theory of development. We look forward to seeing the issue come out in 2008.

Another effort with a mission that resonates with IR's is the emerging field of Integral Studies, which is showing important signs of maturing. I want to congratulate Sean Esbjorn-Hargens and his crew at John F. Kennedy University (JFKU) for gaining formal WASC accreditation (the Western Association of Schools and Colleges, the formal peer review accrediting body for higher education in California) for their new Masters in Integral Studies program. It would be hard to overstate the significance of this accomplishment, and it establishes a basis for bringing greater degrees of academic credibility to Integral Studies.

Another outgrowth of this work is the hosting of a conference, next summer, on Integral Theory by JFKU and Integrate Institute – http://www.holons-news.com/node/86. I know that some of us from IR are planning to participate, and we look forward to meeting some of our

SOME RIGHTS RESERVED

readers at the conference. These events signal transitions in this community, which is one of those served by IR.

While there is transition and maturation in the air, there is also continuity. Our readership continues to grow steadily, and we are heartened by supportive feedback from many quarters. We are also having a very active discussion in our online forum of Gary Hampson's article from the last issue. While it is an invited forum, visitors can look through the postings here - http://global-arina.org/phpBB/index.php. These forums provide an opportunity to explore topics from IR articles in more depth and engage authors about their work. We are happy to be supporting an active and ongoing community of conversation in this way.

As before, part of our goal is to foster transdisciplinary discourse and critical public dialogue on issues of relevance to our mission. Thus IR invites responses to and reviews of articles, books or other works published in IR and other journals, including AQAL. We hope this contributes to cross-fertilizing new thought, research, and praxis for healthy change and development in our societies and relations.

On the Contents of Issue 5

We begin this issue with what is in many respects a groundbreaking contribution to our understanding of the evolution of consciousness. Jennifer Gidley's *The Evolution of Consciousness as a Planetary Imperative: An Integration of Integral Perspectives* is both a panoramic and an in-depth examination of the evolution of human consciousness drawn primarily from the perspectives of Rudolph Steiner, Jean Gebser and Ken Wilber. Her hermeneutical analysis and integration of their writings on this subject weave a rich and rigorous picture. The scope of this work also covers a range of related fields. We think it sets some strong foundations for moving academic discourse on the evolution of consciousness. Further, the conclusions emerging from this "integration of integrals" offer a tremendous sense of the opportunities for transformation that integral consciousness offers. We are very pleased to publish this monograph and its three equally rich appendices.

Next, Martin Matuštík offers an essay on *Towards an Integral Critical Theory of the Present Age*. This piece builds on work done by past philosophers such as Habermas to identify a three-pronged model of material, socio-political, and spiritual critique of the present age. His model of an integral critical theory offers a way to transcend views that would limit discourse in these domains: he shows how appropriate critiques can be brought to each domain of human needs. This results in showing alternatives to current attitudes that can enable us to address current issues better.

My contribution to this issue of IR is in the form of a lengthy overview and response to Otto Scharmer's book, *Theory U. Leading from the Future as It Emerges. The Social Technology of Presencing*. The overview is intended as a sort of a "Cliff Notes," or highlight version of the book, as well as to entice readers to experience it for themselves.

This is followed by a short reflective essay from Josef San Dou, *Sent to Play on the Other Team*. This piece illustrates how a developmental view along with a different philosophy can make a difference in the lives of children engaged in youth sports. The lessons drawn from the experience are also shown to apply to a wider set of situations in life.

Art and the Future: An Interview with Suzi Gablik by Russ Volckmann continues his series of unique interviews for IR. This conversation covers a wide range of topics related to Gablik's art and art critic career, venturing into the area of integral theory and its potential to help us understand the current world situation. Gablik also challenges us to be realists and walk the fine line between unwarranted optimism about the future and cynical pessimism.

Jan Inglis presents a brief examination of how one area of public discourse is struggling to evolve. In *Reactivity to Climate Change*, she demonstrates that while the content of conversation around climate change appears to have shifted, the underlying structure of the conversation has not. Her examples clearly illustrate how this phenomenon is stuck in a dualistic dynamic, and Inglis offers a possible way forward.

The issue concludes with a collection of short contributions from IR editors. Over the past three years we have learned a great deal about our craft and our roles in helping shape public discourse related to transdisciplinary and integral approaches to theory and practice. Various conversations among us led to realizing that readers, authors and potential authors might find it interesting to hear some of things we individually think about as we reflect on our work with IR.

As *Integral Review* continues through this time of transition, we invite you to engage with us in all the venues we provide: reading and sharing the journal with friends and colleagues, providing feedback and/or participating in our online forums, volunteering as external reviewers, and of course submitting your contributions for publication. We appreciate the continued support that we have had, and look forward to the future.

Sincerely,

JReams

The Evolution of Consciousness as a Planetary Imperative: An *Integration* of Integral Views

Jennifer Gidley

Abstract: In this article I aim to broaden and deepen the evolution of consciousness discourse by integrating the integral theoretic narratives of Rudolf Steiner, Jean Gebser, and Ken Wilber, who each point to the emergence of new ways of thinking that could address the complex, critical challenges of our planetary moment. I undertake a wide scan of the evolution discourse, noting it is dominantly limited to biology-based notions of human origins that are grounded in scientific materialism. I then *broaden* the discourse by introducing integral evolutionary theories using a transdisciplinary epistemology to work between, across and beyond diverse disciplines. I note the conceptual breadth of Wilber's integral evolutionary narrative in transcending both scientism and epistemological isolationism. I also draw attention to some limitations of Wilber's integral project, notably his undervaluing of Gebser's actual text, and the substantial omission of the pioneering contribution of Steiner, who, as early as 1904 wrote extensively about the evolution of consciousness, including the imminent emergence of a new stage. I enact a *deepening* of integral evolutionary theory by honoring the significant yet undervalued theoretic components of participation/enactment and aesthetics/artistry via Steiner and Gebser, as a complement to Wilber. To this end, I undertake an in-depth hermeneutic dialogue between their writings utilizing *theoretic bricolage*, a multi-mode methodology that weaves between and within diverse and overlapping perspectives. The hermeneutic methodology emphasizes interpretive textual analysis with the aim of deepening understanding of the individual works and the relationships among them. This analysis is embedded in an epic but pluralistic narrative that spans the entire human story through various previous movements of consciousness, arriving at a new emergence at the present time. I also discuss the relationship between these narratives and contemporary academic literature, culminating in a substantial consideration of research that identifies and/or enacts new stage(s) or movements of consciousness. In particular, I highlight the extensive adult developmental psychology research that identifies several stages of *postformal thinking,* and recent critical, ecological and philosophical literature that identifies an emerging *planetary consciousness.* In summary, my research reveals an interpretation of scientific and other evidence that points beyond the formal, modernist worldview to an emerging *postformal-integral-planetary* consciousness. I posit that a broader academic consideration of such an *integration* of integral theoretic narratives could potentially broaden the general evolution discourse beyond its current biological bias. The article concludes with a rewinding of narrative threads, reflecting on the narrators, the journey, and the language of the discourse. Appendixes A and B explore the theoretical implications of the emergence of postformal-integral-planetary consciousness for a reframing of modernist conceptions of time and space. Appendix C holds an aesthetic lens to the evolution of consciousness through examples from the genealogy of writing.

Keywords: Aesthetics, evolution of consciousness, futures, Gebser, integral theory, language, macrohistory, narrative, participation, planetary, postformal, Steiner, Wilber, space, time, writing.

Preface

Before introducing my research, I wish to provide a brief context regarding myself, my interests, and my passion for this research. Although I have been a lifelong, activist-optimist at heart, I am stirred by the urgency of our times and the challenges we currently face as a species. We live in critical times—times of apparently human-created complexities, challenges and unprecedented change. In all the major domains of our lives the seams are beginning to fray.

Environmentally: *We have altered the biosphere to the extent that our planetary homeland*[1] *may in the foreseeable future become increasingly inhospitable for human habitation. The Fourth Intergovernmental Panel on Climate Change has this to say in its November 2007 Report, just released in Valencia, Spain.*

> Warming of the climate system is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level. (Intergovernmental Panel on Climate Change, 2007, p. 1)

Economically: *We have a growing inequity of wealth distribution both between and within nations. Ervin László (2006) refers to the unsustainability of affluent consumption and the unsustainability of wealth distribution. Referring to relevant global statistics, he summarizes the interrelationships.*

> The richest 20 per cent earn 90 times the income of the poorest 20 per cent, consume 11 times as much energy, eat 11 times as much meat, have 49 times the number of telephones, and own 145 times the number of cars. The net worth of 500 billionaires equals the net worth of half the world population. (p. 16)

Psycho-socially: *With regard to the psycho-social climate, my own research (Gidley, 2005a) in the area of youth futures has uncovered disturbing trends in the mental health and well-being of young people. I ask myself: What is the value of a society if it is making its children and young people sick?*

> Comparative studies (OECD [Organization for Economic Co-operation and Development] countries) indicate that when the figures for all mental health disorders are combined (including ADHD, [Attention Deficit Hyperactivity Disorder], Conduct Disorder, Depression, Anxiety, etc), as many as 18-22% of children and adolescents suffer from one or more of these disorders. (p. 19)

Several contemporary ecologists, educators, philosophers and scientists point to an epistemological crisis—or crisis of consciousness—at the heart of our planetary dilemma (Earley, 1997; Gangadean, 2006a; László, 2006; Miller, 1993; Montuori, 1999; Morin, 2001a; Morin & Kern, 1999; Slaughter & Inayatullah, 2000; Swimme & Tucker, 2006; Wilber, 2001a). Many researchers from a range of interests—such as macrohistory, philosophy, physics and developmental psychology—call on the notion of the evolution of consciousness as a concept

---

[1] See Edgar Morin's planetary manifesto *Homeland Earth* (Morin & Kern, 1999).

from which to explore possible ways through our epistemological crisis. At the outset, I wish to situate myself as researcher[2] *within this global systemic shift*[3] *and to dedicate my research to the planetary effort currently underway among critical-scholar-activists—or transformative intellectuals*[4]*—to consciously shift the global epistemic paradigm from one of fear and fragmentation to one of hope and integration. This paper comprises the central analysis section of a larger research project. The larger project begins with the youth problematique—the voices of youth who sense a spiritual vacuum in our society—and the inadequacy of the modernist model of formal education to address our planetary crisis. My research journey then takes me to other, more idealistic, more integral philosophical worlds where I dive into the origins of our human story. It is here that I ask the Foucaultian question.*[5] *Why did Western thought, science and philosophy separate the idea of spirit from humanity in its reconstruction of its own history? This central question inspires and drives my research as presented in this paper. The final part of my larger project returns to my pragmatic ground of action—educational transformation—the educational imperative of postformal-integral-planetary consciousness (Gidley, 2007a).*

1. Introduction

> There are periods in human and cultural evolution when humanity passes through such fundamental transformations that our reality shifts and new patterns of thought are required to make sense of the unfolding human drama . . . The profound transformation we are now witnessing has been emerging on a global scale over millennia and has matured to a tipping point and rate of acceleration that has radically altered and will continue to alter our human condition in every aspect. We must therefore expand our perspective and call forth unprecedented narrative powers to name, diagnose, and articulate this shift. (Gangadean, 2006b, p. 382)

This paper foregrounds the *evolution of consciousness* as a planetary imperative if we are to survive and thrive as a species on our earthly home. The notion that human consciousness *has* evolved is a largely undisputed claim.[6] However, the notion that human consciousness *is currently evolving,* in such a way that we can *consciously participate* in this process, is an emergent theme in academic research. Integral philosopher Ashok Gangadean in the opening quotation encapsulates what many integral theorists have been voicing over the past decade. It is this integral research on emergent movement(s)[7] of consciousness that I am referring to as the

---

[2] My complex interests in this research arise from my various roles and experience as a psychologist, educator at both school and university levels, futures researcher and mother.

[3] Philosopher Roland Benedikter uses the term *Global Systemic Shift* to cohere the complex interplay between the different—but coalescing—roots and streams of change reflected in the current political, cultural, religious and economic symptoms (Benedikter, 2007).

[4] See Giroux's critical pedagogical approach: teacher as transformative intellectual (Giroux, 1992).

[5] Based on Foucault's question asked in relation to the Greek, *Gnothi Seauton,* discussed below.

[6] Notwithstanding the evolution vs. creationism debate, still ongoing in education in the USA.

[7] Gebser uses the term *structure* to clearly distinguish from the controversial use in his times of terms such as *stage* or *level*. Wilber, also drawing on the adult developmental psychology research, uses the terms *stage* and *level* to stress the developmental nature of consciousness. Steiner uses similar terms to Wilber. Given the contemporary discussion within integral and transpersonal theory surrounding structuralism and post-structuralism (Ferrer, 2002; Wilber, 2005a)—which space does not allow me to

evolution of consciousness discourse. [8] This research points to the emergence of a new structure, stage(s)[9] or movement of consciousness that has been referred to by various terms, most notably, *postformal*, *integral* and *planetary*.[10]

The major focus of the research reported here is to facilitate a broadening and deepening of the evolution of consciousness discourse, particularly within integral theory. My aim is to contribute to the development and enactment of integral theory, by emphasizing the integration of the whole person through identifying the significance of *participatory* and *aesthetic*—in addition to *conceptual*—theoretic components. This is approached by an interpretive analysis and integration of three significant integral theorists, Rudolf Steiner, Jean Gebser and Ken Wilber.

The research reported here is part of a larger research project,[11] which in itself is part of my broader life-work-passion[12]—within which I have identified a number of complex theoretical and methodological issues and challenges in comprehensively researching the evolution of consciousness. These issues and challenges will be summarized later in this introduction. Briefly, this research began with a broad scan of the evolution of consciousness literature to contextualize it within the broader evolution discourse. This preliminary review exposed several gaps and biases in the discourse to date—as will be discussed further below. This paper seeks to expose some of these gaps and to open new questions in relation to how they might be addressed. Rather

---

enter into—I have chosen to use the term *movement(s) of consciousness* as a contribution to this terminological dilemma, when I am not referring directly to the terms of the others. *Movement of consciousness* is a poetic-conceptual phrase that was used by Hegel, Goethe and Sri Aurobindo, to express something of the complexity I am trying to elucidate in *my* contribution to evolution-of-consciousness theory.

[8] By the term *evolution of consciousness discourse*, I am primarily referring to the growing literature from various domains that posit a movement—or movements—or consciousness. A distinction can be made between literature that discuss the evolution of consciousness *per se* and literature that enacts a new type of consciousness without conceptualizing it as such (Gidley, 2007a). This distinction is discussed more fully towards the end of this paper.

[9] Issues surrounding the debate over whether there is one—or several—stage(s) beyond Piaget's formal operations, will be addressed to some degree later in this paper. This is a matter primarily concerning individual psychological development and although there are parallels with cultural evolution, it is also important not to conflate the two domains.

[10] These terms and others will be discussed in due course.

[11] Although the research presented in this paper has been initially undertaken as part of Doctoral research, it became evident that its potential scope will extend far beyond this and several additional post-doctoral papers are already in preparation. (See also Preface).

[12] After two decades of academic and professional experience in psychology and education, I began to engage over the last decade, in futures research in education—mainstream, Steiner and integral (Gidley, 1998b, 1998c, 2002b, 2004a; Gidley & Hampson, 2005, In Press); evolution of consciousness (Gidley, 2002c, 2005b, 2006, 2007b); and the planet-wide impact on young people of globalization (Gidley, 2000a, 2001c, 2001d, 2002a, 2004c). My research uncovered both a *youth problematique*—linked to fragmented and limited worldviews underpinning modernist education models, and the dominant media culture of fear and negative future scenarios—and also ways forward towards futures of active hope and reintegration (Gidley, 1998a, 2000a, 2000b, 2000c, 2001a, 2001e, 2003, 2004b, 2005a, In Press; Gidley & Hampson, In Press).

than attempting an expanded overview of the entire evolution of consciousness discourse, my research engages in an in-depth focus on Steiner,[13] Gebser and Wilber. Based on the theoretic narratives of these three, and much of the evolution of consciousness discourse that will be discussed more fully later, my research takes as its provisional starting point the notion that a new movement of consciousness *is* emerging at the species level, and that it is a planetary phenomenon. However, my research also seeks to broaden the general evolutionary narrative surrounding our human journey, through introducing and integrating the integral theoretic narratives of Steiner, Wilber and Gebser. This reflects a circularity of methodology—referred to as a hermeneutic circle—which does not set out to empirically prove a point, but to deepen understanding. This requires the reader to hold certain questions in mind until the completion of the paper when a deeper understanding is expected to arise. In the penultimate section of the paper, which deals more concretely with the evidence for the emergence of a new movement of consciousness, a more in-depth study of the relevant literature is undertaken.

The paper takes the form of a narrative that I, the researcher, weave from the theoretic narratives of the three authors. The narrative style I am using could be described in a similar way to Foucault's genealogy "as a unique and hybrid blend . . . incorporating accounts based on verifiable "facts" and documents as well as rhetorically-laden arrangement of this material" (Biebricher, 2005, p. 12). The increasing use of narrative in both qualitative research and also the sciences is a postmodern phenomenon, arising from the recognition of the contingent, contextual nature of all "truth claims" (Biebricher, 2005; Bocchi & Ceruti, 2002; Chase, 2005; de Beer, 2003; Denzin & Lincoln, 2005; Heikkinen, Huttunen, & Kakkori, 2000; Poletti, 2003).[14]

In brief, the topic needs to be approached in a transdisciplinary[15] manner, informed by a multitude of theoretical perspectives, yet this often does not occur. My theoretical approach is transdisciplinary, strongly informed by integral theory, futures studies and feminist perspectives. My methodological approach is informed by postformal *bricolage*,[16] a complex, multi-method approach which allows for the organic incorporation of a range of methods and analysis tools at different stages of a research project (Kincheloe, 2001, 2005; Kincheloe & Berry, 2004; Kincheloe, Steinberg, & Hinchey, 1999). Within this, my primary analysis method in this paper is hermeneutics—an interpretive, qualitative research method, which originally developed out of interpretation of Biblical texts. Hermeneutics has been gradually refined during the last two hundred years to become a significant research method for the social sciences, as an alternative to empirical research, which in many cases—such as for this research—is inapplicable. A major feature of hermeneutics is that it involves a circling of understanding between the whole and the parts—and thus in my view is ideally suited to this research, honoring its holonic nature. The hermeneutic circle, also referred to by hermeneutic philosopher Richard Palmer (1969) as a "circle of contextual meaning," (p. 17) is built up in the process of reading the work. As Palmer explains, "somehow, by a dialectical[17] process, a partial understanding is used to understand still further, like using pieces of a puzzle to figure out what is missing" (p. 25). In complex work of this nature, a second reading is always helpful in building the circle of contextual meaning. This material will be further discussed below under theoretical and methodological issues.

---

[13] Steiner's work has been particularly undervalued in the integral academic community, perhaps partially related to Wilber's substantial non-inclusion of his work. This is a significant omission given that my research suggests that Steiner was the first researcher to begin writing, early in the 20th century, about the emergence of a new movement of consciousness. This finding is further discussed later in the paper.

[14] As the writings of many postmodern philosophers have demonstrated, many of the claims that have been taken as *facts* in science are informed by multiple contextual factors (such as historicity, culture, gender, epistemological stance, etc) (Benedikter, 2005; Derrida, 1998; Foucault, 2005; Hampson, 2007; Lyotard, 2004). A postmodern search for truth—if there is such a thing—requires a continual hermeneutic dialogue between *truth claims* and contextual variables. My hermeneutic analysis endeavors to discern between *truth claims* and *contextual biases*—particularly where the narratives disagree with commonly-held, scientific *facts*. Potential contextual biases of the three authors and myself are discussed below.

[15] "As the prefix "trans" indicates, *transdisciplinarity* concerns that which *is* at once *between* the disciplines, *across* the different disciplines, and *beyond* all discipline. Its goal is *the understanding of the present world*, of which one of the imperatives is the unity of knowledge" (Nicolescu, 2002, p. 44). Leading researcher in transdisciplinarity, Basarab Nicolescu, posits three axioms of transdisciplinarity: "The existence of levels of reality; the logic of the included middle; the axiom of complexity" (as cited in Volckmann, 2007, p. 82).

[16] The term *bricolage*, is attributed to anthropologist, Claude Levi- Strauss by educational researchers seeking a postformal methodology to account for such factors as complexity, creativity, and multidimensionality (Denzin & Lincoln, 2005; Kincheloe & Berry, 2004). More recently, evolutionary

Because of the potential vastness of this research territory, it has been necessary to limit the focus in a number of ways. In brief, the meta-process of the first stage of the research—which in itself has involved some hermeneutic circling in my own interpretation and understanding—has involved an expansion and contraction through three major steps:

- An exploratory scan of the entire research territory that informs the evolution of consciousness to discern its overall theoretic shape;
- A preliminary evaluation of its scope and comprehensiveness, aimed at discerning gaps and biases;
- A focusing of attention on the gaps and biases that I discerned.

This paper is concerned primarily with the third point. The criteria I have used for exclusion and inclusion of other research are discussed below under methodological issues. As a result of this process, I have chosen to focus primarily on the theoretic narratives contributed to the evolution of consciousness discourse by Steiner, Gebser and Wilber.[18] In this way, I am enacting

---

theorists have used *bricolage* as a metaphor for representing evolutionary processes that are beyond reductionism, and accident. The tinkering involved in evolutionary bricolage embraces biological principles of self-organization, emergence and creativity (Montuori, Combs, & Richards, 2004; Varela, Thompson, & Rosch, 1993). Interestingly, from a post-structuralist perspective, Derrida also discusses the value of Levi-Strauss's use of bricolage in critical analysis of all discourse (Derrida, 2001).

[17] The methodology of hermeneutics is of potential value to integral and postformal researchers in that it incorporates several features of postformal thinking—such as complexity, reflectivity, holon theory and dialectics.

[18] I wish to note here that my narrative is infused implicitly with the spirit of Sri Aurobindo's integral project. I acknowledge the significant contribution of his philosophical and spiritual writings to my deeper understanding of the issues discussed in this paper. I have not formally included his work as a major thread however as I do not feel my grasp of his vast work is sufficiently advanced to put it into writing as yet. I believe though that there is strong alignment between his work and those of the other major thinkers presented here, particularly in terms of the emergence of a new structure of consciousness and the significance of our times in witnessing and participating in this. I am also inspired and encouraged

a conscious bias, by privileging narratives that have formerly been marginalized in the evolution discourse.

In brief, my decision to focus primarily on these three researchers resulted from the following considerations:

- All three have made major contributions to conceptualizations of the evolution of consciousness yet have been marginalized in the dominant—predominantly biology-based—discourse on evolution.
- As significant contributors to the integral theory[19] knowledge-base, both Gebser and Wilber are also well recognized in terms of their contributions to the evolution of consciousness, yet Gebser is often better "known" for what Wilber has said about him than in his own right.[20] My own study of Gebser has led to the perception that this is insufficient and that Gebser's original writings have far more to contribute to the discourse than is generally acknowledged.
- Steiner's substantial contribution to the conceptualization of the evolution of consciousness is an unfortunate omission in Wilber's otherwise comprehensive work.[21] Notably, Gebser also overlooked Steiner's work even though there are major convergences between them, as this research shows. Steiner's work has also been

---

by the diversity of other pioneering contributors, such as, Pierre Teilhard de Chardin, Henri Bergson and Erich Neumann, as well as contemporaries such as Ervin László, Edgar Morin, Ashok Gangadean, Robert MacDermott, Richard Tarnas, Basarab Nicolescu, Alfonso Montuori, Peter Russell, Brian Swimme and many others who will be included where relevant.

[19] After Hampson (2007), I am using the term *theory* broadly, to connote *theoretic narrative*. The emergent role of narrative as a qualitative methodology will be discussed below.

[20] A further difficulty with Wilber's interpretation of Gebser is that most of his sourcing of Gebser has come from one minor article (Gebser, 1972), or from a secondary source, Feuerstein (1987). Wilber is quite open about this situation, however it does raise the issue of how thoroughly Gebser's original work has been covered (Wilber, 1996a, p. viii; 2000a, p.606, notes 36,37).

[21] Apart from an occasional mention within a list of other people, the main two references to Steiner that I have been able to locate in Wilber's writings include the following, both from *Integral Psychology* (Wilber, 2000b):

> Steiner (1861-1925) was an extraordinary pioneer (during that 'genesis period' of Fechner, Jung, James, etc) and one of the most comprehensive psychological and philosophical visionaries of his time. The founder of anthroposophy, he authored over two hundred books on virtually every conceivable subject. (p. 43)
>
> I am often asked what I think of Steiner's writings. Although I have a great deal of respect for his pioneering contributions, I have not found the details of his presentations to be that useful. I believe recent orthodox research has offered better and more accurate maps of pre-personal to personal development, and I believe the meditative traditions offer more sophisticated maps of transpersonal development. Still, one can only marvel at the amount of visionary material he produced, and his overall vision is as moving as one could imagine. (Note 11, p. 228)

So, although Wilber appears to take a positive view of Steiner's work, he has not embraced it in detail, which unfortunately adds to the marginalization of Steiner's work in integral theory. I must also note that it is not easy to get a meaningful grasp of Steiner's corpus without a great deal of immersion in large volumes of work. This is one of the dilemmas this research hopes to counter-balance.

overlooked by many contemporary integral theorists[22] and in my view deserves more consideration.

- No other substantial academic research has been undertaken that explores the relationships among the works of Steiner, Gebser and Wilber.[23] Although this may not in itself be significant, the richness and depth that is brought to the discourse by an in-depth inclusion of Steiner's and Gebser's original research, alongside Wilber's is highly significant, as demonstrated in this paper.[24] Through my hermeneutic translation efforts, my research creates conceptual *lines of flight*[25] between the three narratives.
- The major thrust of Wilber's writing is cognitive/conceptual.[26] By contrast, the narratives of Steiner and Gebser add important other dimensions to the enrichment of integral theory. Both Gebser and Steiner highlight the importance of participatory[27] enactment of integrality and of the artistic/aesthetic[28] domain in the development of new movements of consciousness. Gebser's approach is also self-reflectively participatory in that he enacts integrality in his very writing.
- My integrative intent is also to offer interlinking counterweights to the main critiques that have been offered to each. Critiques of both Steiner's and Gebser's work are that it is too dense and difficult to read, whereas Wilber's work is easily accessible to contemporary readers. By contrast the critique of cognicentrism in Wilber's work could be complemented by the participatory and aesthetic features of Steiner's and Gebser's narratives.
- From a critical-feminist-*relational*-perspective, I also note that many members of the interpretive communities[29] that are inspired by the works of Steiner, Gebser and Wilber have a tendency toward isolationism with an uncritical focus on what may be *superior* about one theory or another. My interest in this regard is to assist in the building of conceptual bridges between their approaches.

---

[22] Several integral philosophers/theorists have indicated the potential value of Steiner's writings to integral theory, including Benedikter, Gangadean, Lachman, McDermott, Ron Miller, Tarnas, and Thompson to name a few.

[23] Comprehensive philosophical research has been undertaken on Steiner and Wilber by Benedikter but this is not yet available in English.

[24] This is part of my broad research interest in *integrating the integrals*.

[25] *Lines of flight* is a poetic Deleuzian term I am favoring, in preference to the more mechanistic notion of conceptual *bridges* (St. Pierre, 2004).

[26] Wilber's work has been critiqued as too cognicentric.

[27] This would extend recent work on the importance of participatory notions in integral theory (Ferrer, 2002; Ferrer, Romero, & Albareda, 2005; Hampson, 2007).

[28] This would also extend recent research on the significance of creative/artistic/aesthetic expression in integral theory (Goerner, 2004; Montuori, Combs, & Richards, 2004; Roy, 2006b).

[29] All three of these authors have large global communities who draw on their work with apparently little conversation between them, either academically or professionally. I do not believe that isolationist approaches any longer serve the planetary community, given that all these approaches have much to contribute to the challenges our planetary community faces.

- Finally, I am interested in introducing to a wider research community my tentative exploration of the relationship between Steiner's heterodox, spiritual-scientific research methods and László's *Akashic*, or *in*-formation, field.[30]

I wish to also make explicit my awareness that some of the heterodox methods and unorthodox findings of Steiner, Gebser and Wilber—from the perspective of a worldview of scientific materialism—may be quite challenging to some formal academic readers. However, my belief in the significance of my research, the support I have found in associated literature and the urgency I feel in relation to our times, leads me to pursue this project of privileging the marginal—regardless. Furthermore, I am confident that my methodology, particularly the hermeneutic contextualization, provides a means of buffering the bias I am deliberately enacting, by making it explicit.

The organization of this paper is structured such that it is a reflection of the theme that it addresses. It is organized with regard to Gebser's five structures of consciousness—archaic, magic, mythical, mental and integral—through which he characterized and enacted integral-aperspectival consciousness explicitly and artistically. My intention is to model Gebser's enactment of integral-aperspectival by using four dimensions of primary content—presented, for academic convenience, as the major narrative followed by three appendixes.[31] While the four dimensions of my article will each foreground one of Gebser's structures—excluding archaic[32]—all five structures will be explored hermeneutically and gradually elucidated throughout all aspects of this four-part article. Within the main paper, which takes the form of a narrative, there are several sections, one[33] for each structure of consciousness. Each of these major sections include the following sub-sections:

- An academic context,
- A discussion of terminology issues,
- A list of key features, some of which are discussed in detail, including some deficient[34] features,
- A summary of contemporary relevance, and
- A section on the transition to the next structure.

---

[30] The fact that Laszslo's Akashic Field theory underpins his entire *integral theory of everything* makes this component of my research even more significant (László, 2007).

[31] These four interwoven pieces may, however, be read in the order of preference of the reader, as neither the content nor the style presupposes a linear sequence but rather a spherical counter-illumination.

[32] As will be demonstrated, what is referred to as archaic consciousness is pre-conscious and thus cannot be enacted in an academic paper at least in terms of content demarcation.

[33] In addition, there will be one additional section between the magic and mythical sections, because there are some complex differences between the three narratives in relation to the timing of this transition. Finally, there is a concluding section that evaluates the narratives and draws all the threads together.

[34] Gebser uses the terms *efficient* and *deficient* when discussing the structures of consciousness—beginning with the magic structure. I will discuss the issues surrounding these concepts at that point.

This systematic arrangement of the material reflects a postmodern presentation form creating a rhythmical pattern of repetition and difference (Deleuze, 1994). My writing is also multi-layered and can be read at a number of different levels of engagement.

Authentic integration requires a depth of understanding. This is unlikely to occur without a depth of engagement with the material. Because my aim is not a superficial syncretism but rather an authentic integration, I have included a substantial number of textual extracts from all three authors. Hence the paper is very lengthy. However, the concentration on textual analysis is also a fundamental aspect of the type of hermeneutic methodology that I am employing.

I am aware that this paper demands a great deal of the readers, because of its length, its complexity and the hermeneutic requirement that the reader hold a lot of information in mind before a resolution of understanding arises. However, the notion of evolution of consciousness is beginning to matter to many people as their self-reflective, criticality awakens. Surely it will also matter that we give to the discourse the broadest and deepest possible attention. As a woman, mother, psychologist, educator and futures researcher, I know there are very important threads in these marginalized theoretic narratives that the world as it stands would benefit from. My research passion is to find ways to bring to the attention of those who hold the power in the evolution of consciousness discourse the treasures hiding in this overlooked knowledge. Of course, the works I am drawing from—particularly the vast *opera*[35] of Steiner and Wilber—can be read from many perspectives and mine could be opposed or critiqued from any number of these. As a point of self-reflection, however, at the end of the day, this is *my* narrative; *my* hermeneutic interpretation; *my* tapestry—with all its beauty and its flaws; all its strengths and weaknesses.

In summary, this paper provides an in-depth hermeneutic analysis of the writings of Steiner, Gebser and Wilber. My intention is to broaden and deepen the scope of the evolution of consciousness discourse, particularly its development within integral theory. In addition to the conceptual breadth of Wilber's theories, the major dimensions of participation/enactment and aesthetics/artistry can be more fully included via the narratives of Steiner and Gebser. My intention is to contribute to the development of integral theory, by emphasizing the integration of the whole person through highlighting—in addition to integral *conceptualization*—the *participatory* and *aesthetic* features as significant integral theoretic components.

A Brief Background to the Evolution of Consciousness Discourse

> *The significant problems we have cannot be solved at the same level of thinking with which we created them.* (Einstein)

Before proceeding, I will briefly characterize my usage of the key terms *consciousness* and *evolution*. However, a deeper sense of the meaning of the terms will only become clear as the paper unfolds. Additional key terms will be discussed in the next major section of this paper, *A*

---

[35] Each of Steiner and Wilber has produced a vast *opus* of work. The plural of opus is *opera*. I rather like the semiotic hint in this term.

Macrohistorical Planetary Tapestry: The Fascinating Integral Narratives of Steiner, Gebser and Wilber.

By *consciousness*, I am referring to the type of complex consciousness that is expressed by human thinking as it develops through various expressions over time, both historico-culturally (phylogenesis) and within individual psycho-spiritual development (ontogenesis). This is referred to in the consciousness studies literature as *phenomenal consciousness* or *qualia,* which is understandably described by David Chalmers as the *hard problem*, as distinct from simple perceptual consciousness which Chalmers calls the *easy problem*[36] (1995, 1996). It includes, but is not limited to, cognition. My perspective on consciousness, which will be developed throughout this paper in the light of an elucidation of Steiner's, Gebser's and Wilber's views, departs from much of the current, neurobiology-based, consciousness studies literature which claims that consciousness is dependent primarily on the brain for its existence.[37]

My usage of the term *evolution* cannot be *nutshelled* here but will emerge throughout this paper. At the very least my meaning includes biological, socio-cultural and philosophical discourses. The notion of socio-cultural evolution has been contested since the abuses arising from 19th century socio-biological models—such as Social Darwinism—during the 2nd World War. Anthropological critiques include claims that cultural evolution models are ethnocentric, unilineal, too oriented towards technological materialism, privileging progress rather than preservation and speculative rather than evidence based. How this narrative addresses these issues will be discussed under theoretical issues. A range of disciplines and discourses that can inform evolution of consciousness are indicated in Figure 1 below.

The evolution[38] of consciousness discourse has a relatively short history in the academy.[39] The notion was originally seeded by several German Idealists and Romantics towards the end of the 18th century. Almost a century before Charles Darwin published his *Origin of Species* (1859/1998), Johann Gottfried von Herder published *This Too a Philosophy of History for the Formation of Humanity* (1774/2002), setting out the notion that "there exist radical mental differences between historical periods, that people's concepts, beliefs, sensations, etc. differ in important ways from one period to another" (Forster, 2001). Von Herder's seminal ideas on the evolution of consciousness were extended in manifold ways by Johann Wolfgang von Goethe,[40] Georg Wilhelm Friedrich Hegel,[41] and Friedrich Wilhelm Joseph Schelling.[42] These pioneering individuals both conceptualized and enacted an integrative worldview—for example Goethe was an eminent scientist, philosopher and literary pioneer. In particular, Schelling's contribution foreshadowed current notions of *conscious* evolution (Teichmann, 2005). Although inspired by earlier unitive worldviews, these integral philosophers also pointed forward, beyond the limitations of both pre-modern, mythic consciousness and modernist *formal* rationality, foreshadowing a more conscious awakening of a *postformal*, integral consciousness. In the early 20th century these ideas were further developed by several pioneers (Aurobindo, 2000; Bergson, 1911/1944; Gebser, 1970/2005; Lovejoy, 1936; Neumann, 1954/1995; Steiner, 1926/1966b, 1959a; Teilhard de Chardin, 1959/2002, 1959/2004).

---

[36] Chalmers (1996) makes it quite clear that psychological properties like learning and memory, while posing some philosophical issues, are primarily small technical issues that can be addressed through research and are thus an 'easy problem.' In contrast, the 'hard problem' arises because the "impressive progress of the physical and cognitive sciences has not shed significant light on the question of how and why cognitive functioning is accompanied by conscious experience. The progress in understanding the mind has almost entirely centered on the explanation of behavior. This progress leaves the question of conscious experience untouched" (p. 25).

[37] This is referred to in the consciousness science discourse as *epiphenomenalism*. "[This] is the view that mental events are caused by physical events in the brain, but have no effects upon any physical events." http://plato.stanford.edu/entries/epiphenomenalism/

[38] In addition, the meaning of the term *evolution* in this paper should be seen to sublate within itself two other terms that are often seen to be in contradiction to it, these being *emergence* and *involution*. It is beyond the scope of this paper to discuss, however, this is the subject of a further paper (Gidley, 2007c).

[39] There is also a longer and deeper genealogy to this story, told orally among the ancient wisdom traditions (Bamford, 2003; Lachman, 2003; Steiner, 1973b) However, it is beyond the scope of this paper to explore this material in detail.

The general notion of evolution—and thence consciousness evolution—became academically colonized by classical biology as a result of the mid 19th century interpretations of Darwin's work.[43] Clearly, biology as a discipline has been transformed by such 20th century developments as chaos and complexity theories, with classical Darwinism and neo-Darwinism more recently making way for emergence theories (Braxton, 2006; Deacon, 2003; Goodenough & Deacon, 2006; Thompson, 1991). In spite of these developments within biology, science during much of the 20th century was grounded in a materialist worldview. Darwinian evolutionary notions reputedly also influenced other late 19th century socio-cultural theories, such as pioneering sociologist, Auguste Comte's (1855/2003) views on *social progress*, and Herbert Spencer's (1857) *developmental* and *progressive* theories—most notably, Social Darwinism (Barnard & Spencer, 1998). The evolution discourse remained dominated by a physicalist form of biology, such that significant pioneering works on the evolution of consciousness, that were inclusive of spiritual dimensions, were ignored, dismissed or marginalized by the *science of the day* (Aurobindo, 2000; Bergson, 1911/1944; Gebser, 1970/2005; Neumann, 1954/1995; Steiner, 1926/1966b, 1959a; Teilhard de Chardin, 1959/2002, 1959/2004). Although the last few decades have seen a reconsideration of some of these pioneers—particularly as a result of integral approaches to the evolution of consciousness—the new biological sciences still retain a powerful claim on the evolution of consciousness discourse (Loye, 2004). However, the growing awareness of a potential planetary crisis has highlighted the significance of finding new ways of thinking, if humankind is to move through our current complex challenges. This critical imperative appears to be mobilizing researchers from a wide range of disciplines to broaden the notion of evolution of consciousness beyond its biological bounds. Although only a small number of articles are as yet appearing in academic journals, there is evidence of some disciplinary diversity.[44]

---

[40] Goethe, through his integration of science and literature, drew on his extensive biological studies in morphology—a term he coined—to ground the concept of evolution of consciousness which he introduced in his novel *Wilhelm Meister's Apprenticeship*, which he published in 1796.

[41] Hegel's focus in the evolution of consciousness domain was particularly concerned with the evolution of ideas and concepts and introduced in his lectures on the History of Philosophy.

[42] Schelling's seminal integrative philosophy provides the genealogical trace for two of the currently divergent streams of postmodernism—deconstructive and reconstructive, as outlined by Arran Gare's philosophical research (Gare, 2002), recently also summarized by Hampson (2007) in this journal.

[43] Several more recent interpretations point to a much fuller breadth in Darwin's original writings (Conway Morris, 2007; Loye, 1998; Richards, 1992, 2002).

László (2006) aptly sums up this critical imperative in the following rallying call:

> Einstein was right: the problems created by the prevalent way of thinking cannot be solved by the same way of thinking. This is a crucial insight. Without renewing our culture and consciousness we will be unable to transform today's dominant civilization and overcome the problems generated by its shortsighted mechanistic and manipulative thinking.
> . . . The conscious orientation of the next cultural mutation—the shift to a new civilization—depends on the evolution of our consciousness. This evolution has become a precondition of our collective survival. (pp. 39, 77)

The *evolution of consciousness* has become a central theme in much of integral theory. In its many forms[45] integral theory is making a significant contribution to the discourse. Yet leading integral theorists, such as Wilber and László, appear not to see eye to eye in their somewhat rivalrous endeavors to each create an *Integral Theory of Everything* (TOE)*,* within which their writings on the evolution of consciousness could be theoretically situated (László, 2007; Wilber, 2000a). A major distinction appears to be that László (2007) builds his *general evolution theory* in a more formal, systematic manner. He claims that he built significantly on the theoretical traditions of Whitehead's *process* theory, Bertalanffy's *general system* theory and Prigogine's *non-linearly bifurcating dissipative structures* (p. 164). Wilber's process appears to have been much broader and more diverse—but perhaps less systematic—gathering together as many theorists in as many fields of knowledge as he could imagine, then arranging them according to the system that he developed—which he calls an *integral operating system* (Wilber, 2004). Another difference is that although they both appear to use *imagination* and *intuition* in the construction of their theoretical approaches, Wilber does not make this explicit whereas László (2007, p. 162) does. Numerous other researchers, particularly over the last decade, have also contributed to the evolution of consciousness discourse, but the various theoretical strands still stand in relative isolation from each other. These issues will be discussed below.

It is my view that no single discipline or field can colonize the evolution of consciousness discourse—not even science. Because of its complexity the topic can only adequately be approached in a transdisciplinary manner. Nor can it be colonized by a particular theoretical approach, no matter how apparently integral that approach claims to be. Such disciplinary and theoretical constraints would only serve to limit our potential understanding.

---

[44] In a recent title search of four academic databases using the words "evolution" and "consciousness" sixteen articles were retrieved with seven of them from a biological/science perspective, the remainder were from the perspectives of psychology (two), philosophy (two), theology (two), the arts (two) and language (one).

[45] Hampson (2007) has put forward an ecology of integrals that includes six intertwined genealogical branches: those aligned with Sri Aurobindo, Gebser, Wilber, Gangadean, László and Steiner (noting that the Steiner branch is via the conduit of my research on Steiner, Gebser and Wilber) (p. 121). I am in agreement with this ecology, which to a large extent co-arose from our dialogues.

Theoretical Issues Surrounding Evolution of Consciousness Research

> Ultimate truth, if there be such a thing, demands the concert of many voices. *Carl Jung*. (cited in Neumann, 1954/1995, p. xiv)

There are several complex theoretical issues in evolution of consciousness research.

A. Direct and Indirect Evidence for Evolution of Consciousness

The discourse may be informed from two broad directions. The first is the research that directly identifies new stage/s or emergence of consciousness. The second is research that apparently enacts emergent postformal, integral, and/or planetary consciousness without identifying it as such. This is further discussed in Part 8 of this paper and published elsewhere (Gidley, 2007a).

B. *Short-* and *Long-range* Theories of the Origins of Culture and Consciousness

In regard to the research on human origins there are two major schools of thought. The *short-range theories* which propose that there was a sudden cultural explosion around 30-40,000 years ago in Western Europe associated with the migration of anatomically modern humans and the subsequent replacement of the extant Neanderthals, driving them to extinction. The *long-range theories* propose a much more gradual and also more polycentric process of evolution of culture and consciousness. These theories are discussed at some length in Appendix C.

C. The Postmodern Deconstruction of *Progress, Growth* and *Development*

A major theoretical issue in researching the evolution of consciousness is that it is intimately linked with socio-cultural evolution and the contentious 19th century models of social progress and development of Auguste Comte (1855/2003) and Herbert Spencer (1857). Such theoretical models were used to rationalize many racist and ethnocentric social abuses—including slavery, colonialism and ethnocide. Cultural anthropologists developed powerful critiques of these models, particularly following on from the early 20th century shift to ethnographic field research. For a few decades the notion of evolution itself came under critique from anthropologists and critical social scientists. However, there has been a revival of interest as new, more integrative anthropological theories began to emerge, such as Marshall Sahlins' theory that there is both evolution of human culture in general—characterized by "growing complexity and unilinearity, with culture apparently leaping from one societal form to another," and specific evolution, "to account for the great variety in historical developments" of particular societies (Barnard & Spencer, 1998, p. 214). In addition to the contributions of integral theory which are my focus, developments in world systems analysis, systems philosophy and macrohistory have also contributed to a broadening and integrating of theoretical perspectives (Galtung & Inayatullah, 1998; László, 2004/2007). It is beyond the scope of this paper to discuss these developments in detail. A superficial glance at the narratives of Steiner, Gebser and Wilber may give an impression that they are simply modernist, unilinear, socio-evolution models packaged as something more. How they each deal with these issues will be addressed under the methodological issues section below.

D. Paradoxical Thinking Within the Discourse

There is a paradox[46] surrounding this research in that an emerging postformal, integral movement of consciousness can best be understood from the types of thinking that actually reflect postformal, integral consciousness. Not surprisingly, one of the characteristics of postformal thinking identified in adult developmental psychology is paradoxical thinking— "the capacity to see and accept paradox and tolerate ambiguity" (Cook-Greuter, 2002, p. 24).[47] This research does not claim to resolve such a paradox, but rather to point to its existence.

E. The *Evolution* of Evolution Theory

In regard to the *evolution* of evolution theory, the present research does not succumb to the *evolution-terminus fallacy*[48]—where modern humans have reached their ultimate stage. Rather it adopts a developmental and futures approach to the evolution of consciousness—in particular pointing to the current emergence of a new movement of consciousness. This calls for an evolution of the discourse itself. It is beyond the scope of this paper to discuss this but it will be elucidated as part of the larger project (Gidley, 2007b).

F. Territorial Issues in the Discourse

There are several territorial issues including at least; socio-cultural and geo-political territorialism around earliest artifacts; epistemological issues surrounding disciplinary territorialism; and philosophical issues related to the contestation between the dominant discourse based on a metaphysics of physicalism and the alternative discourse based on a metaphysics of integration of spirit and matter. It is beyond the scope of this paper to discuss this but it will be elucidated as part of the larger project (Gidley, 2007b).

G. The Notion of *Adequatio*

Neo-Platonist, Plotinus (205-270 CE) developed the notion of *Adequatio*—most likely informed by Aristotelian concepts. *Adequatio* means "the understanding of the knower must be adequate to the thing to be known" (Schumacher, 1977, p. 39). In regard to the *adequate coherence* between the object of knowledge in this research—the evolution of consciousness—and the epistemology that is researching it, the present research is framed within a postformal, integral, layered epistemology that foregrounds the *noosphere* and its role in conscious evolution. I also include spirituality in contrast to the dominant physicalist discourse. It is beyond the scope of this paper to discuss this but it will be elucidated as part of the larger project (Gidley, 2007b).

---

[46] A similar paradox can be expressed in relation to creative thinking: "in order for creative thinking to be understood and articulated, it requires the very kind of creative thinking that it seeks to understand" (Montuori, Combs, & Richards, 2004, p. 226).

[47] This is one of the characteristics of Cook-Greuter's *autonomous* stage.

[48] This is a phrase I have coined to refer to the evolution of the discourse itself in relation to evolution (Gidley, 2007b).

H. Postformal Enactment of Language and Construct Awareness

A further—and perhaps the most complex—theoretical issue is that, in addition to the claims of all three authors I focus on in this paper that consciousness is evolving, it is implicit in all of their work that they see themselves as operating from a consciousness that is beyond the modernist/formal thinking of their day.[49] While it is beyond the scope of this paper to actually establish the veracity of this proposition, it is clearly a theoretical challenge of this work as it implies a superior truth claim. In the final section of this paper I will return to this issue with some further reflections, particularly in regard to examples from their language styles.

I. Epistemological Pluralism of Minor Threads in the Discourse

Current theories concerning the evolution of consciousness arise from a number of schools of thought. These can be categorized in many different ways. It is worth noting that debate surrounding scientific evolution theory and its *pros and cons* is still alive in the USA according to some integral theorists. A recent article in *What is Enlightenment* magazine[50] attempted to contribute to a broadening beyond the Darwinism vs. Creationism poles that are emphasized in the US media. They proposed a twelve-theory spectrum between two extreme epistemological positions—scientific materialism and religious determinism, which they then reduced to *science* and *spirit*. They placed *neo-Darwinists* and *progressive Darwinists* at the science end of the spectrum and *intelligent designers* and *Theistic evolutionists* at the spirit end. In between, they listed a range of other perspectives including *collectivists*, *complexity theorists*, *directionalists* and *transhumanists*, on the science side and *esoteric evolutionists* on the spirit side. At the centre of their spectrum, indicating degrees of integration of science and spirit, they placed *process philosophers*, *conscious evolutionists* and *integralists*—the latter being represented by those theorists whom they appear to favor[51] (WIE, 2007). While this approach may appear at first glance to be a useful and convenient way to categorize as it gives an important overview of some often-neglected approaches, the simple slotting of some theorists into these individual conceptual categories is a gross reduction of their comprehensive epistemologies.[52] Furthermore, it is based on a simple bi-polar dimension between science and spirit, whereas the phenomenology of the evolution discourse is much more complex than that. While I do agree that there is an intimate relationship between the evolution of consciousness discourse and the appropriate development of integral theory, it is vital for the academic credibility of integral theory that this relationship is developed in a scholarly manner. More substantial research on the complexity of these issues is in preparation (Gidley, 2007c).

---

[49] Wilber actually explicitly states that he is writing from a vision-logic standpoint (Wilber, 2000d, pp. 190-191).

[50] WIE is a North American magazine that publishes "reader-friendly" articles on integral theory, including articles by, or about, a range of integral theorists.

[51] Major figures listed as *integralists*: Beck, Combs, Godwin, Goerner, Leonard, Murphy, Thompson and Wilber (WIE, 2007, p. 100). This does not appear to be a comprehensive—or even impartial—list of relevant theorists, according to my research.

[52] A particularly significant misplacement is made of Steiner as an esoteric evolutionist whereas his vast scientific, philosophical and spiritual writings are more substantial than many of those placed as integralists. A similar narrowing has also been made of contemporary philosopher, Tarnas (WIE, 2007, p. 97). Of course it should be acknowledged that this is *not* an academic journal, but rather a populist magazine.

J. The Integrality of Integral *Theories of Everything* Including Evolution

One of my major interests in this paper is to explore this relationship—between evolution of consciousness and integral theory—in some depth and to indicate how different evolutionary perspectives lead to a different kind of integral theory structure, and vice versa. A further point is that it is vital that the discourse is not colonized by a particular version of integral theory. While Wilber and László are arguably the most prolific and significant contemporaries in broadening the evolution of consciousness discourse through their integral theories, my research points to gaps in their theoretic narratives.

Wilber was one of the first contemporary theorists to attempt to draw together, in a transdisciplinary manner, some of the earlier pioneering works on the evolution of consciousness (Wilber,1996a). Because of the popularity of Wilber's work on this topic, and because of the manner in which he has staked his claim on this aspect of integral theory, his theoretic narrative is quite influential. However, there are several taken-for-granted assumptions that have slipped into the integral discourse on the evolution of consciousness, through Wilber's influence, which this paper seeks to uncover. Two assumptions that I wish to challenge in relation to Wilber's self-proclaimed *authority* in this territory are that:

- He has included all the major pioneering theorists of the evolution of consciousness;
- He has accurately represented the research of major theorists, such as Jean Gebser.

László, over the past two decades, has initiated a major research initiative[53] into the serious limitations of the dominant reductionist, scientific discourse on evolution in general. Clearly, this has significant implications for the evolution of consciousness discourse. Considerable research resulting from this initiative has been undertaken by a diversity of scientists—particularly, systems scientists, chaos and complexity theorists and cognitive psychologists (Loye, 2004). Much of their work draws on László's general systems theory (László, 2006, 2007), Riane Eisler's *partnership theory* (Eisler, 1987), and David Loye's emphasis on the notions of love, mind and moral development in Darwin's *The Descent of Man*—which he argues have been completely overlooked in the dominant evolution discourse (Loye, 1998). This research is clearly a major advance on the dominant neo-Darwinist theories.[54] However, it is still limited in that it primarily privileges scientific discourse—albeit the new sciences—without making explicit what discourses are not included, e.g. those from philosophy,[55] theology/spiritual science, mythology,[56] art and oral history, and even developmental psychology. Further, although brief mention is made of Wilber's theories in this research, Gebser's and Steiner's research is overlooked. My research could be seen to build on the work of Laszlo's *General Evolution Research Group* in a number of ways, most obviously through my focus on philosophical, theoretical and methodological approaches that are not limited to scientific epistemologies. In addition, my research directly addresses the following key points in the guidelines to László's and Loye's project for a *fully human theory of evolution*.

---

[53] The General Evolution Research Group (GERG), was founded by László in Budapest, in 1986, during the Cold War. Their stated aim is to create a "full spectrum, action-oriented," or "fully human theory" of evolution. http://www.thedarwinproject.com/gerg/gerg_world_futures.html

[54] It also positions itself within the *credibility* of science, which Wilber does not limit himself to.

[55] Philosopher Arran Gare critiques the lack of philosophical and critical perspective in the research in Loye's book. He points to the apparent lack of awareness of the contribution of idealist philosophers such as Schelling to the notion of "conscious evolution" (Gare, 2007).

- Explore points of evolutionary consensus as well as differences between science and spirituality.
- Work towards consensus on unifying frameworks and imagery . . .
- . . . but explore the ignored, the repressed, and new vision before locking into new paradigms (Loye, 2004, p. 14).

All of these points are being emphasized in my research and in addition, it could contribute significantly to several of their foundational themes—the evolution of love, consciousness, and the drive of creativity in "conscious evolution" (Loye, 2004, p. 13).

While Wilber's and László's *theories of everything* both have enormous merit, they too are partial. In this regard, I discern two major obstacles for integral theorists who seek to introduce more breadth and depth into the evolution of consciousness discourse. The first, the ongoing colonization of the discourse by science narratives, is clearly apparent even within integral theories, such as László's. The second—which is more subtle and tacit—is the potential colonization of the discourse *within* integral theory by particular integral approaches. Clearly, there is some overlap between these two obstacles.

K. Transdisciplinarity Can Include Depth Through Disciplinary Diving

Perhaps I am biased towards Steiner and Gebser—or even Wilber. A critique could certainly be raised about my choice of Steiner and Gebser as major theoretical foci, given that neither of them has been alive to benefit from the incredible advances in knowledge specialization in the last few decades. There is no question that the detailed knowledge acquired by numerous diverse disciplines in their various specialized fields has increased greatly in the last century, since Steiner's and even Gebser's time. However, the question remains: Are we getting close to the kind of integrated understanding of our world that will enable us to address the complexity of current planetary challenges? I suggest that we are not there yet and so does Morin (2001a).

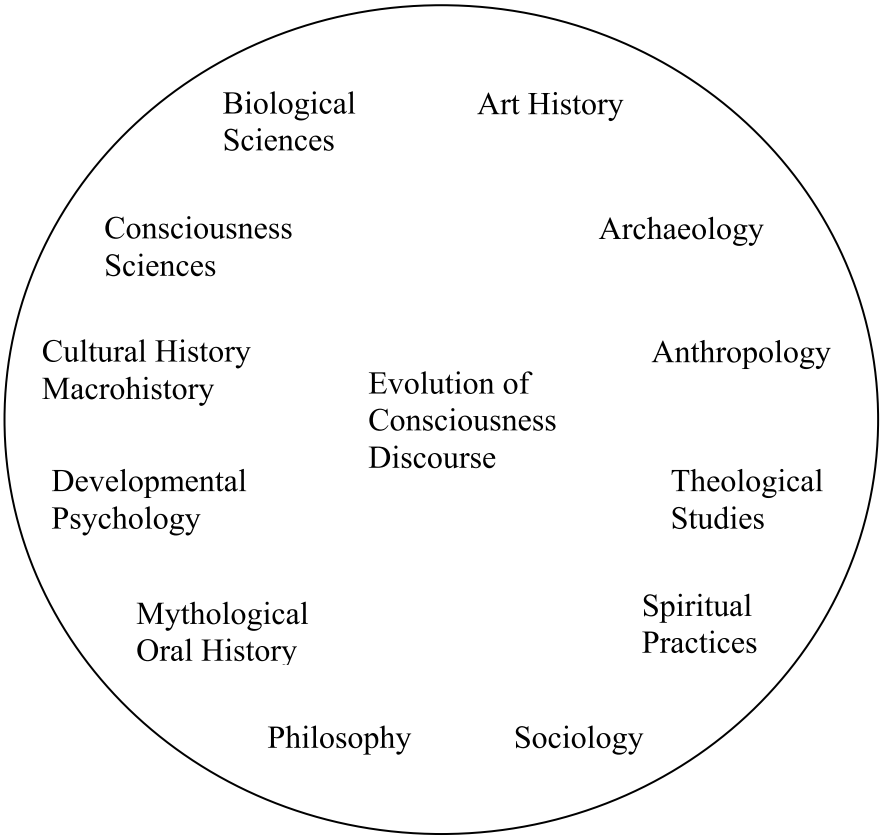
> An influx of knowledge at the end of the 20th century shed new light on the situation of human beings in the universe. Parallel progress in cosmology, earth sciences, ecology, biology and prehistory in the 1960s and 1970s have modified our ideas about the universe, the earth, life and humanity itself. But these contributions remain disjointed. That which is human is cut up into pieces of a puzzle that cannot form an image. This raises an epistemological problem: it is impossible to conceptualize the complex unity of the human

---

[56] Notwithstanding Eisler's substantial contribution to a reconstruction of cultural mythology and history (Eisler, 1987).

> by way of disjunctive thought . . . The new knowledge, for lack of being connected, is neither assimilated nor integrated. There is progress in knowledge of the parts and paradoxical ignorance of the whole. (pp. 39-40)

I propose below a tentative circular model of disciplinary fields that can potentially inform the evolution of consciousness discourse (Figure 1).



Biological Sciences
Art History
Consciousness Sciences
Archaeology
Cultural History Macrohistory
Anthropology
Evolution of Consciousness Discourse
Developmental Psychology
Theological Studies
Mythological Oral History
Spiritual Practices
Philosophy
Sociology

Figure 1: A Circumscription of the Evolution of Consciousness Territory[57]

Although I have undertaken more extensive reviews of the evolution of consciousness literature elsewhere (Gidley, 2007c), the stated purpose of this paper was not to attempt to achieve a broader, more comprehensive review than has already been done. Because the territory is so extensive now, the danger in this approach is to fall into a superficial syncretism. Rather my purpose is to introduce more depth, but in a different way to the kind of depth achieved in disciplinary specialization. The depth I am attempting is to look with a deep gaze at the writings of others who themselves have covered an extensive breadth. I believe that this potentially creates a new kind of scholarly alchemy that has not been frequently attempted to my knowledge. It is referred to as *gap-diving* (Roy, 2006b) and resembles the kind of integration of depth and span that Foucault used in his lectures on the *Hermeneutics of the Subject* (Foucault, 2005).

---

[57] I have deliberately left this diagram conceptually simple, as my purpose is not conceptual mapping—which has already been given much attention by Wilber—but to foreground the importance of participatory and aesthetic dimensions to a fuller conceptualization of the theory.

Before moving on, I particularly wish to honor the significant contributions of several pioneers—other than Steiner and Gebser—to my understanding of the discourse (Aurobindo 2000; Bergson, 1911/1944; Campbell, 1968; Neumann, 1954/1995; Teilhard de Chardin, 1959/2002, 1959/2004). In addition, I find it encouraging that, in addition to Wilber, László and myself, there are a raft of other contemporary theorists from a variety of disciplines who have begun to research the evolution of consciousness from a more integral perspective (Bamford, 2003; Bocchi & Ceruti, 2002; Christiansen & Kirby, 2003; Conway Morris, 2007; Cousins, 1999; Donald, 2001; Earley, 1997; Eisler, 1987; Elgin, 1993, 1997; Eliade, 1954/1989; Firestone, West, & Warwick-Smith, 2006; Gangadean, 2006a; Grof, 1988; Grossinger, 2000; Habermas, 1979; Hart, 2001; Hefner, 1998; Inayatullah, 2004; Jantsch, 1980; Loye, 1998; Montuori, 1999; Morin & Kern, 1999; Nelson, 2005; Neville, 2006; Ornstein & Ehrlich, 1991; Russell, 2000; Subbiondo, 2003; Swimme, 1992; Swimme & Tucker, 2006; Thompson, 1998; Wade, 1996).[58]

My choice of Steiner, Gebser and Wilber was also influenced by the fact that all three of them have in a substantial way included most of these knowledge areas (see Figure 1) in their narratives, whereas many theorists are much more limited in scope. I further propose that although the inclusion of many of these areas is vital to a comprehensive integral evolution of consciousness theory, it is equally vital that such a theory not be merely about content. While Wilber's content is unquestionably comprehensive—and his theory elegant—his areas of weakness are the areas of strength of Steiner and Gebser: participatory engagement and aesthetic sensibility. By contrast, Wilber's embrace of contemporary research and his accessible text complement aspects of Steiner's and Gebser's contribution. Because I have chosen to focus in-depth on three major sources, I acknowledge that my coverage of many significant theorists is of necessity brief. I have also taken into account that Wilber has quoted extensively from many of these sources and I have not in all cases been able to check his interpretation for accuracy as I have done with Gebser.

In my own research I have drawn from all these diverse areas (see Figure 1), although in many cases only to clarify specific details. Because of the somewhat heterodox research methods of Steiner[59]—and to a lesser extent Gebser and Wilber—in regard to palaeo- and pre-history,[60] I have paid particular attention to the academic research that might reflect on these periods. As with the overall stance of my research, it has not been my intention to do a broad scan of the archaeological, paleoanthropological, or art historical research, but rather to dive into specific areas of controversy where there appeared to be a gap or a divergence of consistency. In particular, for the very early pre-historical periods, research from the following—somewhat overlapping—disciplines have been invaluable.

---

[58] Recent educational research by the author (Gidley, 2007a) also draws attention to the growing number of educational researchers who are identifying the need to educate for an evolving consciousness (Goerner, 2000; Hart, 2001; House, 2004; Mazzone, 2004; McDermott, 2005; Miller, 1999; Miller, 2000; Montuori, 1999; Morin, 2001a; Neville, 2006; Sloan, 1992).

[59] Steiner's research methods, along with Gebser's and Wilber's are discussed in the next section.

[60] I am using the problematic term pre-history as it is used according to academic convention—that is prior to literate culture.

- Anthropology (Barnard & Spencer, 1996/1998; Belasco, 1975; Clayton, 2006; Foster, 1996/1999; Gatto, 2004; Headland, Pike, & Harris, 1990; Isenberg & Thursby, 1984-6; Levi-Strauss, 1963; Levinson & Ember, 1996; Lock & Peters, 1999).
- Archaeology (Berg & Woodville, 2004; Domenici & Domenici, 1996; Foucault, 1970/1994; Gatto, 2004; Johnson, 1999; Kühne, 2004; Quilter & Urton, 2002; Seger, 2006; Settegast, 2005; Spears, 1996; Spikins, 1997; Wallis & Spencer, 2003; White, 2006; Zhang, Harbottle, Wang, & Kong, 1999; Zilhão, 2007).
- Art history (Bednarik, 2006a; Berg & Woodville, 2004; Conkey, 1996/1999; Hooker, 1990; Iinitchi, 2002; Quilter & Urton, 2002; White, 2006; Zhang, Harbottle, Wang, & Kong, 1999; Zilhão, 2007).
- Rock art science (Anati, 2004; Bahn, 2005; Bednarik, 1992, 2003b, 2006b, 2006c, 2006d 2007, Brumm & Moore, 2005; Chippindale & Tacon, 1998; Hodgson, 2000; Reddy, 2006).
- Paleo-anthropology and paleo-ontology (Cairns, 2005; Carlson et al., 2007; Colman, 2007; Conard & Bolus, 2003; Conway Morris, 2004, 2007; Gould, 1977; Gutscher, 2005; Key, 2000; Rolston III, 2005; Settegast, 2005; van Huyssteen, 2004; Varadi, Runnegar, & Ghil, 2003; Wood & Collard, 1999).

In addition, considerably more research has also been cited in Appendix C, which deals more extensively with the Palaeo-periods than the main narrative. As my research progressed I became increasingly aware of the Anglophone and Eurocentric bias of the discourse—even within integral theory. I thus endeavored to search beyond the dominant geographical regions to find researchers from diverse cultural backgrounds. Consequently, my list of citations may also be somewhat heterodox. As discussed already, one of my interests is in focusing on research that has been, or is likely to be, marginalized. One could argue for the inclusion of additional fields (such as cosmology and linguistics) and sub-fields (such as transpersonal and depth psychology).

L. *Integration* of Integral Views

Finally, I wish to point to several other contemporary researchers who have attempted an integration of integral evolution-of-consciousness theories. Most include one or two of my key authors, but not all three substantially. Combs (2002) privileges Wilber and Gebser but marginalizes Steiner; Elgin (1993) privileges Gebser and Wilber but does not refer substantially to Steiner; Lachman (2003) privileges Steiner and Gebser but marginalizes Wilber; Thompson (1998) also privileges Steiner and Gebser but marginalizes Wilber. In addition, Benedikter (2005) has researched the philosophical relationships between Wilber and Steiner, with some reference to Gebser, but his work is primarily in German, and as yet most of it has not been translated into English.[61] There are also other macrohistorical/evolutionary narratives which draw primarily on one of my key authors, such as Earley (1997) on Wilber; Feuerstein (1997) on

---

[61] This lack of English translation of Benedikter's work means that it has not entered into the Anglophone integral theory discourse and consequently has been overlooked by many theorists who are limited to the English language.

Gebser; Bamford (2003) on Steiner. Educational theorists Marshak (1997), and Miller (2005), have written substantial educational literature about Steiner, in combination with other educational theorists; and McDermott (1984, 2001) has written substantially—though separately—on Steiner and Sri Aurobindo, and to a lesser extent on Wilber. Finally, the vast majority of contemporary evolutionary narratives make no significant reference to Steiner, Wilber *or* Gebser, drawing principally on *new science* theories (Edelman, 1992; László, 2006; Loye, 2004; Ornstein & Ehrlich, 1991; Russell, 2000; Swimme, 1992); or socio/cultural and/or philosophical theories (Bocchi & Ceruti, 2002; Eisler, 1987; Habermas, 1979; Morin & Kern, 1999). It is to this large-scale omission and/or undervaluing of their significant contributions that this paper pays attention. Given the extensiveness of the territory, I will undoubtedly have omitted some important researchers and/or areas of research. For this I apologize.

Methodological Issues in Postformal Research

> It is perhaps unnecessary to reiterate that we cannot employ the methods derived from and dependent on our present consciousness structure to investigate different structures of consciousness, but will have to adapt our method to the specific structure under investigation . . . contemporary methods employ predominantly dualistic procedures that do not extend beyond simple subject-object relationships; they limit our understanding to what is commensurate with the present Western mentality. (Gebser, 1949/1985, p. 7)

A number of methodological issues need to be explicated in relation to this research. Because of the complexity of the territory, it is imperative that it be approached in a transdisciplinary manner. Secondly, because of the marginal and somewhat heterodox methods of all three authors, it is essential that my methodology in dealing with them be as transparent as possible. Thirdly, the multi-layered nature of this research is a further complication. I have attempted to deal with this by providing a balance of direct textual extracts and interpretation when making a point. Also I begin each section of the narrative with an academic contextualization.

Before introducing the methodologies and validity and truth claims of Steiner, Gebser, Wilber and myself, in the interests of transparency, I will summarize my process in relation to arriving at criteria for exclusion and inclusion of particular research.

Criteria for Exclusion and Inclusion in the Research

The process began with a meta-analysis[62] of the literature related to the evolution of consciousness. It became evident fairly early that this was an overwhelming task and once the literature had been broadly categorized, two exclusion criteria were introduced. The process is summarized below.

At the first level of analysis the evolution of consciousness discourse to date could be categorized into three major subgroups:

---

[62] My research has involved a meta-analysis of the evolution of consciousness literature. Some of this research has been published, as noted and some of it is still in unpublished manuscript form as part of a Doctoral Dissertation and post-doctoral publications.

- Scientifically-based evolution research, particularly from evolutionary biology;
- Additional disciplinary—or sometimes interdisciplinary—research from fields such as evolutionary psychology and anthropology, philosophy, sociology, theology (for more detail on fields that may inform this research see Figure 1 above);
- Transdisciplinary research from integral studies, futures studies, general systems theory.

At the next level of analysis it became apparent that much of this research, is based on the assumption that human consciousness has reached its culmination with rationality, or *formal operations*[63]—to use Piaget's term. The first exclusion category concerned literature that did not honor the notion of further movements of consciousness beyond formal operations in the individual, or beyond mental/rational as a stage of cultural evolution. In relation to the former, there is now a large body of literature, particularly from the adult developmental psychology field, that has established at least one—and up to four—cognitive stages beyond formal operations (Cartwright, 2001; Commons et al., 1990; Cook-Greuter, 2000; Kegan, 1994; Kohlberg, 1990; Kramer, 1983; Labouvie-Vief, 1990, 1992; Riegel, 1973; Sinnott, 1998, 2005). The present paper is not concerned with demonstrating that consciousness is evolving, nor to substantially review the existing literature that has demonstrated this. Additional research has further explored this literature and identified several threads in the discourse (Gidley, 2006, 2007c).

At a further level of analysis it became apparent that much of the research operated from within fairly tight disciplinary boundaries. Disciplinary research is unquestionably important to shed light on detail and it has been used in this research in that manner. It is not necessarily helpful in facilitating the big-picture perspective required for this research. Consequently, the second exclusion category concerned literature that drew primarily from just one or two disciplines. In other words transdisciplinary and/or integral research has been privileged in my research.

As a final point of self-reflection, perhaps in the end my choice of Steiner, Gebser and Wilber was also influenced by the intuitive resonance I felt with all their work, and the fact that I felt that I was in a unique position—based on my experience and interest—to do this research.[64]

A brief summary of the methodologies of Steiner, Gebser and Wilber will be followed by a summary of my own methodology and process.

---

[63] I am using the term *formal operations* here to denote both a stage of individual cognition and also to represent the general evolutionary stage that Gebser called mental/rational.

[64] I have a twenty-five year history of studying, working and living with Steiner's philosophy, including founding and pioneering a Steiner school in Australia over ten years (up to 1994), and undertaking a Master of Arts (research) involving Steiner-educated Australian students (Gidley, 1998b, 2001b, 2002b). I also became an executive member of the Integral Education committee of Wilber's Integral University over two years, and participated in an Integral Life Practices seminar run by Integral Institute in 2005.

Steiner's Research Methodology[65]

Although much of Steiner's writing, particularly prior to the turn of the 20th century, was purely philosophical—in the traditional academic manner of his day—much of his later work was based on what he referred to as his spiritual-scientific research. Steiner (1904/1959) discussed his research methods in his book *Cosmic Memory* where he detailed much of his research on early periods of pre-history. He claimed that, as a result of decades of disciplined thought practice, he was able to read information that was stored in what he called the *Akasha record/chronicle*. Ironically, some of the terms Steiner used to characterize his spiritual-scientific[66] methodology—such as *cosmic memory* and *Akashic record* are currently being re-introduced into the scientific discourse by László: "Ervin László's concept of the Akashic Field includes the idea of cosmic memory" (Sheldrake, 2006, abstract).

Before going into Steiner's method in more detail, I would like to contextualize it from within László's (2007) theory of an enduring *In-formation Field* that, under special circumstances, can be *read*. The following extract from László's recent book, *Science and the Akashic Field*, bears remarkable similarity to Steiner's descriptions.

> The evidence for a field that would conserve and convey information is not direct; it must be reconstructed in reference to more immediately available evidence. Like other fields known to modern physics, such as the gravitational field, the electromagnetic field, the quantum fields, and the Higgs field, the in-formation field cannot be seen, heard, touched, tasted, or smelled . . . it seems evident that a further field is required to account for the special kind of coherence revealed at all scales and domains of nature, from the microdomain of quanta, through the meso-domain of life, to the macrodomain of the cosmos . . . In my previous books I named the universal in-formation field the Akashic Field . . . In the Sanskrit and Indian cultures, Akasha is an all-encompassing medium that underlies all things and becomes all things. . . . Our bodily senses do not register Akasha, but we can reach it through spiritual practice. The ancient Rishis reached it through a disciplined, spiritual way of life, and through yoga. (p. 73-76)

Steiner spent the last 25 years of his life developing and consolidating a methodology of thought training/discipline. He claimed that, if practiced, these methods could lead to new levels of cognitive and psycho-spiritual development, building on the rigorous methods of the natural sciences. Although his methods are claimed to lead to spiritual perception, they should not be confused with pre-rational, mythic, atavistic methods.[67] He practiced these methods himself and his research methodology proceeds from them. I have included a rather long quote here, as I believe it is important to read Steiner's own words on these matters. The practice Steiner refers to appears to be aligned with László's claims above. If what Steiner and László are claiming is valid, then it is of major significance and requiring far more substantive research attention than has currently been given. Steiner (1904/1959) states:

---

[65] I have given extended space to a discussion of Steiner's methodology for acquiring knowledge—compared with Gebser and Wilber—as his methods are the most heterodox and arguably the least understood.

[66] Steiner referred to the overall corpus of his work as spiritual science, as he extended natural scientific methods to research what he called the spiritual or *supersensible world*. A forerunner to this was Goethe's *delicate empiricism*, discussed elsewhere and William James' *pragmatism* (Gitre, 2006).

[67] Steiner actively disapproved of the pre-rational, atavistic methods of *so-called spiritual research* of the Theosophists as not appropriate methods for his times as did Sri Aurobindo. Both wrote of these matters critically, strongly distancing themselves from the methods and activities of the Theosophical Society at the time (Aurobindo, 1997; Steiner, 1925/1928).

> By means of ordinary history [humans] can learn only a small part of what humanity experienced in prehistory. Historical documents shed light on but a few millennia. . . . Everything belonging to the external world of the senses is subject to time. In addition, time destroys what has originated in time. . . . Everything which comes into being in time has its origin in the eternal. But the eternal is not accessible to sensory perception. Nevertheless, the ways to the perception of the eternal are open for [humans]. [We] can develop forces dormant in [us] so that [we] can recognize the eternal[68] . . . from transitory to non-transitory history . . . written in other characters than is ordinary history. In gnosis and in theosophy it is called the "Akasha Chronicle." Only a faint conception of this chronicle can be given in our language. For our language corresponds to the world of the senses. That which is described by our language at once receives the character of this sense world . . . The one who has acquired the ability to perceive in the spiritual world comes to know past events in their eternal character. They do not stand before [us] like the dead testimony of history, but appear in full life. In a certain sense, what has happened takes place before [us]. Those initiated into the reading of such a living script can look back into a much more remote past than is represented by external history; and—on the basis of direct spiritual perception—they can also describe much more dependably the things of which history tells. (pp. 38-40)

Although the latter statement of Steiner's is a somewhat radical truth claim for a method of research that is difficult to validate, he does qualify his claims in various ways, as for example in the following two quotes:

> In order to avoid possible misunderstanding, it should be said that spiritual perception is not infallible. This perception also can err, can see in an inexact, oblique, wrong manner. No man is free from error in this field, no matter how high he stands. (Steiner, 1904/1959, p. 41)

It will be evident in the narrative that some of Steiner's findings from his research are only recently being rediscovered and formalized into scientific theory. László's (2007) theory of the Akashic field itself, is an excellent example of this process. Steiner (1954/1981a) also qualifies the difficulties in this process:

> We must take all this as but approximate description, for we are bound to words which are coined for things only come into existence in our Earth period.[69] We should first have to

---

[68] At this point in the text Steiner (1904/1993) refers to his book: *Knowledge of the Higher Worlds: How is it Achieved.* This is his primary introduction to how to develop this type of cognition.

[69] Steiner held a view similar to some of the latest cosmology theories on meta-verses. He would be referring to our current evolutionary cycle.

> invent a language if we would express what is seen by the eye of the Seer. All the same these descriptions are important, for they are the first way of coming to the truth. Only through picture, through imagination do we find the way to vision. We should make no abstract concepts, mechanical schemes, nor draw up diagrams of vibrations, but let pictures arise within us; that is the direct path, the first stage of knowledge. (p. 113)

As an echo of Steiner's words, László (2007) also writes of the importance of expressing the visions of the Akashic field, not just through science but also through poetry. He spends several pages writing poetically of his own Akashic vision of the birth and rebirth of our universe "addressed not to our intellect, but to our heart" (pp. 129-133. László's text is not greatly dissimilar in tone from some of the passages in Steiner's books, demonstrating further congruence between their works.

Steiner (1930/1983a) has written substantially about the search for truth, with some of his statements indicating that he had something of a postmodern sensibility in regard to the notion of *truth*.

> Since truth is manifold in meaning, all we can reasonably say is that [humans] must set out to grasp truth and to kindle in [themselves] a genuine sense of truth. Hence we cannot speak of a single, all-embracing truth. (p. 34)
>
> There are no grounds at any time for remaining content with something already known. (p. 50)

Steiner developed his evolutionary theories in a time when many controversial socio-cultural models were in vogue. However he eschewed their materialistic biological underpinnings and their simplistic unilinearity. Although his theoretical approach was unquestionably developmental, a basis of much of his writing was aimed at significantly broadening 19th century notions of human development and evolution. As will be demonstrated below, his early 20th century writings on the evolution of consciousness and spiritual development foreshadowed contemporary notions of the emergence of postformal-integral consciousness, conscious evolution and the emergence of moral imagination,[70] and to some degree the new biological theory of emergentism (Steiner, 1894/1964b).

> The appearance of completely new moral ideas through moral imagination is, for the theory of evolution, no more miraculous than the development of a new animal species . . . Ethical individualism, then, is the crowning feature of the edifice that Darwin and Haeckel have striven to build for natural sciences. It is spiritualized theory of evolution carried over into moral life . . . the free moral life [is] the spiritual continuation of organic life. (pp. 165-166)

This statement encapsulates how Steiner's epistemology represents a dialectical integration of scientific and spiritual features into his *spiritual science*.

---

[70] Steiner wrote about the link between the moral imagination and Darwinism, foreshadowing recent research by Loye's Darwin Project (Loye, 1998, 2004; Steiner, 1914/1973c, 1894/1964b, 1971c).

Gebser's Research Methodology

Unlike Steiner and Wilber, whose writings encompass vast territories, Gebser's interest was primarily consciousness evolution—particularly the emergence of integral consciousness—through what he saw as cultural mutations or sudden leaps. In an article, first published in German in 1956, but not translated into English until 1996, Gebser discusses the contribution of cultural philosophy towards facilitating the emergence of integral-aperspectival consciousness. He described this methodology of cultural philosophy as proceeding through phenomenological, comparative, coordinating and finally reductive work. I will summarize these four stages as follows including extracts of his words:

- Firstly, "comprehending the results of the various natural sciences and humanistic disciplines"—as a type of cultural phenomenology;
- The second step is "to compare the individual phenomena;"
- Thirdly, the task is to "coordinate these phenomena to bring out their common denominator;"
- Finally, there is an attempt to "reduce the most diverse by thematically related phenomena to the elements of their fundamental structure" (Gebser, 1996a, p. 80).

Intriguingly, this process appears very similar to Wilber's methodology of *orienting generalizations* discussed below, though I am not aware of any source where Wilber makes this connection or whether he is even aware of this particular article or of Gebser's stated methodology. This could provide further important theoretical grounding for Wilber's methodology.

Gebser also considered his work to have been indirectly influenced by Sri Aurobindo. In another context, Gebser stated that he first became aware of his concept of the formation of a new consciousness "by a flash-like intuition in the winter of 1932-33. . . . I see an explanation for this phenomenon in the fact that I was in some way brought into the extremely powerful spiritual field of force radiating through Sri Aurobindo" (Mohrhoff, 1992, p. 1). Gebser acknowledges that such an insight only has personal validity, but that he spent the next 17 years in deep, scholarly research and that the "quotations and references to such sources are intended to lend a generally valid evidential character to the personal validity of the original conception" (Gebser, 1949/1985, p. xxviii).

Elsewhere, Gebser (1949/1985) summarized the intent of his methodology as follows: "Our 'method' is not just a 'measured' assessment, but above this an attempt at 'diaphony' or rendering transparent" (p. 7).

Gebser's *truth* claims are integrated with his entire approach. The way that he has endeavored to characterize the various structures of consciousness by enactment and illustration as well as explanation, is integral to his methodology of what he calls "imparting of truth." His notion of truth however is not merely a concept, but an attempt to enter into the depth of things and to render them transparent.

> Integral reality is the world's transparency, a perceiving of the world as truth: a mutual perceiving and imparting of truth of the world and of man and of all that transluces both. (Gebser, 1949/1985, p. 19)

Clearly, his notion of truth is not static.

Gebser's context was different from Steiner's in that he had experienced first-hand the catastrophic results when Social Darwinism was hybridized with Nazism. In this seminal work on consciousness, he (Gebser, 1949/1985) problematizes terms such as *evolution*, *development* and *progress* referring to their serious limitations in the following words. "The rationalistic thought-cliché of "progress" (more often than not a progression away from origin) the biologizing notion of evolution, and the botanizing idea of development are all inapplicable to the phenomenon of consciousness" (p. 38-39). He throws further light on this view in his last book—which is not yet officially available in English—but first published in German in 1970, three years before his death. A recent informal translation (Gebser, 1970/2005) indicates the distinction he makes between his alternative view and the evolutionary theories of his day.

> Evolution is in this view neither progress nor development, but crystallization of the invisible in the visible, that should be achieved by adequate work . . . The presently valid evolutionary theories including that of development and progress are hardly older than 100 years. They deal merely with one part of reality . . . i.e. only the visible and conclusive. The total reality as far as it is accessible to us comprises however also the other half that is invisible to us.

Later, in that document, he endorsed the involution theories of Sri Aurobindo, which clearly underpinned his evolution of consciousness approach.

Wilber's Research Methodology

Wilber refers to his main methodology as *orienting generalizations* which he describes in the following way: "If we look at the various fields of human knowledge—from physics to biology to psychology, sociology, theology and religion—certain broad, general themes emerge, about which there is very little disagreement"[71] (Wilber, 1996a, p. 17). Expanding on his methods for constructing his theory, Wilber (1996) continues:

> If we take these types of largely-agreed-upon orienting generalizations from the various branches of knowledge . . . and if we string these orienting generalizations together, we will arrive at some astonishing and often profound conclusions, conclusions that, as extraordinary as they might be, nonetheless embody nothing more than our already-agreed-upon knowledge. . . . In working with broad orienting generalizations, we can suggest a broad orienting map of the place of men and women in relation to Universe, Life and Spirit. (p. 18)

---

[71] This is perhaps one of the more contested areas of Wilber's approach.

Wilber's overall 'integrative method' is further detailed by Jack Crittenden in the *Forward* to Wilber's *The Eye of Spirit*, (2000d) and described as having three steps. I have summarized Crittenden's description of these three steps as follows:

- Wilber develops the orienting generalizations within each field of study—"a type of phenomenology of all human knowledge conducted at the level of orienting generalizations."
- "Wilber then arranges these truths into chains or networks of interlocking conclusions. At this point Wilber veers sharply from a method of mere eclecticism and into systematic vision." Crittenden claims that at this point Wilber asks himself: "What coherent system would in fact incorporate the greatest number of these truths?"[72]
- "The third step in Wilber's overall approach is the development of a new type of *critical theory*." Crittenden explains that once Wilber has developed his optimum schema (eg AQAL) he then critiques the partiality of the narrower approaches. "He criticizes not their truths, but their partial nature" (pp. xiii-xiv).

In regard to his own truth claims, Wilber gives mixed messages. In a discussion of what he calls *broad science*—or even *spiritual science*—he claims that all "truth claims [can be] guided by the three strands of valid knowledge (injunction, apprehension, confirmation; or exemplars, data, falsification) *applied at every level* (sensory, mental, spiritual)" (Wilber, 1998, p. 174). In other contexts he honors the role of pluralism and relativism in truth claims. Yet he positions his integral theory above other theories, suggesting that his tacit bias may be to believe that his theory is more "true" than others.

In the foreword to the second edition of *Up from Eden*, Wilber tackled head-on what he sees as the major critiques against evolution theory that still hampered the appropriate development of the evolution of consciousness theory at the time he was writing. Wilber (1996c) claims that there has been considerable opposition to the notion of cultural and consciousness evolution—from the traditionalists, because evil is still happening; the Romantics, who hark back to the past; and from the liberal social theorists, reacting to the horrors of Social Darwinism. He then puts forward several arguments for cultural evolution, particularly drawing on Habermas' notion of the *dialectic of progress*. He also points to the "distinction between differentiation and dissociation," "the difference between transcendence and repression," "the difference between natural hierarchy and pathological hierarchy," and how "higher structures can be hijacked by lower impulses" (pp. xi-xiv). These are important theoretical contributions to the discourse.

My Postformal Research Methodology—a Theoretical *Bricolage*

> *[A bricoleur-theorist* is one who] works between and within competing and overlapping perspectives and paradigms. (Denzin & Lincoln, 2005, p. 6)

---

[72] This description of Wilber's methodology appears to reflect his enactment of postformal thinking processes such as 'systematic' or even 'metasystematic' reasoning, as identified in seminal developmental psychology research on postformal stages (Commons & Richards, 2002).

> In its embrace of complexity, the bricolage constructs a far more **active** role for humans both in shaping reality and in creating the research processes and narratives that represent it. (Kincheloe, 2005, p. 324)

Before examining my unique methodological approach, I wish to identify the mood of soul in which I undertook the research. I entered a mood of critical reverence,[73] integrating heart and mind in a way that both honored the huge contributions of Steiner, Gebser and Wilber, yet retained a critical mind.

To assist with understanding of the overall framing of this research within the larger project, I have included a table showing the layered framing of the research in which this paper is situated (See Table 1).

Table 1: A Layered Research Framing

Type of Inquiry	***Conceptual Research***[74]
Substantive Conceptual Content	Evolution of Consciousness
Pragmatic Interest	Cultural Pedagogical Practice[75]
Philosophical Interests	Integral[76] Evolutionary Philosophy
Epistemology	Transdisciplinarity
Methodology	Theoretical Bricolage

Source: (Gidley, 2007b)

Undertaking postformal or integral research presents several methodological challenges. With a topic as far-reaching as the evolution of consciousness these challenges are multiplied in manifold ways. However, because of the complexity of the research topic and the transdisciplinary[77] epistemology (Grigg, Johnston, & Milson, 2003; Nicolescu, 2002; van den

---

[73] It is worth noting that several researchers include *reverence* as a postformal quality, particularly in the education research (Gidley, 2007a; Miller, J. P., 2000; Miller, R. 2000).

[74] *Conceptual research* is a term used in social science research such as psychology, psychotherapy and psychoanalysis for research that is not empirical or clinical (Young, 1995).

[75] *Cultural pedagogical practice* is a phrase used in the critical pedagogical philosophy of Henry Giroux (1998), who acknowledges that education does not just take place in schools and universities but in multiple sites as also reflected in my research where I use the broader term *youth enculturation*, in addition to *education* or *schooling*.

[76] My use of the term *integral* incorporates at least the composite meaning of *postformal-integral-planetary*.

[77] "Transdisciplinarity is . . . radically distinct from multidisciplinarity and interdisciplinarity because of its goal, the understanding of the present world, which cannot be accomplished in the framework of disciplinary research. The goal of multidisciplinarity and interdisciplinarity always remains within the framework of disciplinary research" (Nicolescu, 2002).

Besselaar & Heimeriks, 2001) it was too limiting to use one singular research methodology. In my search for a suitable methodology that could hold all of these perspectives, the postformal methodology of *bricolage*[78] has emerged as the most appropriate. Specifically my *theoretical bricolage*,[79] includes hermeneutics (Bruns, 1992; Demetario III, 2001; Foucault, 2005; Habermas, 1986; Palmer, 1969; Ricoeur, 1986; Wachterhauser, 1986); narrative inquiry (Bocchi & Ceruti, 2002; de Beer, 2003; Montuori, 1999); and feminist methods such as intuitive and organic (Braud & Anderson, 1998). As indicated in the section above, it is also informed by a variety of philosophical perspectives such as integral theory, postmodern philosophy, and futures studies. However, in spite of the plethora of methods that have contributed in some way to this research, the primary methodology used for the analysis is hermeneutics: specifically an in-depth textual analysis of the theoretic narratives of Steiner, Gebser and Wilber.

Hermeneutics as a research methodology in the social sciences has developed over several iterations, from its original roots in Biblical exegesis. There has been much debate in recent decades about the different versions of hermeneutics. The most notable debate was that between Gadamer (1986a) and Habermas (1986). Gadamer's more traditional, philosophical hermeneutics—by his own admission—draws on the early Romantic phase of hermeneutics. Habermas' critical hermeneutics arose from critical theory. French philosopher, Ricoeur called it the *hermeneutics of suspicion*, linking it with the rationalist stream coming from the European Enlightenment (Ricoeur, 1986). Ricoeur has attempted to find reconciliation between these two opposing camps.

This research draws strongly on the hermeneutic approach of Ricoeur. Ricoeur (1986) identified two major approaches to hermeneutics, in the sense that it is about understanding symbolic texts, which have multiple meanings. He refers to one as the *hermeneutics of suspicion*, which seeks to destroy the symbol as the representation of a false reality, destroying "masks and illusions in a relentless rational effort at "demystification" (Palmer, 1969, p. 44). The other approach—*demythologizing*—"deals lovingly with the symbol in an effort to recover meaning hidden in it" (Palmer, 1969, p. 44). It is my intention in this paper to *demythologize* the narratives of Steiner, Gebser and Wilber, in the sense that Ricoeur uses the word.

As an outcome of Ricoeur's hermeneutic reconciliation of the Gadamer-Habermas debate, he developed an integrated approach to hermeneutics that I have utilized. Wilber (2000d) has also developed an approach to hermeneutic interpretation, based on the four quadrants component of his integral framework. Because it is so aligned to Ricoeur's approach, I have included an annotation related to Wilber's quadrants in my summary below. It is worth noting that although

---

[78] Interestingly, from a transdisciplinary perspective, Derrida (2001) also discusses the value of Levi-Strauss's use of bricolage in critical analysis of all discourse. "If one calls *bricolage* the necessity of borrowing one's concept from the text of a heritage which is more or less coherent or ruined, it must be said that every discourse is *bricoleur."*

[79] The notion of "theoretical *bricoleur"* was introduced by Denzin and Lincoln (2005). *Bricolage*—the process and product of the *bricoleur*—has been substantially developed as a postformal educational research methodology by educational researchers Joe Kincheloe and Shirley Steinberg drawing on a wide range of philosophies, epistemologies and methods such as critical theory, ethnography, hermeneutics, postmodernism, poststructuralism (Kincheloe, 2001, 2005; Kincheloe & Berry, 2004; Kincheloe, Steinberg, & Hinchey, 1999).

Wilber makes brief mention of Ricoeur's work, he does not mention the close relationship between their positions as indicated below. It is unclear why this might be the case.

In brief, in Ricoeur's (1986) section *Critical reflection on hermeneutics* where he examines Gadamer's position with "a critical eye," he speaks of four ways to approach a hermeneutic analysis—through the *fundamental phenomenon of the text* and through what he calls the *threefold autonomy of the text*.

- The autonomy of the text—the fundamental phenomenon—aligns to Wilber's Upper Right quadrant (UR);
- Autonomy of the text with respect to the intention of the author, aligns to Wilber's Upper Left (UL);
- Autonomy of the text with respect to the cultural and sociological conditions of the text. It is most likely that Ricoeur is using cultural and sociological in the sense of Wilber's Lower Right (LR);
- Autonomy of the text with respect to the "original addressee." This appears to relate to Gadamer's *reader response factor* and would thus align to Wilber's Lower left (LL). (pp. 328-329)

Most of my hermeneutic analysis throughout the main narrative in this paper relates to the first two of Ricoeur's points. In other words my own interpretive task is a hermeneutic dance between the autonomy of each author's actual text (Wilber's UR)—the major reason that I have engaged in such lengthy quoting—and my best interpretation of their original intent (Wilber's UL). The major influences on *how* I interpret their original intent from the actual text are related to the historico-cultural (Wilber's LL) and sociological (Wilber's LR) circumstances of the three authors and myself. In hermeneutic analysis, the best way to improve the validity of the research is to be as transparent as possible in relation to such socio-cultural contextual features as may influence interpretation through hidden biases. The following section attempts to create transparency in these domains.

A Hermeneutic Contextualization

Steiner,[80] Gebser and Wilber—Perspectives on Socio-Cultural Contexts

I do not believe that Rudolf Steiner (1861-1925), Jean Gebser (1905-1973) or Ken Wilber (born 1949) need a formal introduction in this particular journal. However I will briefly comment, for hermeneutic transparency, on the cultural context of each. A notable fact is that neither Steiner nor Gebser is still alive, whereas Wilber is a contemporary, like myself. I may have cultural biases in this regard and in due course will attempt to make those explicit.

Interestingly, both Steiner and Gebser were central Europeans who moved to Western Europe. In spite of the somewhat unique flavors of these stimulating European cultures where they lived, they both participated intellectually and spiritually—though without contact with each other—in the major cultural flourishing that took place in the early 20th century.[81] This included a new openness to Eastern, particularly Indian, spirituality and culture. Gebser himself referred to this extraordinary cultural-scientific-philosophical-artistic flourishing as demonstration of the breaking through of the new integral consciousness structure. They also both witnessed Europe being torn apart by war.

---

[80] I have listed the names here and in the title chronologically, in relation to the timing of their births—Steiner (1861-1925), Gebser (1905-1973), Wilber (born 1949).

Steiner was born in Croatia, spent his childhood in Austria, then lived and worked mainly in Germany, until escaping to Switzerland after the 1st World War, where he remained living and working until his death. However, from the turn of the 20th century, when he began his more active spiritual-scientific work, he traveled extensively in western and central Europe and the UK, to lecture and collaborate with other academics and professionals. Steiner referred to the approach that he took with his work as spiritual science, or *Anthroposophy*.[82]

Gebser was born in Poland, but spent much of his adult life in Italy, Spain and France being friends with Spanish artists and poets, such as Pablo Picasso, and Federico García Lorca. Gebser, like Steiner, also had to escape to neutral Switzerland, being fortunate to leave Paris just prior to the German invasion and enter Switzerland only hours before the borders were closed. He referred to the kind of research he undertook as cultural philosophy (Gebser, 1996a). Gebser obviously also took part in the further cultural-philosophical developments of his times as he lived, for another forty-eight years after Steiner.

By comparison with Steiner and Gebser, Wilber's external cultural context—mid-20th century North American—would appear somewhat bland. In his childhood he would have imbibed—either explicitly or implicitly—the mid-western American early television culture of *Cowboys and Indians*.[83] Later in his adolescence and early adulthood he would have been enculturated—even if unconsciously—by American scientism, politico-global hegemony, economism and the reduced versions of modern and postmodern philosophy that seem to have arisen out of this broader hybridization of science-politics-economics for which 20th century USA has been notorious.[84] On the other hand, the waves of new consciousness that swept the Western world in the sixties and seventies originated in the USA and have contributed a powerful shaping influence on the worldviews of people growing up in those times. Additionally, Wilber, as an adult, clearly took his own enculturation and inner development in hand during the 70's and beyond with his immersion in Eastern spiritual traditions and western philosophy and psychology and his extensive self-education in many fields of study.

---

[81] The outstanding individual contributions to an integralization of the noosphere include Einstein, Steiner, Whitehead, Bergson, James, Dewey, Sri Aurobindo, Tagore—to name just a few in the Indo-European lineage. Richard Tarnas (2006) indicates connections between these philosophical-cultural movements and the movements of cosmic proportions also occurring during the first two decades of the 20th century. I must confess to relative ignorance of parallel developments in other cultures that I imagine have occurred and would be most interested if readers can inform me on this gap.

[82] Anthroposophy could be described as the wisdom of the human being.

[83] This may have some bearing on Wilber's occasional use of *cowboy* metaphors when discussing his critics—a residue of cultural shadow perhaps?

[84] For further academic analysis on the Americanization of postmodern philosophy, refer to Hampson (2007).

In summary, it is my interpretation that some contextual biases arise from this material.

- Gender bias: all three are male and also mostly use the masculine gender when speaking about human beings;
- Eurocentrism: all three are of European descent and there is evidence of Eurocentrism at times in all of their work;
- Indo-Euro-centrism: there is also evidence of an Indo-European cultural and spiritual heritage in all three, though Gebser demonstrates more cultural breadth than the other two in some of his examples;
- All three are biased in favor of progressive and developmental notions of individual and socio-cultural evolution, however they also in different ways problematize such concepts in terms of how they have been used previously. Nuances between them will be uncovered throughout the text.
- Spiritual orientation: all three are critical of the materialist worldview and promote spiritual perspectives. Although none of them are fundamentalist or even sectarian, Steiner and Gebser demonstrate a stronger Christian bias, perhaps related to their cultural contexts. Wilber by contrast demonstrates a bias toward Eastern spiritualities, especially Buddhism;[85]
- Aesthetic orientation: Steiner and Gebser are both strongly oriented towards the aesthetic dimension in the emergent consciousness they characterize, while Wilber is more cognitively oriented;
- Additionally, Wilber appears to be both Anglophone and somewhat American-centric in his orientation.

Perspectives on My Cultural Context

And what is my own cultural context, my own story? As an Anglo-Australian, not fluent in any other languages, I am aware that my own research is biased by my inability to access relevant material in other languages, unless it has been translated into English. I also have to admit that the cultural context of my own childhood in suburban Australia was probably as bland as Wilber's. Overall, I imagine I have been subjected to several similar cultural and *Zeitgeist* influences to Wilber. We were both children in the fifties, adolescents in the sixties and young adults in the seventies. These are some of the things that have made studying Wilber comfortable for me and may hide some tacit biases. However, I didn't much enjoy the American *westerns* that were offered on TV. Rather, I preferred to draw, read books, knit and daydream. Thankfully, I have little interest in metaphors of war and conflict, including academic "culture wars" or "turf wars." Also, I am a woman, mother, educator, psychologist and futures researcher.

I will proceed to briefly discuss how I am constructing my emphasis with regard to each. By making explicit the biases that I am aware of, I also hope to make more transparent any tacit potential biases that may have slipped my attention. I have been aware for some time however that Steiner's substantial contribution to world philosophy has been strikingly overlooked particularly in the Anglophone academic world. I recognize this is largely because his primary, early 20th-century-German writings are very difficult for many contemporary scholars to read and understand, even when translated. Also the explicitness about spirituality[86] in his writings may have been unpalatable to academics until probably the last decade when there has been a shift—at least in the Anglophone academic world. Gebser's work appears to have been similarly overlooked. Over the last decade I have pursued a strong interest in studying/researching many integrative philosophies and theories. When I came to Wilber's work a few years ago I intuitively felt a strong resonance between his and Steiner's work and began to research Wilber in more depth. I was surprised to discover that he had not included any in-depth study of Steiner's extensive writings on the evolution of consciousness. This was in spite of the espoused comprehensiveness of Wilber's synthesis of significant integral theorists in this area. I felt inspired to address this significant gap in the growing integral knowledge base and deepened my research with a view to a postformal integration of Steiner's and Wilber's work. As I immersed myself in the primary sources[87] that Wilber refers to I became increasingly aware of the significance of Gebser's research in its own right, particularly in regard to the scholarship of both his theory and his phenomenology. In order to extend the rigor of my analysis of Steiner and Wilber I decided to use Gebser's structures of consciousness to provide a scaffold to anchor my analysis, thus foregrounding his work. Overall, it is my intention to give a relatively equitable focus to each of their contributions, though not in a mechanical way. As an exception, there are two areas of discussion where I have emphasized Steiner's narrative more strongly, because he has made significant additional theoretical contributions—the impact of astronomic cycles and rapid geo-climatic events on culture and consciousness movements, and the transition between Gebser's magic and mythical structures. I have also chosen in some places to do more direct interpretive quoting from Steiner's work as it is the most dated and difficult and thus the least accessible. By contrast, Wilber's writing is readily available and relatively easy to read and thus paraphrase.

---

[85] I wonder if the cultural context for this may be as a reaction to some of the fundamentalist strands of Christianity prevalent in the USA. This has been called Wilber's *Pacific* philosophic tendency in contrast to the *Atlantic* philosophic tendency of Steiner and Gebser (Benedikter, 2005).

In summary, my reconstructed narrative that draws on the other three, endeavors to balance most of their biases. However, upon reflection, I note that I have actually intensified others to counterbalance the tacit bias in the dominant evolution of consciousness discourse.

- Gender bias: as a woman I provide some balance to the gender bias and endeavor to use gender neutral language myself. However, on further reflection, I wonder why I primarily drew on three male authors—a tacit cultural bias perhaps?
- Eurocentrism: I am also of European descent but have endeavored to balance the Eurocentrism where possible, though I am limited by my lack of other languages;
- Indo-Euro-centrism: I have become aware through this research of my own tacit bias in this direction and have endeavored to address this where possible;

---

[86] Some of Steiner's books and lectures use the term *occult* in their titles. He did this deliberately because his whole purpose was to bring into the light of day—through his scientifically and philosophically grounded epistemology—a methodology for accessing knowledge that had previously been *hidden*—that is, *occult*—in Church dogmas and secret societies. The dialectical title *Occult Science*, for one of his major books, was an attempt to make this task explicit (Steiner, 1910/1939).

[87] While I have also begun to enter into the significant contribution of Sri Aurobindo in this area, in order to bound this research into a manageable size, I have had to leave the delight of more fully engaging his work for a future time.

- I am also biased in favor of progressive and developmental notions of individual and socio-cultural evolution and yet also problematize these concepts in terms of how they have been used in modernist discourses;
- Anglophone centrism: I have become aware of my own Anglophone centrism during this research and have endeavored to address it up to the limits of my language skills;
- Spiritual orientation: I also share this bias and have retained it consciously as it is a balance to the dominant discourse which is biased towards scientific materialism;
- Aesthetic orientation: I also share a bias towards the aesthetic dimension. I have chosen to retain it as a balance to the cognicentrism in the dominant discourse, including much of the integral discourse;
- Finally, I am probably a postformal romantic philosopher seeking to salvage remnants of the enormous contribution of the German Idealists and Romantics[88] and proflect them into the future.

My own truth claims are rather humble. I am aware that some of the "data" I present from my three major sources is scientifically unorthodox. I am not claiming that this data is *factual* in a fixed way that can be argued from the perspective of other apparently opposing scientific *facts*. Nor do I think that the current state of scientific knowledge of our deep past and potential futures is the final word. As Foucault and others have demonstrated there are many versions of history. My intuition tells me that there are many versions of evolution of consciousness, and science has not yet discovered them all. My narrative complexly interweaves the honest, authentic life work of three heterodox integral scholars and I intuit that there may be more than a thread of "truth" in what they say. We have seen scientific theories change dramatically over time, and scientists themselves admit that the new insights that drive their research often come from their imaginations, or from intuition. As László (2006) states:

> Bruno, Galileo, Copernicus, Kepler, and Newton himself had deep intuitive, even mystical streaks. Nor did intuition lack in the giants of twentieth-century science. As their writings testify, it was a leading element in the thinking of Einstein, Erwin Schrödinger, and Neils Bohr, as well as Wolfgang Pauli and Carl Jung, to mention a few. (pp. 59-60)

I have primarily sought to broaden and deepen the evolution of consciousness discourse, to bring new narratives to the table: the table where *truth* is a movable feast.

Having established the philosophical, theoretical and methodological context, I will now introduce the main narrative in which I integrate the three individual narrative threads of Steiner, Gebser and Wilber, into a larger creative tapestry.

---

[88] I note also that Wilber does not give a positive picture of romantic philosophers or eco-philosophers—and I question much of his evidence for this. I suggest that the influence on integral theory of this apparent bias also needs some balancing.

2. A Macrohistorical Planetary Tapestry: The Fascinating Integral Narratives of Steiner, Gebser and Wilber

A Circumnavigation of the Topic

> The dialectical challenge felt by many is to evolve a cultural vision possessed of a certain intrinsic profundity or universality that, while not imposing any a priori limits on the possible range of legitimate interpretations, would yet somehow bring an authentic and fruitful coherence out of the present fragmentation, and also provide a sustaining fertile ground for the generation of unanticipated new perspectives and possibilities in the future. (Tarnas, 1991, p. 409)

We live in an hour of grand transition. The tensions between rival worldviews, globally and locally, cry out for mediatory perspectives. Many perceive the current global tumult as evidence of break*down* of culture and with it the safety of the *familiar*. They posit their various solutions, such as: the secular neo-liberal economics of globalization, a return to religious fundamentalism, *cures* for emotional and psychological despair, or just plain war.

Others, like myself, perceive signs of luminous break*through* everywhere.

Is my response—and that of others I resonate with—simply a regressive retreat to romantic naivety? Or might it reflect a transcendence of the worn-out solutions of the "already said?" Might it open up fresh possibilities that lie hidden in the textural—and textual—folds of a delicately re-woven noospheric tapestry? *But* . . . in the wake of postmodernism will I be *allowed* to re-weave a new *macro*-narrative from the unraveled threads of Lyotard's "incredulity towards metanarratives," and Derrida's gift[89] of deconstruction? Perhaps my postcritical *naiveté* may be emboldened by the *écriture feminine* of Héléne Cixous (1991), or what Ursula Le Guin (1989) calls *the native tongue of the individual*[90]—a new way of languaging that is "the coming together, the marriage of the public discourse and the private experience, making a power, a beautiful thing, the true discourse of reason." Yet Lyotard, Derrida and others[91] need to be honored for deligitimizing and deconstructing many of the grand narratives and taken-for-granted assumptions of the modernity project, that were colonizing our global mind-space. Particularly relevant to evolution of consciousness research was the deconstruction of Social Darwinism, which in an unproblematized form has been used for racist purposes.

---

[89] Derrida's deconstruction is often regarded as a negative and nihilistic *destructive* contribution. However as Benedikter and Hampson—and a reading of Derrida's own writing— demonstrate, this is largely a misinterpretation (Benedikter, 2005; Derrida, 1995; Hampson, 2007).

[90] Le Guin contrasts this with two other types of language that she calls the "father tongue" (the language of science and politics) and the "mother tongue" (the language of relationships or that spoken by the mother to her children).

[91] There has clearly been some overlap between this therapeutic unraveling of the hegemonic aspects of modernity by postmodern philosophers, and the diverse works of feminists, artists, critical futurists and many post-colonial scholars too numerable to mention.

It is interesting to consider the diversity of myths that existed in the noosphere[92] prior to its colonization by mental-intellectual-rational thinking, then to consider the even greater diversity of mental-intellectual-rational concepts and discourses that have evolved over the last two millennia—notwithstanding the more recent modernist tendency toward scientific hegemony. In this context, how could we not be enthusiastic about the vast potential of integral theories, discourses, narratives and languages that are only recently beginning to emerge on a planetary scale? Among others the integral narratives of Steiner, Gebser and Wilber each offer potential ways to transcend both the illegitimate aspects of earlier grand narratives and the narrative vacuum that has arisen in their place. One of the dangers inherent in such vastly integrative approaches is the potential for philosophic arrogance either in the originator or their followers.[93] Any claim to universalist supremacy in the emerging integral noospheric space may indicate such a shadow. My hope is to contribute to integral *noospheric diversity*[94] by counter-pointing all three narratives.

I offer this contribution to integral theory by way of a four-dimensional article—that in turn encloses a four-strand narrative[95] as its structural anchor—a gesture towards stretching our noospheric vitality, imagination and concepts into future times and cosmopolitan spaces. This article honors the evolutionary life-works of Steiner, Gebser and Wilber with creative, critical reverence. It is a long piece of writing, but not, I hope, too long to be enjoyed. I invite the reader to consider taking the journey—not as one might drive through a fast food outlet, but—as one might wander through a museum or art gallery, taking time to ponder and reflect along the way.

An Articulation in Four Dimensions

> The concept of the "four-dimensional continuum" as "curved space" thus holds the incipient possibility of realizing the *integrum*, the "four-dimensional" transparent "sphere in motion." (Gebser, 1949/1985, p. 352)
>
> I investigate from one particular aspect . . . and then I investigate three more aspects. . . . In walking round the topic as it were, we are presenting an artistic image of the matter. If one is not aware of this, nothing will be achieved but abstractions and a sclerotic reproduction of what is previously known. (Steiner, 1930/1983b, p. 15)

---

[92] Noosphere is a term popularized by Vladimir Vernadsky and Pierre Teilhard de Chardin who referred to it as "the envelope of thinking substance" (Teilhard de Chardin, 1959/2002, 1959/2004). In his 1943 work, *Some Words about the Noosphere*, Vernadsky noted that the term *noosphere* was co-developed and introduced in 1927 by Bergsonian philosopher [Edouard] Le Roy and Teilhard de Chardin (Vernadsky, 1943/2005).

[93] I have experienced this first hand in relation to some exponents of all three approaches.

[94] To my knowledge, feminist theologian and Teilhard de Chardin scholar, Ursula King (2005) coined the term "noospheric diversity."

[95] My own narrative that weaves the other three together is the fourth strand.

> In evolution in general, and human evolution in particular, we are tracing *four different strands* . . . the interior and the exterior of the individual and the social, or the inside and the outside of the micro and the macro.[96] (Wilber, 2000d, p. 125)

Without wanting to become too literal about the number *four*—whether in relation to dimensions, aspects or quadrants—I feel that there is untapped academic value in honoring Gebser's approach to integrality by way of *enacting* the different structures of consciousness that can be enfolded by it. I have chosen to privilege Gebser's theoretical framework over the other two, firstly because he has specialized in cultural philosophy and history, and secondly as a check against my own potential bias towards Steiner or Wilber. The five structures of consciousness that Gebser (1949/1985) identified are differentiated by "differing degrees or intensity of awareness." Gebser (1949/1985) briefly summarized them as follows:

- *Archaic* –It is antecedent to any awareness of time and space and prior to magic consciousness, and inhabits a zero-dimensional world. It is spiritually embedded in nature;
- *Magic* – It corresponds to deep sleep, does not know of time and space, and has its domain in a one-dimensional world. It is vegetative, instinctual and vitalistic in nature;
- *Mythical* –It corresponds to dream states, knows time but not space, and inhabits a two-dimensional world. It is psychic in nature;
- *Mental* – It corresponds to wakefulness, to life in time and space in a three-dimensional world. It is essentially rational in nature;
- *Integral* – It corresponds to aperspectival consciousness, comprising a world of four-dimensions (p. 84). It is essentially spiritual in nature. Elsewhere (Gebser, 1949/1985) notes "This space-time freedom . . . is spiritual; and in this sense the fourth dimension in all its plenitude is the initial expression of a concretion of the spiritual" (p. 387).

A central claim of Gebser is that in order to effect integrality it is necessary to first be able to identify, understand and experience each of the earlier structures. For him, the luminescence of integrality comes from the ability to experience these in full awareness simultaneously—he calls this *concretion* of structures and he writes with this intent.

Several years ago, educationist and Gebser scholar, Bernie Neville, coined the phrase *writing the diaphainon*,[97] pointing to the need to develop new forms of academic writing that enacted integrality (Neville, 2000). I propose that dialogic[98] writing, intertextuality, layering, multivocality are some of the ways forward for enacting integrality in academic writing. Many of these styles are utilized in poststructuralist writing (Deleuze & Conley, 1992; Derrida, 2001; Hampson, 2007; Kristeva, 1982; MacLure, 2006a, 2006b) and formerly by Nietzsche (Del Caro & Pippin, 1887/2006). The journal *Integral Review* is contributing significantly to this project by including extended works, in which the multifocality of a main piece with several appendices can enable a rich hermeneutic circling of understanding (Roy, 2006a). This facilitated the recent article by Gary Hampson (2007), which emphasized the intimate dialogue between content and style through *nanotextology*. Within integral theory Roland Benedikter (2005) has also made a significant beginning with dialogic academic writing. I have also enacted multivocality through my interwoven tapestry of narratives.

---

[96] Wilber's four quadrants as summarized briefly by him here, bears a remarkable similarity to the *Four Fields of Knowledge* put forward by Ernst Friedrich Schumacher in his 1977 *Guide for the Perplexed*, summarized as 1. I – inner; 2. The world (you) – inner; 3. I – outer; 4. The world (you) – outer. (Schumacher, 1977, p. 62) Although Wilber refers to this book in his reference list at the end of SES, and in two endnotes, he does not cite Schumacher in relation to his four quadrants. (Wilber, 2000d) Some clarification from Wilber on this issue would be valuable.

[97] The *Diaphainon* is one of Gebser's terms for the transparency of spirit that can arise when integrality is enacted

[98] Any reference to dialogue in integral theory must take account of the seminal work on *deep dialogue* of philosopher, Ashok Gangadean (1998).

It is my intention in terms of overall style to strike a balance between organized structure and creative flow; between repetition and difference (Deleuze, 1994); and between breadth of overview and depth of gap-dives (Roy, 2006b). I will also be using an abundance of textual quotations, firstly because my primary methodology is hermeneutics, and secondly, because I value the versatility of language, the uniqueness of each individual's expression—its flavors and textures, its structure, rhythm and artistry. Specifically, I will introduce each major section with one quote from each of Steiner, Gebser and Wilber, which encapsulates something of their sense of the type of consciousness being discussed in each section. In the main narrative I will be enacting a narrative writing style that deliberately weaves conceptual reasoning with imagination, though from a *post*-rational *mythopoetic*[99] rather than a *pre*-rational mythic stance.

A Tapestry of Narratives—Terminological Threads in the Weave

> Human art, myths, and philosophies are obvious testimonies to the simple truth that we humans have always been fascinated (if not obsessed) by questions about ourselves. Our myths narrate the stories of how and why we got here, while our philosophies define and analyze what makes us human. (Isenberg & Thursby, 1984-6, p. 2)
>
> The human race seems inexorably drawn toward situating itself within cosmic narratives. (Poletti, 2003, p. 395)

The macrohistorical and macrocosmic scales that are required to research the evolution of consciousness provide significant challenges to the formal research methods of the empirical sciences. This realization is arising from within science itself. Emergentist biologist, Stuart Kauffman, (cited in Kiblinger, 2007) notes that the change in scientific emphasis from the *universal* laws of physics to the open, *contingent* possibilities of the new sciences shifts the methodological interest to stories. "Biologists tell stories. If I am right, if the biosphere is getting on with it, muddling along, exapting,[100] creating, and destroying ways of making a living, then there is a need to tell stories" (p. 196). Delving into ancient paleo-history requires, even of science itself, the narratival piecing together of fragments of fossil evidence and cohering it with

---

[99] *Mythopoetic* infers a meta-reflection on existing myths including exegesis and re-creation.

[100] *Exaptation* refers in evolution to the cooptation of traits previously adapted for other uses or conditions. Another term that has been used for this characteristic is *bricolage* (Bocchi & Ceruti, 2002).

sensible imagination.[101] In considering periods *prior* to fossil evidence the boundaries begin to blur between science, ancient mythology and such fascinating macrohistorical narratives, as I will be presenting here. In this context direct empiricism is inapplicable in isolation, whereas new methods can be developed incorporating imagination, deep intuitive insight and creative storying *in addition to* observation and understanding informed by scientific epistemologies. Goethe foreshadowed this two centuries ago with his *delicate empiricism* that infused both his scientific and his literary work (Holdrege, 2005; Robbins, 2006).

Before beginning the journey of exploration of these three fascinating narratives, I will contextualize key terms used in the title.

Macrohistorical

The term *history* is problematic in relation to human evolution, because *formal* history refers only to post-literate societies and because, as Foucault and others have demonstrated, an undeconstructed history hides implicit power relations in its explicit narratives (Foucault, 1970/1994). Over the last few decades the tensions between biology-based evolutionists and others taking broader historical, anthropological, philosophical or spiritual views, has paralleled the emergence of transdisciplinary fields, such as cultural studies, futures studies and more recently, integral studies. The concept of *macrohistory* has emerged from futures studies and includes the philosophy of history, macrosociology, geopolitics, cultural studies, international relations, social and cultural anthropology, and spiritual evolution (Galtung & Inayatullah, 1998). It is a term that generously allows for creative, visionary thinking about the past and future while providing a flexible structure from which to view the resultant perspectives. (For a discussion of conceptualizations of history through time, and of time through macrohistory, see Appendix A)

Planetary

The use of the term *planetary* has been increasing within evolution of consciousness discourses. The semiotic pluralism of its contemporary usage provides a counterbalance to the more politico-economic term: globalization. The major threads include the gradual formalization throughout last century of several layers or spheres of planetary concern to human research: *geosphere*—the physical body of the planet; *biosphere*[102]—the ecological concern for the life system of the whole planet; *noosphere*—in relation to integral planetary consciousness; and *cosmosphere*[103]—in relation to broader understanding of the place of the earth in the cosmos. Many contemporary discourses using the term planetary have been inspired by Teilhard de

---

[101] My intention with this dialectical term is to ground imagination in the phenomenology of the senses, in the Husserlian sense of *sensible intuition*, in combination with the everyday use of sensible as implying a wisdom dimension.

[102] In Vladimir Vernadsky's theory of how the Earth developed, the noosphere is the third in a succession of phases, after the geosphere (inanimate matter), and the biosphere (biological life)—the latter term he attributed, correctly, to Eduard Suess in his (1885) book *The Face of the Earth*.

[103] The term *cosmosphere* has been largely appropriated by the physical science of cosmology, and other terms which are more inclusive of the possibility of spiritual dimensions to the cosmos are only beginning to be explored. (For more information see Appendix B.)

Chardin's research on the noosphere and his notion of the "planetization of mankind" (Teilhard de Chardin, 1959/2004). (For further discussion on these themes, see Appendix B)

Tapestry

Why tapestry? Tapestry is a complex, subtly three-dimensional, weaving system traditionally combining a horizontal warp with a weaving weft that is built up vertically enabling rich imagery to emerge through the relationships between the colors. I am picturing the horizontal warp as my endeavors to adequately integrate a spatial perspective—reflecting the span of integration (as discussed above and in more detail in Appendix B). The creative weft enables me to vertically integrate the three narratives through the temporal journey. The narratives of Steiner, Wilber and Gebser provide the colorful image-patterns that are interwoven in the bigger *yarn* of my narrative. Tapestry appears to have reached an artistic peak with the famous *Hunt of the Unicorn* tapestries[104] created in France/Brussels in the early 1500s. This time was a crucial turning point in Europe when the last vestiges of mythic-picture consciousness were about to be rationalized away as superstition (Gebser, 1949/1985, p. 21). My interest is in weaving a tapestry[105] of ideas, a *noospheric* tapestry that provides a rich, colorful, evolutionary picture where both *universal* themes and *particularities* can be clearly perceived without disabling further conceptual movement and growth.

Integral

> Socially engaged contemplation [for example, dialog and knowledge building practices] forcefully brings in the ethical dimension, which one risks leaving as remote in strictly private contemplative practices. (Murray, 2006, p. 263)

My interest in writing this composite narrative is one of *integration* of integral theoretic narratives,[106] whereby, in addition to their unique particularities, the potential convergences between Steiner's integrative spiritual-science, Gebser's integral-aperspectival cultural phenomenology, and Wilber's integral-AQAL[107] theoretic framework, will emerge. These convergences point to a rising *universal field* of integrality beyond the bounds of any one interpretive framework, yet open to individual interpretation. This is not to ignore the contentions between them or smooth over the gaps and wrinkles, but to see in them the possibility for new understanding to be advanced and new meaning to emerge. Perhaps the differences, gaps and wrinkles are Deleuzian folds—holding within them secrets yet to be revealed, new "lines of flight" for the human family (Deleuze & Conley, 1992). My hope for this century and beyond is that all manner of integral theories and post-theories will flourish as part of integrality's own awakening. From my assessment—to be discussed in more detail at the conclusion of this paper—Gebser's writing is the most successful in *enacting* integrality. I have endeavored to echo this style of integrality through enacting the resounding of magic vitality, the circling of mythical imagination, the purposefulness and direction of mental/theoretical concepts, and the clarity of integral concretion of multiple perspectives, to encourage the originary presence to shine through. In this way the intent of my own integrality is not so much in detailing and mapping integral concepts—which Wilber has done so extensively—rather to *enliven* them. I hope to nurture and transpare the living imaginations of the *Zeitgeist* shining through the concepts of integral awakening in our time.

---

[104] Perhaps these tapestries—of the hunting and capturing of a unicorn—symbolize the overshadowing of mythic and magical consciousness structures in Europe, to be followed by the European Enlightenment. Yet, the mythical unicorn was not actually killed but merely captured and caged. The honoring given to the story in such a grand artistic project may foreshadow the potential re-integration of magic and mythical consciousness within integral consciousness.

[105] In addition, I must honor the previous use of the term "planetary tapestries" by Frank Poletti (2003).

[106] My privileging of the term *integral* over other possible terms such as *holistic*, or *integrative*, is in no way intended to contribute to any "turf wars." I have done this primarily to honour the substantial academic and spiritual grounding given to the term *integral* last century by Gebser and Sri Aurobindo, whose contributions are different in emphasis but entirely consistent with each other. If the notion of integral is able to retain both the scholarship and the spiritual depth of their contributions, integral consciousness will be on safe ground to flourish this century. Furthermore, by using the phrase *integration of integral views* in this paper, clearly I am not referring to any *one* particular integral theory. I also intend for *my* notion of integrality to conceptually include the notion of *holistic*, at least as it used by numerous holistic theorists who honour a developmental and evolutionary perspective.

[107] Although I have not categorized my work explicitly according to Wilber's AQAL framework (Wilber, 2004), the components of this model are implicitly included throughout, though contextualized within the

Now Time.

Fascinating Narratives

> Since evidence can be adduced and interpreted to corroborate a virtually limitless array of worldviews, the human challenge is to engage that world view or set of perspectives which brings forth the most valuable, life-enhancing consequences. (Tarnas, 1991, p. 406)

The narrative I have constructed in this paper attempts what Tarnas suggests. The term *fascinating*, particularly in combination with *narrative*, allows for the visionary and inspirational aspects of Steiner's, Gebser's and Wilber's ideas to come through. I believe that there is something in the way that their narratives are not held within the orthodoxies of one discipline that makes them so fascinating, so "irresistibly charming or attractive" so inclined to "delight" and "spell-bind"[108] us, that is, if we are able to receive them with a consciousness that is open to crossing the boundaries between disciplines. And this is what is required for the new, integral consciousness to emerge.

One of the major challenges confronted by Steiner, Gebser and Wilber is that each in his own way has attempted to elucidate an emergent movement of consciousness that is not yet well-

---

larger narrative. 1) *Quadrants* are referred to re integral hermeneutic methodology; 2) clearly Wilber's *developmental waves* are addressed; 3) a number of *lines* or *streams* are included, such as cognitive, imaginative, spiritual, linguistic and aesthetic, to name a few; 4) the major *states* of deep sleep, dreaming and waking are inherent in the magic, mythic and mental structures of consciousness—as noted earlier; and 5) the notion of *types* is addressed by my overall project which weaves together different *types of integral theoretic narratives*. Finally, my use of *theoretic bricolage* is a type of *methodological pluralism*, which draws in some way on all the various methods Wilber lists in his *eight native perspectives* (Wilber, 2006).

[108] These phrases in inverted commas are selected from a range of dictionary meanings for the term, *fascinating*.

established within mainstream academic discourse. All three use a combination of language and terminology that may be found in a range of disciplines, especially cultural-anthropological, philosophical, psychological, scientific and spiritual/religious. They are telling planetary tales that interweave to varying degrees: art, linguistics, literature, macrohistory, paleontology, philosophy, psychology, science and spirituality. Yet in their endeavors to integrate contributions from the individual disciplines, they are likely to fall prey to attack from within each discipline as not fully embracing their orthodoxies. So rather than referring to their contributions as scientific research, philosophical deduction or spiritual insight, although they include elements of these, I am choosing the term *narrative* for its potential inclusiveness. This also honors the emergence of narrative theory in social science research over the past decade (de Beer, 2003; Denzin & Lincoln, 2005; Heikkinen, Huttunen, & Kakkori, 2000) within the broader context of the *narrative turn*—which followed the *linguistic turn*—within the Academy as a whole (Montuori, 1999). Paradoxically, the narrative turn has co-arisen in parallel with Lyotard's (2004) identification of the "de-legitimation of the grand narratives" of modernity. The constructive nature of his perspective is indicated in the following words:

> Most people have lost the nostalgia for the lost narrative. It in no way follows that they are reduced to barbarity. What saves them from it is their knowledge that legitimation can only spring from their own linguistic practice and communicational interaction. Science 'smiling into its beard' at every other belief has taught them the harsh austerity of realism. (p. 41)

This freedom from the hegemony of scientific and ideological *grand narratives* has created a space, a "productive void"[109] from which a plurality of creative, new—perhaps more *humble*—narratives, can arise. In their book, *The Narrative Universe*, "what Ceruti and Bocchi call for is the complex engagement with a multitude of mininarratives" (Poletti, 2003, p. 398). My tapestry of narratives is an artistic engagement with this perspective. Frank Poletti, Ceruti's translator, summarizing some other work of Ceruti, refers to his notion of Unitas Multiplex[110] for "unity-in-diversity and diversity-in-unity" (F. Poletti, 2005, p. 290).

This is a contemporary postmodern echo of Whitehead's call a century ago for the production of "a diversity of metaphysical schemes" (Gare, 2002, p. 49). In a comprehensive study of the genealogy of both poststructuralism and process philosophy via Schelling, Gare cites Whitehead: "we cannot produce that final adjustment of well-defined generalities which constitute a complete metaphysics . . . we can produce a variety of partial systems of limited generality" (Gare, 2002, p. 49). Gare continues:

> The resulting rival schemes, inconsistent with each other but each with its own merits and its own failures, will then warn us of the limitations within which our intuitions are hedged. This simultaneously opposes the quest for absolute truth while allowing that understanding can be advance. (p. 49)

---

[109] Roland Benedikter uses this term to describe the space created by postmodern philosophers, such as Foucault, Derrida, when they go beyond deconstruction to find the "productive void" (Benedikter, 2005).

[110] The term *Unitas Multiplex* has been popularized in Europe by Morin (2001a).

The three narratives I am interweaving could be seen as somewhat *rival* metaphysical[111] schemes in the sense described by Whitehead. From the perspective of some of their followers, there is certainly a competitive element and in some respects an exclusive, rather than inclusive, sensibility. My multifocal process unravels the individual narratives, discarding unviable threads, while simultaneously re-weaving my own composite narrative tapestry to bring a fresh luminescence to the evolution of consciousness discourse.

An Encircling of Appendices

A brief summary of the three appendices now follows.

Appendix A: From Time to Time: Retro-Meta-Reflections on Time(s)

> Time . . . is a much more complex phenomenon than the mere instrumentality or accidence of chronological time. (Gebser, 1949/1985, p. 285)

My cognizance of the complexity of the discourses on time—cultural, scientific, philosophical, feminist, historical, theological— in-*tim*-idates me. Yet, inspired by the criticality of our present planetary moment *in time*, I feel beckoned into developing a tentative temporal template [112] for my evolution of consciousness research. This appendix contextualizes and discusses the default view of time—the three-phase linear-time model of past, present and future that underlies modernist models of *development*, *evolution* and *progress*. It is contrasted with alternative views of time based on Gebser's temporics, which is used to explore Steiner's, Wilber's and other views of time. Gebser's notion of *concretion of time* as being central to integral consciousness is also highlighted. (For more detail see Appendix A).

Appendix B: Cosmic Kinship: A Micro-Macro View of Space

> The overemphasis on space and spatiality that increases with every century since 1500 is at once the greatness as well as the weakness of perspectival man. (Gebser, 1949/1985, p. 22)

As far as we know, or can determine at this point in our global knowledge capabilities, the earth is the only-born child of her kind in the cosmos. In spite of our common biological ancestry with other mammals,[113] we humans appear to be the most biologically suitable species to play an active role in earth's nurturing care. Yet the imbalance that has arisen from the over-extension of the deficient egoistic aspects of mental-rational consciousness has led to the polar opposite of care for our only planetary home. There is a growing complexity and urgency of planetary issues from socio-cultural, politico-economic and environmental perspectives—such as a growing youth mental health problems, increasingly inequitable wealth distribution, climate change, mass extinction of species and water shortages. These require more than piece-meal, fragmented *solutions,* and demand a reframing of human relationships with nature and the cosmos. This appendix engages the notion of space in a multidimensional—but not technicist—manner, including: a re-examination of terms such as cosmology, cosmogony, cosmosophy, cosmography and cosmopolitanism; the metaphoric terrestrialization of the cosmos; consideration of the emergence of planetary conceptions of space in the 15th century; the plight of indigenous people; and noospheric space. (For more detail see Appendix B).

---

[111] One needs to bear in mind that the term *metaphysical* has multiple meanings and it is beyond the scope of this paper to enter into such a terminological discussion. However, based on Wilber's interpretation of Habermas, Wilber describes himself as 'post-metaphysical' (Habermas, 1992; Wilber, 2001c).

[112] My usage of template refers at least to its etymological roots from the Latin: *templum* "piece of ground consecrated for the taking of auspices, building for worship," and from the French *templet* "weaver's stretcher," the latter, in relation to my planetary tapestry. http://www.etymonline.com/index.php?search=template&searchmode=none

[113] It is noteworthy that our brains are second only in complexity to dolphins (Russell, 2000).

Appendix C: Literacy Unveiled: Art as Language from a Palaeoaesthetic Perspective

> It took centuries to sufficiently devitalize and demythologize the word so that it was able to express distinct concepts freed from the wealth of imagery, as well as to reach the rationalistic extreme where the word, once a power and later an image, was degraded to a mere formula. (Gebser, 1949/1985, p. 83)

The evolution of human consciousness is intimately interwoven with the development of speech, language and in the last few millennia, increasingly more abstract forms of writing. A brief pictorial essay of this development is interspersed with contextualizing conceptual comment. The piece will, I hope, inspire a new understanding of the earliest forms of aesthetic sensibility expressed by humans and even *pre*-humans. The images may provide an aesthetic balance to my own cognicentric bias at times. Although originally intended to also continue the presentation through the aesthetic dimensions of mental and integral modes of consciousness, this proved too large a project for an appendix in an already lengthy article. The piece has been bounded at the end of what we are calling the mythic period, prior to the ego-mental emergence around 800 BCE. The remainder will be pursued as further research. (For more detail see Appendix C).

3. The Emergence of the Dawn Human

> That original wisdom was an actually inspired wisdom, one that came to man from without, arising from divine worlds. (Steiner, 1971a, p. 114)

> Dreamlessly the true men of earlier times slept. Chaung-tzu ca. 350 BCE. (cited in Gebser, 1949/1985, p. 44)

> In the uroboric state, man "swims about in his instincts like an animal. Enfolded and upborne by great Mother Nature, rocked in her arms, he is delivered over to her for good or ill." (Wilber, 1996c, p. 31)

Context for Emergence of Dawn Humans

Scientific data and interpretation of it regarding the emergence of human beings on earth is fragmentary, somewhat incoherent, and still being uncovered.[114] To add to the challenge of transdisciplinary research in this area, there appears to be different nomenclature and time-lines to classify the various geological and archaeological periods both between and within disciplines Scientific convention currently places the emergence of the *Homo* species within the Pliocene geological epoch (c. 5-1.8 million years BP[115]) and continuing throughout the Pleistocene epoch that is referred to as the *Great Ice Age*[116] (c. 1.8 million 10,000 BP) (Lock & Peters, 1999). The Pleistocene—or *Great* Ice Age—also contains within it colder and warmer cycles called glacial and interglacial,[117] respectively. A potential confusion is that the most recent *glacial* period (c. 70,000-10,000 BP) is often also referred to in common parlance as *the Ice Age*. It was preceded by a warm, humid, *interglacial* period (c. 130,000-70,000 BP) (Ambrose, 1998). Within the macro-geological period—*the Great Ice Age*—there are also two archeological periods: the Lower Paleolithic (2.5 million to 180,000 BP) and the Middle Paleolithic (180,000-30,000 BP) (Bednarik, 2007). (For chronology of Palaeolithic periods, see Table C1 in Appendix C).

---

[114] There are many complex scientific issues re accurately dating events of the past. Radiocarbon dating is only accurate back to c. 60,000 years BP Also "Fossils older than ~100,000 years do not yield measurable DNA samples, thus do not currently bring order to the confusion of bones and stones among the hominins dating back millions of years."
http://www.tufts.edu/as/wright_center/cosmic_evolution/docs/fr_1/fr_1_cult1.html

[115] 'BP' in geological terms refers to *Before Present* (which actually means before 1950).

[116] Although the theory of the Great Ice Age was formalized by Swiss paleontologist Louis Agassiz in 1837, the term *Eiszeit* or Ice Age, had already been coined by Goethe in his novel *Wilhelm Meister* in 1823 (Cameron, 1965). Goethe's contribution to the nomenclature has been endorsed by *The Subcommission on Quaternary Stratigraphy* (SQS), International Union of Geological Sciences (IUGS). http://www.quaternary.stratigraphy.org.uk/about/history.html

[117] For at least the last million years the glacial/interglacial periods have followed fluctuating cycles related to the astronomical phenomenon called the *precession of the equinoxes*, now recognized as contributing to geologically abrupt climate change (Varadi, Runnegar, & Ghil, 2003). http://www.ncdc.noaa.gov/paleo/abrupt/story2.html For discussion of the potential influence of these cycles on culture and consciousness see Appendix A.

The biological lineage and nomenclature of early species within the *Homo* genus is also academically contested, with almost every source using a slightly different taxonomy and/or chronology. It is beyond the scope of this article to fully articulate this debate except by brief pointers. The early *Homo* species, *H. Habilis* and *H. Rudolfensis*, according to fossil records, first inhabited Africa in the Pliocene epoch, a little over 2 million years ago (Lock & Peters, 1999). However, the *Homo* status of these early *hominins*, is currently under revision (Key, 2000; Wood & Collard, 1999). The middle *Homo* period included *H. Ergaster/Erectus*—who emerged in both Africa and Eurasia, during the Plio-Pleistocene transition (2 million to 200,000 BP) (Key, 2000; Lock & Peters, 1999; Wood & Collard, 1999). The group of species now generally referred to as *Archaic* Homo species (Key, 2000), include the well-known *H. Neanderthalensis* from western Eurasia (250,000-30,000 BP) and *H. Heidelbergensis* identified in Africa and Eurasia (500,000-100,000 BP) (Key, 2000; Lock & Peters,1999; Wood & Collard, 1999). Archaeological convention currently dates the first appearance of *H. Sapiens*—also referred to as *anatomically modern human*—to approximately 100,000 BP (Key, 2000), though it is often placed earlier.

The timing of the development, evolution and characteristics of the origins of human nature and consciousness is also a highly academically contested area. My interest here is not in debating issues of taxonomy or detailed chronology as these are appropriate areas for disciplinary specialization. Rather my interest is in the bigger picture transdisciplinary context that this data informs, particularly the assumptions about the nature and consciousness of early humans. For a discussion on the two major theories regarding human origins: the *short-range* (or *cultural explosion* theories) and the *long-range* (or gradualist theories) see Appendix C. With regard to the capabilities of Homo Ergaster/Erectus the views range from archaeologists who claim that they were little more than apes, to rock art scientists who claim that they were already sea-faring at 800,000 BP (Bednarik, 2003a). The use of fire by H. Ergaster/Erectus is generally accepted from at least one million years ago (Sedikedes, Skowronski, & Dunbar, 2006) and may go back to 1.42 million years ago (Watson, 2005, p. 26). Watson claimed that about a million years ago H. Ergaster/erectus spread out over much of Eurasia (i.e., not the northern latitudes, Australia or the Americas). This may add circumstantial support to Bednarik's sea-faring claims. The second major cranial expansion occurred around 500,000-300,000 BP with the new species *H. Heidelbergensis* being referred to as the *archaic Homo Sapiens* from which both the Neanderthal and the anatomically modern human emerged (Hodgson, 2000; Mithen, 2007).

There are challenges in unraveling the links between the academic context and the earliest consciousness referred to in our three narratives particularly with regard to early chronology. Wilber's—with his access to contemporary taxonomies—is the easiest to place. His narrative begins with the pre-homo, hominin species dating from five or six million years to 200,000 years BP. Steiner's somewhat contradictory statements about chronology need to be contextualized within the early 20th scientific notion of the earth as being only about 100 million years old. (See Appendix A for more details.) Steiner refers to the first period of *human* consciousness in many of his lectures as having a duration of millions of years. It appears most likely that both Wilber and Steiner are referring to the early and middle *Homo* species during the Plio-Pleistocene glacial epochs—up to, and including, Lower Palaeolithic *archaic humans* prior to the emergence of anatomically modern humans. Gebser refuses to enter into what he calls *mental mode* linear, temporal placement of archaic consciousness, though his choice of the term *archaic* may not be coincidental (Gebser, 1949/1985, p. 61).

Terminology Issues

A divergence between the three narratives is their terminology for identifying these earliest humans and their consciousness. Steiner's rather anachronistic terminology for this first type of human is *Lemurian*, which in his day was a conventional scientific term.[118] As mentioned, Gebser used the term *archaic*, because of its Greek roots in *arche*, meaning inception or origin, from which Gebser focuses on *origin*.[119] Wilber uses the hybrid term *archaic-uroboric*, to combine an honouring of Gebser's usage with his own research: "*Uroboros*[120] is the primordial mythic symbol of the serpent eating its own tail, and signifies self-possessed, all-enclosing but narcissistic, "paradisical" but reptilian (or embedded in lower life forms)" (Wilber, 1996c, p. 26).

Unlike most scientific endeavors that study the human as an *object*, Steiner, Gebser and Wilber have each written narratives of the evolution of human consciousness, from the *inside*—the *subjective* side. Wilber asks: "What might Dawn [Human] have experienced, before [she] developed language,[121] higher-order emotions, and self-consciousness?" (Wilber, 1996c, p. 33). Gebser (1949/1985) uses *cryptic koans* from Chinese sages of the late mythic era—see above quote—claiming they are more illuminating of archaic consciousness than our contemporary "retrospective conclusions and prognostications" (p. 45). Steiner (1904/1959) in reference to the subsequent stage—has this to say: "The aim here is to record some details concerning their spiritual character and the inner nature of the conditions under which they lived" (p. 41).

Key Features of *Archaic* Consciousness

Several features have been identified in the narratives—or associated literature—and will be briefly explored through the text:

---

[118] In Steiner's time the word *Lemuria* had a scientific meaning as it was coined by geologist Philip Sclater who theorised a lost continent related to the presence of fossil *lemurs* in both Madagascar and India, but not in Africa or the Middle East. The term was used by biologist, Ernst Haeckel, and also by theosophists. While Steiner initially collaborated with Ernst Haeckel and theosophists he later clearly distanced his epistemology from both (Steiner, 1925/1928, pp. 338-339).

[119] *Archaic* is also used in several other ways: In paleoanthropology it is used to refer to early Homo species such as *H. Heidelbergensis* and *H. Neanderthalensis* in alignment with Gebser (Key, 2000). In American pre-history it is used to describe the period from 8,000-1,000BCE; and is also used in art history. http://encarta.msn.com/encyclopedia_761566394_9/Human_Evolution.html

[120] It appears that Wilber may be taking an overly biological interpretation of this symbol compared to the intention of Erich Neumann whose work he cites. Neumann (1954/1995) himself has much to say about the *Uroboros* symbol, including the following: "As the Heavenly Serpent, the uroboros was known in ancient Babylon . . . and also the Primal Being that says: I am Alpha and Omega . . . the most ancient deity of the prehistoric world" (p. 10).

[121] It should be noted that humans are not the only species who have developed higher-order emotions, complex language and some degree of self-consciousness. It is outside the scope of this paper to explore this in detail however (Hampson, 2005; Lilly, 1967; Russell, 2006).

- Embeddedness in nature and the cosmos.
- Biologically primitive or spiritually wise?
- Matriarchal culture.
- Sense of Eden/Paradise.
- Palaeoaesthetic sensibility and expression. (This is detailed in Appendix C).

Embeddedness in Nature and the Cosmos

I will set the scene with Wilber's characterization of Archaic-Uroboric. Drawing on a range of anthropological sources, he summarizes it thus:

> The uroboros represents a primal, undifferentiated, dreamy autistic state in which man did not know himself as separate, and did not have self-conscious life. (Wilber, 1996c, p. 29)

While Wilber emphasizes the embeddedness in nature at this stage, Gebser and Steiner also emphasize embeddedness in the cosmos. Although Gebser (1949/1985) does not go into detail in cosmogenic terms, he claims that the primary relationship for archaic human was with the "'universal or [cosmic]" (Synoptic table). Steiner's cosmogony is extensive but beyond the scope of this paper to cover in any detail. A distinguishing feature of Steiner's dialectical insights is that his notion of human is *spiritual* in origin—and thus not solely dependent on the *Homo* or even hominin *biological* form. He sees early life forms as part of the struggle of the originary soul-spiritual human being to take physical form on earth (Poppelbaum, 1970; Thompson, 1998).[122] Gebser and Wilber make similar claims that the physical world unfolds from the spiritual, though neither discuss this area in as much detail as Steiner. There are several integral theorists who have proposed a dialectic between biological *evolution* and spiritual *involution*[123] (Aurobindo, 2000; Combs, 2002; Davidson, 1992; Gebser, 1970/2005; Hocks (2006); Murphy, 1992; Steiner, 1971c; Wilber, 2001b). Even though Steiner, Gebser and Wilber share the involutionary view of evolution, there are subtle divergences as the next sub-section demonstrates.

Biologically Primitive, or Spiritually Wise?

Georg Feuerstein, key interpreter, and translator of Gebser's work in the USA, identifies a significant divergence between Wilber's and Gebser's views in one important area. Feuerstein (1997) notes Gebser's position on archaic consciousness as being "closest to and presumably originally identical with Origin" while Wilber's position is that "the archaic structure is closest not to Origin but to the great apes and [hominins]" (p. 34). While space does not allow a full participation in the ensuing discussion between Wilber and Feuerstein, my interpretation is that the problem arises from a polarized perspective between biological and spiritual evolution. In regard to the earliest humans, Gebser emphasized spiritual evolution whereas Wilber focused on the biological primitiveness.

---

[122] This is notwithstanding the notion that numerous species diverged from this hominin line at various earlier points in time.

[123] The notion of involution could be conceptually linked with the concept of *implicate order* developed from the 1960s by theoretical physicist David Bohm drawing on quantum physics and Alfred North Whitehead's process philosophy (Bohm, 1980; Bohm & Edwards, 1991). Bohm's notion of implicate order has also been conceptually linked to biologist Sheldrake's (2006) *morphic field* theory and more recently with systems scientist Laszslo's Akashic—or information—field theory (Combs, Arcari, & Krippner, 2006; László, 2007). Further research on this topic is in process (Gidley, 2007c).

> The archaic-uroboric period . . . presents in a very global fashion the great transition from mammals in general to man in particular, and stands further as the great subconscious ground out of which the figure of the ego would eventually emerge. . . . (Wilber, 1996c, p. 33)

Steiner dealt with this paradox dialectically by presenting information from both perspectives. In some of his writing he spoke in reference to the dominance of biology in terms of "passionate impulses" in a similar vein to Wilber's reference to their embeddedness in, and domination by, the "lower levels themselves." His biological knowledge was quite extensive. Some of his descriptions of the proto-humans[124] prior to anatomically modern humans suggest biological knowledge similar to that expressed in recent reconstructions of *H. Ergaster/Erectus,* by evolutionary psychologists—"a shift of energy from the gut to the brain" (Sedikedes, Skowronski, & Dunbar, 2006, p. 59). The other pole of the dialectic is that—like Gebser—Steiner (1971a) drew attention to the original wisdom of these early humans.

> That *original wisdom* was an actually inspired wisdom, one that came to man from without, arising from divine worlds [italics added] (p. 114).

Wilber (1996c) is apparently also aware of this paradox, using the term "ground unconscious" to distinguish this period from a fully unfolded future "superconsciousness" (p. 34-35). This paradox will continue to recur as our narrative proceeds and becomes increasingly illuminated—as Gebser might say—the more *transparency* we bring to the issues. My research seeks to throw light on this issue through exploring the art of the Lower and Middle Palaeolithic period. (See Appendix C).

Matriarchal Culture

Another convergence between the three narratives is that all three consider the archaic, and subsequent period to be strongly influenced by female archetypes. As Wilber (1996c) states—citing Campbell—the Great Mother "has shown herself at the very dawn of the first days of our own species" (p. 129). This is consistent with other cultural mythological research on the significance of the female archetype as primordial Goddess—represented in Paleolithic art as the Venus figurines; and the Great Mother archetype in Neolithic and Egyptian mythology (Eisler, 1987; Neumann, 1954/1995). Gebser (1949/1985) claims that the matriarchy did not really break down until around 500 BCE with the entrenchment of patriarchy in Greece. Steiner claimed that these early matriarchs assisted the development of early language, and even memory, through initiating rhythmical chanting, and interpreting the hidden language of nature—which they expressed in *sound, tone and rhythm*. This is supported by recent research into the origins of music and language (Dissanayake, 2005; Merker, 2001; Mithen, 2007; Skoyles, 2000; Wallin, Merker, & Brown, 2001). Human language is believed to have developed very slowly—with few sounds, mostly consonantal and gradually in combination with vowels—for about half a million years during the Paleolithic period, until the Upper Paleolithic around 35,000 years ago (Lock & Peters, 1999, p. 771-772). (See also Appendix C).

---

[124] "The shape of the head and forehead was quite different; the forehead was much lower and the digestive organs were much more powerful" (Steiner, 1986a, p. 65).

Sense of Eden/Paradise

In spite of some differences in temporal orientation and detail, the narratives of Steiner, Gebser and Wilber converge in many respects on their overall sense of this archaic structure of consciousness. Gebser stresses the pre-temporal and pre-spatial nature of their consciousness. Steiner (1978b) claimed that this period was what in the bible was called "Paradise" (p. 90). Gebser's (1949/1985) representation of this period is very similar:

> It is akin, if not identical, to the original state of biblical paradise: a time where the soul is yet dormant, a time of complete non-differentiation of [human] and universe. (p. 43)

Wilber (1996c) citing Gowan's (1975) *Trance, Art and Creativity*, concurs with both Steiner's and Gebser's notion of the relationship between the dawn human and the biblical paradise, or Eden:

> *Genesis* describes this state as "Eden" and tells us that when [humans] ate of the tree of knowledge, [they lost their] innocence, and [were] cast out (into space, time, and personality). (p. 29)

The inclusion of these comments is not intended to suggest that these authors take the biblical metaphor of Eden/Paradise literally. Rather, my interpretation of their original intentions is that they are each taking a critical stand against the materialistic perspectives of most evolutionary biology and are endeavoring to present an alternative narrative for consideration. My privileging of their narratives arises from the same rationale. It is a rewriting of the evolution story at its origins.

Summary and Relevance for Today

In summary, although there is a remarkable coherence between the three narratives for this archaic beginning of human consciousness, there is also differentiation of emphasis. Gebser's interest appears to focus on grounding this early consciousness in an originary spiritual experience, with limited attention to matters of biological development—he is primarily developing a spiritually-oriented, cultural phylogeny. He does however make reference to "the parallels between the developmental stages of mankind and those of the individual, in the context of the various structures of consciousness" but does not pursue this in detail (Gebser, 1949/1985, p. 58). Wilber's interest appears to be in emphasizing the limitations of the early biological human form in enabling complex cognition, which he sees as a basis for spiritual development. He also subscribes to the notion that individual development (ontogeny) recapitulates cultural evolution (phylogeny). Steiner integrates these positions demonstrating an evolving complex dialectical relationship between the originary soul-spiritual consciousness of humans that he claimed accompanied and *in*formed biological evolution. He also described the gradual incorporation of the human spirit into material/biological form over vast time periods, as the proto-forms biologically evolved.[125] Anthropologist/ ethnographer Richard Grossinger uses the dialectical phrase *spiritual embryogenesis* for the significant work that Steiner has undertaken in this regard (Grossinger, 2000, p. 706).

The relevance for today of Gebser's notion of the originary spiritual aspects of archaic consciousness is intrinsically linked with his notion of integral consciousness, which, when awakened, enables conscious access to this original spirituality. For Gebser, the key though is *intensification* of consciousness, not *regression* to a previous state.

Transition

A major dissonance between the evolutionary biology narratives and these narratives, particularly Steiner's and Gebser's, is that the latter identify a type of spiritual wisdom in the consciousness of these early humans. An appreciation of the notion of involution as being in a dialectical relationship with evolution—which Wilber has as well—is a starting point to understand these perspectives. This is in stark contrast to the views of most biologists, including emergence theorists who claim that mind, morals—and even spirituality—emerge purely from physical/biological existence (Goodenough & Deacon, 2006).

Yet Steiner, Gebser and Wilber all agree that these archaic humans did not yet experience their own independent selves, nor did they yet have a sense of difference between earth and sky. Based on this the transition between what Gebser calls *archaic* and *magic* consciousness appears to mark the emergence of the human's earliest sense of his or her own individual self/soul. This is not inconsistent with recent evolutionary psychology research (Sedikedes, Skowronski, & Dunbar, 2006). This consideration leads the narrative into the next major period.

Before we continue our narrative we need to diverge momentarily and consider some macro-pauses in this evolutionary narrative . . .

The Punctuated Global *Dis*equilibrium[126] of Geo-Climatic Catastrophes

The extent to which human consciousness and culture have been affected by major geologic and climatic events has received little attention in the evolution of consciousness discourse, perhaps largely as a result of disciplinary isolationism. Steiner is one of the first post-Enlightenment theorists to coherently integrate phenomena such as astronomical cycles and geoclimatic changes with culture, mythology and consciousness through his evolutionary macrohistory (Scharmer, 1998). His approach foreshadowed contemporary integrative scientific and philosophical developments (Firestone, West, & Warwick-Smith, 2006; Tarnas, 2006;

---

[125] Sri Aurobindo's extensive writings on evolution also include a similar perspective to Steiner's where the spiritual dimension he calls *overmind* gradually descends into the material world (Aurobindo, 2000).

[126] The term Punctuated Equilibrium was coined by palaeontologists Niles Eldridge and Stephen Jay Gould in 1972 to represent observed discontinuities and plateaus emerging from fossil evidence and in contrast to Darwin's *gradualist* evolution theory (Eldridge & Gould, 1972). The term punctuated *dis*equilibrium has recently been used to refer to sudden catastrophic climatic or ecological events related to global warming (Angelo, 2005). I am semiotically linking these two meanings in my use of the latter term.

Ulansey, 1994). Neither Gebser nor Wilber seem aware of, or pay attention to, the impact of such geo-climatic events on culture and consciousness. However, Steiner—who predicted that science would eventually realize the validity of his insights—spoke of the significance of *two* major environmental catastrophes that marked transitions between major movements of culture and consciousness.

Steiner's narrative gains some support from the renewed interest in catastrophe theory in geology, in response to the current climatic situation and the growing awareness of the possibility of future rapid climate change (Mithen, 2004; Weart, 2003). Early 19th century theories of catastrophism and resultant extinctions were generally associated with *short* time-scales for the history of the Earth, and religious overtones—positing miraculous/divine interventions in subsequent re-population. The late 19th century saw a shift to more scientific geological theories, such as *uniformitarianism* and theories of gradual change that echoed Darwin's *gradualism* in classical biology. However, the postformal, interdisciplinary turn in science is beginning to point to underlying phenomenological connections that may have been "known" in pre-modern myths but that went unnoticed as a result of the disciplinary specialization of the modernist scientific period (Ulansey, 1991). In addition to the major scientific shifts from classical to quantum physics and from classical biology to chaos and complexity, the first half of the 20th century saw dramatic changes to scientific perceptions and theories about numerous other phenomena with potential relevance to evolution of consciousness theories:

- Radio carbon dating was discovered in 1949, enabling scientists to determine the age of materials up to 60,000 years ago;
- As a result, the scientifically theorized age of the earth, went from 100 million years to 4.5 billion years;
- The stable, static notion of continents gave way to continental drift theory in the early 20th century, followed in the 1960s by the mobile dynamic notion of plate tectonics.

In the light of some of these changes, contemporary geology theories propose that Earth's overall history is a slow, gradual story, punctuated by occasional natural catastrophic events that have affected the Earth and its inhabitants (Firestone, West, & Warwick-Smith, 2006). Contemporary interdisciplinary theories are beginning to address these issues. Recent research from evolutionary psychology[127]—including methods from geology, physics, archaeology, mythology, and anthropology—supports the "punctuated" narrative of cultural evolution proposed here (Sedikedes, Skowronski, & Dunbar, 2006, p. 58). Also leading archaeological and anthropological research appears to be moving in this direction. Archaeologist, Steven Mithen, refers to glaciations cycles, ice ages and global warming as significant events in cultural change. Anthropologist, Richard Klein, points to the significance of both the Younger Dryas event and also the Toba Volcano—which we will discuss below—as triggers for major shifts in culture and consciousness (Klein & Edgar, 2002). Such research demonstrates support and formalization of some of the insights that Steiner intuited and cohered more than a century ago. What is still needed, though, is a comprehensive transdisciplinary theoretical integration of this material focusing on potential effects on the evolution of culture and consciousness.

---

[127] A critique can be made of much evolutionary psychology in that it is uncritically endorsing the one-sided materialistic Darwinism of much evolutionary biology (Loye, 2004).

Firstly, Steiner (1904/1959) referred to a geo-climatic catastrophe that marked the end of the development we have been discussing and the beginning of the culture that followed it: "mighty volcanoes existed almost everywhere and developed a continuous destructive activity. . . . It was through the activity of this volcanic fire that the destruction of the Lemurian land came about" (p. 85). He saw this as a period when much of the population of the time was wiped out: "a great part of the land was destroyed, and only a small number of the inhabitants . . . were preserved and could continue the human race" (Steiner, 1954/1981a, p. 123). Paleoanthropologist, Stanley Ambrose (1998), proposed that the eruption of the *Toba Volcano*[128] caused the well-documented massive reduction in global population—called a bottleneck (p. 627). He concludes that "Volcanic winter may have inserted a brief Punctuated Equilibrium event (Eldredge & Gould, 1972), in the course of recent human evolutionary history, accelerating geographic differentiation (p. 644-645). Although there has been some contestation of details of his claims (Gathorne-Hardy & Harcourt-Smith, 2003), Ambrose (2003) has responded, providing further substantial evidence for his theories. Anthropologist Richard Klein has also lent support to Ambrose's theory (Klein & Edgar, 2002). More research appears to be needed.

A second abrupt and extreme climatic catastrophe occurred approximately 60,000 years after the Toba volcano. This event is known as the Younger Dryas. Very recent archaeological research indicates the Younger Dryas event was triggered by the meltwater in North America, from the last glacial period, forcing the ocean current patterns to slow or stop. This was as a result of a surge of fresh water and reduced salinity in the North Atlantic Ocean, and sent Europe into a sudden freeze, over just a few decades. (Carlson et al., 2007; Colman, 2007; Tarasov & Peltier, 2005). This new cold event lasted around 1,400 years to approximately 9,500 BCE, beginning as the Earth was coming out of its 60,000-year glacial period.

Steiner also speaks of a second major catastrophe that occurred at the end of the ice age. Steiner (1910/1939) described and theorized it as a major geo-climatic event of freezing and melting during which the sea levels rose such that "The face of the earth was totally changed in regard to the distribution of water and land" (p. 94). Steiner's insight was quite unusual for his times given that the geological convention was uniformitarianism. The Younger Dryas as a phenomenon was not discovered until 1949, and the acceptance of the notion of rapid climate change by geoscientists has only begun very recently. Physicist Spencer Weart (2003) pinpoints it to, "the day they read the 1993 report of the analysis of Greenland ice cores."

A recent scholarly book by nuclear physicist Richard Firestone, Allen West and geologist, Simon Warwick-Smith (2006), has emphasized the significance of catastrophe theory. They draw on a combination of hard science and North American indigenous mythology and oral history focusing on cosmological contributions to such events. Their evidence pointing to a comet strike corroborates with the timing of the beginning of the Younger Dryas, 13,000 years ago. Steiner (1910/1939) also pointed to the interconnections between these tellurian events and events of cosmic proportions. "Such periods and changes consequent upon them are connected with mighty processes in the constellation, position and movement of the cosmic bodies connected with the sun" (p. 94). These earth-influencing astronomical cycles are now referred to as the *Milankovitch cycles* (See Appendix A).

---

[128] In Ambrose's (1998) words "The last glacial period was preceded by one thousand years of the coldest temperatures of the Later Pleistocene (71–70 ka), apparently caused by the eruption of Toba, Sumatra. Toba was the largest known explosive eruption of the Quaternary" (p. 623).

In summary, the last glacial period—known as *the ice age* (c. 70,000-10,000 BP)—appears to have been punctuated on either side by two relatively sudden, extreme environmental events.

- The volcanic winter and subsequent 1,000 year freeze caused by the Toba supervolcano in Indonesia approximately 73,000 years BP; and
- The Younger Dryas, a dramatic 1,300-1,500 year freeze—up to 11,500 BP—as a result of the ice-melts in North America from the warming after the last major glacial period.

Notwithstanding the difficulties a century ago—and even today[129]—in accurately dating such distant events, Steiner identified dramatic geo-climatic events very similar to these, pointing to them as significant markers between the major movements of culture and consciousness we are discussing. It is however difficult to establish the veracity of his claim in relation to the earlier of these two events because he gives contradictory indications about chronology.

The next section of our narrative introduces developments in consciousness and culture—especially aesthetics—of the Ice-Age Humans and particularly their development during the period between and surrounding these punctuations (70,000-10,000 BP).

---

[129] The radiocarbon dates from *Geißenklösterle* corroborate observations from other non-archaeological data sets indicating large global fluctuations in the atmospheric concentrations of radiocarbon between 30 and 50 ka calendar years ago. These fluctuations lead to complications in building reliable chronologies during this period and cause the *Middle Paleolithic Dating Anomaly* and the *Coexistence Effect*, which tend to exaggerate the temporal overlap between Neanderthals and modern humans (Conard & Bolus, 2003).

4. Magic Connectionism: Art and Culture in a Glacial-Landscape

> Of the period we are about to enter, and with that "subjective mood" in mind, I suggest quite simply: the first men and women to appear on the earth during these times . . . were not just simple hunters and gatherers—they were magicians. (Wilber, 1996c, p. 43)

> Everything that is still slumbering in the soul is at the outset for magic [consciousness] reflected mirror-like in the outside world . . . as we experience dream events in sleep . . . In a sense one may say that in this structure of consciousness was not yet [internalized], but still resting *in the world.* (Gebser, 1949/1985, p. 46)

> In the earliest period [humans] possessed strong magical powers. With these powers [they] . . . mastered the forces of nature and in a certain way [were] able to see into the spiritual world. Clairvoyance then gradually faded. [Humans] were destined to found the culture belonging to the earth; they were to descend to the earth in the real sense. (Steiner, 1978b, p. 96)

Context for the Flourishing of Palaeoaesthetics

> 'Art' has always been associated with the early cultural 'success' of anatomically modern humans, and with the establishment of what appears to be a 'fully human' cultural pattern. (Lock & Peters, 1999, p. 289)

This decade-old conventional archaeological statement appears to be becoming outmoded by the increasing body of evidence of aesthetic development in early *Homo* species, such as *H. Heidelbergensis* and *H. Neanderthalensis* and the growing interest in palaeoart outside of Europe (as discussed in some detail in Appendix C). The last glacial age (c. 70,000-10,000 BP) was a period of great development of culture and human consciousness. This is within the late Pleistocene age and up to the beginning of the current geological epoch—the Holocene that began c. 10,000 BP. In archeological terms this includes the latter part of the Middle Paleolithic period and the entire Upper Paleolithic period. As indicated earlier the transition from the Lower to the Middle Palaeolithic periods was highly significant for human evolution with several species of the *Homo* genus co-habiting the planet—*H. Heidelbergensis* identified in Africa and Eurasia (500,000-100,000 BP), followed by *H. Neanderthalensis* from western Eurasia (250,000-30,000 BP) and *H. Sapiens* (appearing c. 100,000 BP) now frequently referred to as *anatomically modern human* (Key, 2000; Lock & Peters, 1999; Wood & Collard, 1999).

Since the discovery in 1940 of significant rock art[130] in the *Lascaux* caves in France, several sub-cultures have been identified by paleoanthropologists (Conard & Bolus, 2003). These are detailed in Appendix C. There is currently much debate in archaeological and other discourses that study human origins. The new field of evolutionary psychology[131] is a quasi-scientific field that investigates such matters (Sedikedes, Skowronski, & Dunbar, 2006). However, even within this field there is contestation regarding the evolution of what is called *symbolic self*: the ability to "consider the self as an object of one's own reflection;" "to store the products of such reflections in memory;" and to regulate its relations with the "social and physical environment" (Sedikedes, Skowronski, & Dunbar, 2006, p. 56). Constantine Sedikedes and his colleagues propose that the *human self* emerged with the "cultural revolution . . . in Africa some time prior to 100 [thousand years ago]" (p. 66). This is considerably earlier than the widely held belief that it was simultaneous with the explosion of cultural activity in the Upper Paleolithic period in Europe around c. 40,000 years ago. A recent edited book has explored—perhaps for the first time—an archaeological theoretic perspective that considers the possible role of the individual in Lower and Middle Palaeolithic times (Gamble & Porr, 2005). The latter points beyond the dualism of cultural explosion and gradualist models to "a complex mosaic pattern of cognitive advances" (Clack, 2005, p. 281). The notion that individuals as such existed in these times and could be situated in their "landscapes rather than their evolutionary stages" (Clack, 2005, p. 282), may lend some indirect support to the heterodox notions of Steiner and Wilber that at any one time in evolutionary human history there have been groups of individuals, in each cultural landscape, operating at higher developmental levels than the majority of humans.

---

[130] These discoveries lent support to the modernist bias in archaeological and anthropological research of the time that was already Eurocentric. However, research in recent decades, particularly in Australia and India, points to significantly earlier rock art (Bednarik, 2003b; 2003c).

Another major change that is arising is arguably part of what I will speak more about in the penultimate section of this paper—the evolution of discourses through the emergence of postformal-integral-planetary consciousness. In fields such as archaeology and anthropology the shift from modernism to postmodernism is particularly evident leading to a spectrum of theories in relation to evolution, development and progress (Barnard & Spencer, 1998; M. Johnson, 1999). Archaeology professor Julian Thomas refers to the need to introduce hermeneutic, phenomenological, feminist and post-structuralist philosophies into the field of archaeology (Thomas, 1998, 2004). Such a postmodern approach to archaeological research is being undertaken by rock art scientist Robert Bednarik, who has been developing a more postformal epistemological approach incorporating taphonomy,[132] cultural hermeneutics, and notions from the field of semiotics (Bednarik, 1994, 2003b, 2003c, 2006a; 2006b). Numerous non-Anglophone scholars[133]—particularly from Eastern Europe are pursuing a postformal, semiotic approach to their archaeological research (Antonova & Rayevsky, 2002; Gheorghiu, 2002; Klejn, 2005, 2006; Stoliar, 2006; Yevglevsky, 2002, 2005, 2006).

---

[131] Evolutionary psychology as a field is largely subject to the materialistic biases of much of the biological evolution discourse (Loye, 2004).

[132] *Taphonomy* refers to the "study of the processes affecting rock art after it has been executed, determining its present appearance and statistical properties" – IFRAO Glossary (Bednarik, 2007, p. 199).

[133] Much of this work appears in a three-volume series that was published in the Russian language. I have been able to discern the relevance of this work from access to the abstracts which are available online in English. http://www.donnu.edu.ua/hist/archgroup/en/sem1/

Terminology Issues

Steiner, Gebser and Wilber all refer to the notion of magic—or magical thinking—as being a significant factor in this second major movement of consciousness.

Another complexity is that the temporal placements of this movement of consciousness are contradictory. Gebser points to the possibility that there may have been "one or even two further structures of consciousness between the archaic and magic, such as a "post-archaic" and a "pre-magical" structure" (Gebser, 1949/1985, p. 45). Because of lack of evidence to support this theory he proposes that:

> The magic "epoch" as we see it, not only encompasses an extended "era" but also a variety of modes of manifestation and unfolding that are only imprecisely distinguishable from one another. [Yet] . . . we shall consider all such modes to be manifestations of magic [consciousness]. (Gebser, 1949/1985, p. 46)

Gebser's focus for the magic structure is mainly on the Upper Paleolithic cave paintings in Europe—particularly hunting scenes. Incidentally this perspective was quite conventional within early 20th century anthropology, arising from the "first round" of ethnographic interpretations of "art-as-hunting-magic" (Conkey, 1999, p. 300). He also draws on examples of magic consciousness from much later times where he claims that it overlaps with his notion of mythic consciousness that emerged approximately 3,000 BCE (Gebser, 1949/1985, p. 57). Wilber, on the other hand, regards what he calls the "magical-typhonic period" as beginning with *Homo Sapiens* and extending up to the end of the Paleolithic period. Incidentally, Habermas, uses the term "magical-animistic" to refer to the representational world of Paleolithic societies (Habermas, 1979, p. 104). (See Appendix A for more discussion of issues surrounding constructions of time.)

Steiner also refers to a major movement of consciousness up to the end of the glacial period for which he uses the anachronistic term *Atlantean* in much of his writing, which was a conventional archaeological term in his day. In the early 20th century when Steiner was writing, literary and archaeological writing referred to Plato's references in both the *Critias* and *Timaeus* to an ancient civilization—*Atlantis*—that had been destroyed by climatic catastrophe approximately 9,500 BCE.[134] Comparative literature researcher, André Spears, reviews and discusses references to Plato's Atlantis theory in the literary/philosophical works of D. H. Lawrence, Antonin Artaud and Charles Olsen (Spears, 2001). He also notes "through the 19th and early 20th centuries, it was not uncommon for archaeologists working in Mexico to link Mesoamerican civilization . . . with the legend of Atlantis" (Spears, 2001). This was the academic context of Steiner's usage of the term *Atlantean* for the glacial age. Steiner (1904/1959) also noted that the culture and consciousness he referred to in this period also took place "in the neighboring regions of what today is Asia, Africa, Europe, and America. What took place in these regions later, developed from this earlier civilization" (p. 41). Intriguingly, some recent European archaeological and paleo-geological research has provided some tentative support for the claims in Plato's dialogues.[135] However, space does not allow a further digression.[136] Perhaps the story of Atlantis may not be over yet.

---

[134] This dating by Plato bears a striking synchronicity with the flooding that occurred at the end of the Younger Dryas, as discussed earlier, and the beginning of the Holocene geological epoch.

Key Features of Magic Consciousness

Gebser (Gebser, 1949/1985) draws attention to several key features of this structure of consciousness.

- Spacelessness, timelessness, unitive interconnectedness, merging with nature;
- The egolessness of magic human, embeddedness in the tribe;
- The magic response to Nature, by "standing up to Nature" and becoming a "Maker," thereby becoming conscious of his/her own will (p. 48);
- The flourishing of art—music, song and painting. (See Appendix C).

As demonstrated below, Steiner and Wilber describe similar features.

Spacelessness, Timelessness, Unitive Interconnectedness, Merging With Nature

Gebser (1949/1985) regards these first four features to be intimately inter-related.

> The spaceless and timeless phenomena [that] arise from the vegetative intertwining of all living things [as] realities in the egoless magic sphere. . . . earth-bound and earth-imprisoned, natural and primal . . . [requiring] the almost superhuman attempt to [be] free . . . from the fusion with nature. (p. 49, 51)

It is not hard to see the resemblance between Gebser's scene and the following depictions of Steiner (1954/1981a).

> [Their] dwellings were put together by what was given by nature; [they] molded the stones and bound them together with the growing trees. [Their] dwellings were formed out of living nature, were really transformed natural objects. (p. 131)

This appears to hint at the cultural ancestry to some of the later megalithic structures of European and Meso-American cultures. Wilber (1996c) also describes this interconnectedness with nature that characterized the magic consciousness.

---

[135] Recent scientific research in the area of the Spartel "paleoisland" off the Iberian peninsula has provided some support for the claims in Plato's dialogues regarding the place and time of the Atlantean catastrophe—via volcano and floods. Independent studies include: the archaeological findings of German archaeologist, Rainer W. Kühne (2004) relating to significant sea level rise around 9,000BCE as a result of melting ice; French palaeogeologist, Marc-André Gutscher (2005) has also found evidence of major volcanic activity consistent with Plato's account.

[136] A substantial academic overview has been undertaken of the various research perspectives on the topic of Atlantis (Wallis & Spencer, 2003).

> Man's original fusion with the world . . . with its landscape and its fauna, has its best-known anthropological expression in totemism, which regards a certain animal as an ancestor, a friend, or some kind of powerful and providential being. (p. 50)

For more detail on the timelessness of the magic structure, refer to Appendix A.

The Egolessness of Magic Human, Embeddedness in the Tribe

All three narratives characterize the social groupings as being based on what Wilber (1996c) called "kinship ties" (p. 72). Steiner referred to "little tribes that were still preserved through blood relationship, whilst a powerful authority was exercised by the strongest, who was the chieftain . . . (Steiner, 1954/1981a, p. 131-133). Gebser related this to:

> The egolessness of the individual—who is not yet an individual—demands participation and communication on the basis of the collective and vital intentions; the inseparable bonds of the clan are the dominant principle. (Gebser, 1949/1985, p. 58)

The Magic Response to Nature

Gebser notes that the struggle to develop beyond the forces of nature led to consciousness of will forces. Steiner made a similar claim: "[They] had . . . a very powerful will. . . . Thus they exercised a powerful influence over Nature. . . . They pressed the powers of nature into their service" (Steiner, 1986a, p. 95-96). Gebser (1949/1985) also saw this striving to become independent of nature as providing the impulse for the magical power.

> Here lies the basis of all sorcery and magic, such as rain-making, ritual, and the countless other forms by which magic [human] tries to cope with nature. (p. 51)
> . . . Magic [human] possessed not only powers of second sight and divination, [s/he] was also highly telepathic. (p. 55)

Steiner foreshadowed Gebser's claims about these magical relationships with nature. He noted however, that not all the humans at that time had these abilities to a high degree.

> At the height of [this] culture there were seers, clairvoyants and powerful magicians who worked by means of magical forces and were able to see into the spiritual world.
> . . . Beside [the magicians], were people who were preparing to be the founders of present humanity. . . . They possessed the elementary faculties of calculation, computation, analysis and so forth. They were the people who developed the rudiments of the intelligence of today and no longer made use of the magical forces . . . (Steiner, 1978b, pp 96-97)

This aligns to Wilber's view. He proposed that in addition to the majority of the people who were operating at an early level of consciousness,[137] the more advanced individuals had magical powers related to what we would now call *shamanism* (Wilber, 1996c, p. 75, 339).

---

[137] A feature of Wilber's (1996c) evolutionary approach is that he traces what he calls "*two* parallel strands of evolution: the evolution of the *average mode* of consciousness and the evolution of the *most*

The Flourishing of Art—Music, Song and Painting

Much has been written about the appearance of cave art and interpretations of its possible meaning. Gebser and Wilber both emphasize the art-as-magic interpretation. Wilber's (1981/1996) explanation is that the "subject and object, psyche and world, were not yet fully differentiated . . . [thus] between the object and the symbol of the object "existed a magical rapport." To manipulate the symbol was to affect the object symbolized" (p. 51). In spite of Gebser's (1949/1985) adoption of a similar view he also claimed that the sensory emphasis of the magic consciousness was primarily auditory rather than visual.

> It is this auditory aspect, not the imagistic or pictographic, which we will have to attribute to the initial phenomena. . . . Sonority and music, not image or sign, are the inceptual and coincident manifestational and realizational forms of the magic structure, where they still form a unity. (p. 125)

Steiner pointed towards the development during this period of tonal speech, and also suggested that this was when the musical qualities of language—that had begun with chanting and dancing—were being further developed as a way in which the sense of the self could began to arise in individuals (Steiner, 1904/1959, p. 82). Gebser (1949/1985) drew attention to the tonal quality in Chinese and other related languages that apparently still retain this more musical quality (p. 126). (Much more is demonstrated on the relationship between language and the arts in Appendix C.)

Deficient Manifestations of Magic Consciousness

Gebser used the terms *efficient* and *deficient* when speaking about the structures of consciousness—both in regard to transitions between structures and in regard to the expression of various earlier features at later stages. Similarly Wilber uses the terms *healthy* and *pathological*. While Steiner does not have a specific equivalent pair of terms, he does take a similar view in regard to cultural transitions. Another pair of terms that has been used in a similar manner, in psychotherapy discourses is *formative* and *deformative* (Boadella, 1998). The language of deficiency and pathology is somewhat problematic in the light of contemporary research on psychological stage transitions (Commons & Richards, 2002). However, it is a part of all three of these narratives so will be referred to at various points in the narrative where it is relevant to the discussion.

From Gebser's (1949/1985) perspective, the deficient aspect of a structure of consciousness primarily occurs in the later period of its development.

> The exhaustion of a consciousness structure has always manifested itself in an emptying of all values, with a consistent change of efficient qualitative to deficient quantitative values.

---

advanced mode of consciousness (p. 339). He also claims "the true shaman—was the first great voyager into realms of the superconscious (p. 75). Although Wilber claims that, as far as he knows, such an approach has never been explicitly followed before (p. 75), as we have seen, Steiner's narrative is underpinned by a similar view.

> It is as if life and spirit withdrew from those who are not co-participants in the particular new mutation. (p. 538)

Steiner concurs that faculties tend to become deficient or decadent towards the end of a developmental period. In relation to the pre-glacial (archaic), and glacial (magic) periods, he referred to overuse of the powers or abilities that had been developed, to the point that they became decadent. He also indicated that each of the major (post-glacial) cultures and civilizations had their flourishing followed by their decadent period in a kind of cyclical rhythm. Wilber is more inclined to take a dialectical view in regard to all the earlier stages of consciousness. He has a strong interest in countering any romanticism towards the early stages of human development. He continually points to the negative or pathological aspects of the earlier cultures and civilizations.

Gebser (1949/1985 referred to the deficient form of magic consciousness as “witchcraft and sorcery [which] is immoderate and unmeasured” in contrast with the efficient form as “spell-casting which retains the character of moderation” (p. 94). One of the unique contributions that Wilber (1981/1996) makes to illuminating the earlier structures of consciousness is that he does not romanticize them—if anything he emphasizes the darker side of what for him are clearly *lower* stages of consciousness.

> The self was indeed magically connected with the environment, but for that very reason it was also unprotected from invasion by unconscious elements within and extrasomatic factors without. . . . a time of danger, a time of taboo, a time of superstition. (p. 56)

Steiner pointed out the difference between what he called white magic and black magic, where the increase of the latter—the use of magic for immoral, selfish ends—led to the decadence and decline of these early magic cultures. Gebser (1949/1985) noted its deficient manifestation during his times in the “mass psychology” evident during the 2nd World War in Europe (p. 60). Gebser also made an interesting point that there is a strong affinity between the deficient mental—that is, rational—and deficient magic structure, resulting in a strong propensity for regression from excessive rationality to a deficient magic consciousness.

> Whenever we meet up with overweening emotionalism as in mass assemblies, propaganda, slogans . . . we are dealing mainly with essentially deficient manifestations of magic.
> Their deficiency can be recognized by their very claim to exclusivity, as if they alone had validity or worth in contrast to the validity of other structures and forms of manifestation. (p. 154)

Gebser (1949/1985) saw the deficient magic tendencies as potentially dangerous, even terrifying. Because of its unconscious nature, its “striving for power” and connection with “loss of ego and responsibility” he was concerned that “the unconsciously activated magic structure will ultimately (at least for us today) lead—via the atomization of vitality, the psyche and the ego—to destruction” (p. 60). He felt compelled to make these tendencies transparent so that even if we could not prevent them we could at least avoid becoming submissive to them.

Summary and Relevance for Today

Magic is clearly an academically contentious notion today, particularly in the scientific arena. Since the European Enlightenment, the dominance of scientific rationalism has dismissed such notions as regressive.[138] This view persisted in the Academy until the late 19th century. In a context of rationalistic and primitivist views of non-European cultures, a classical anthropologist Sir James Frazer, wrote a seminal anthropological text on magic and religion, *The Golden Bough*, re-opening the territory (Frazer, 1922/2000). Frazer described magic as a type of pseudo-science—a first stage in the evolution of human thought; followed by religion; and then what he called "true, experimental science" (Barnard & Spencer, 1996/1998, p. 341). Since then, the notion of magic and its place in culture has become of ethnographic interest to social and cultural anthropologists—including such notables as Claude Lévi-Strauss (Levi-Strauss, 1963). A spectrum of theoretical perspectives has arisen over the last century, many grounded in fieldwork and/or influenced by postmodern philosophical perspectives, such as pluralism and cultural relativism. These theories have been summarized by Barnard & Spencer (1998).

- Notions of magical phenomena as objectively real, even if inexplicable in terms of Western scientific knowledge—based on field experience with South American and African shamans, it has been called *radical empiricism*;
- Explanations for postmodern beliefs in magic, including notions of empirical validity outside orthodox science, different physical and spiritual laws, epistemological relativism and subjective, metaphorical value;
- A reformulation of theories based on laboratory research in parapsychology;
- Philosophical considerations of the apparent congruence between traditional magical philosophies of an organic, interconnected universe, and the New Physics theories on the unity of mind and matter (p. 342).

The renewal of interest in the marginalized Hermetic writings of Kepler, Newton and others may reintroduce many more questions about magical consciousness in the coming times. Gebser's (1949/1985) interest was to bring our conscious awareness to the magical nature of our instincts and impulses so that they can be a "serving and sustaining potency" (p. 60). He spoke of music as one of the most powerful means to activate the magic timelessness in a way that is appropriate for our times. He also referred to prayer as a constructive engagement of the type of psychic connectionism that is inherent in magic consciousness.

Transition

Because of the complexity and divergence of opinion on the timing and nature of the transition between magic and mythical consciousness I have devoted a separate section in my narrative to this transition. We will now consider this aporia[139] in detail.

---

[138] However, as noted elsewhere in this paper, several of the originators of modern science—Kepler, Newton—were also scholars of the Hermetic sciences of alchemy and astrology. These were linked to magical consciousness, for example, in Paracelsus.

[139] The term *aporia* is from the Greek word meaning *impasse*, or *puzzle*. It was used frequently by Plato in his philosophical writings, and also more recently by Derrida.

5. The Magic-Mythical Transition: A Complex *Aporia*

> Firstly came the hunting peoples, then the farming peoples and thirdly the development of mining,[140] which brought to light what is under the Earth. (Steiner, 1982a, Lecture XXX)
>
> These animal breeders as well as the hunting and nomadic cultures, are predominantly rooted in the magic culture. Strictly agricultural cultures on the other hand already take part in the mythical structure. (Gebser, 1949/1985, p. 305)
>
> Farming was the most obvious *effect*, or perhaps vehicle, of a deeper transformation in structures of consciousness: it was the earliest expression, that is, of a shift from magical-typhonic to what we will call mythic-membership consciousness (level 3). (Wilber, 1996c, p. 93)

There appears to be something of a cultural hiatus or *aporia* in the period between the end of the Younger Dryas—approximately 9,500 BCE and the beginning of the Neolithic[141] period (c. 8,000 BCE). This roughly demarcates the period referred to as the Mesolithic[142] (c. 10,000-8,000 BCE) an archeological period that appears to have a dramatically reduced status compared to the Paleolithic and the Neolithic. This is perhaps not surprising considering the dramatic environmental change occurring, during which “most of the final (warming) transition may have occurred in just a few years” (Colman, 2007, Abstract). Between the height of the cultural activity of the Upper Paleolithic glacial period and the establishment of agricultural settlements in the fertile crescent of Mesopotamia—China’s Yellow River and the Indus and Nile valleys—the sea level rose approximately 120 meters, with much of this occurring between 12,000 BCE and 8,000 BCE.[143] Geoscientists have demonstrated the significance of the end of the last glacial age by introducing a new geological epoch—the Holocene[144] Epoch which continues into the present time. This also conventionally marks the beginning of the Neolithic period. As the geo-climatic conditions began to stabilize, the climatic changes associated with the end of glaciation actually facilitated the development of farming of cereals and the domestication of sheep, goats, pigs and cattle through the warmer climate and flooding of river basins.

---

[140] This section deals with the transition from the hunting to the farming peoples. In the following section, when mythical consciousness fully awakens, we are dealing with the mining peoples—the beginning of the bronze and iron ages. Interestingly, Teilhard de Chardin also refers to a similar three phases: a “thin scattering of hunting groups” of the Ancient World; a more dense scattering of “agricultural groups installed in fertile valleys;” and, the “first civilizations” (Teilhard de Chardin, 1959/2004, p. 169-170).

[141] Although *Neolithic* literally means ’new stone age,’ the term is generally used to refer to the cultural movements of agriculture and pastoralism and the social organization features, such as larger settlements, to accomplish them (Barnard & Spencer, 1998, p. 615).

[142] The term, *Mesolithic*, refers to the middle ‘stone age’ period between the Paleolithic and the Neolithic. It is generally associated with European development at the end of the glacial period, and is characterized by “microlithic industries” (Barnard & Spencer, 1998, p. 613).

[143] This dramatic sea level data is sourced from the Goddard Institute for Space Studies, NASA, New York. http://www.giss.nasa.gov/research/briefs/gornitz_09/

[144] Holocene comes from Gk. *holo-,* combined form of *holos* "whole, entire" + *kainos* "new, recent." Adapted from the Online Etymology Dictionary, http://www.etymonline.com/index.php.

As mentioned previously, there are discrepancies between Gebser's and Wilber's temporal situating of magic and mythical consciousness. My interpretation is that the period c. 9,500-3,000 BCE is a significant period of transition between magic and mythical consciousness throughout the world. This period encompasses the latter part of Gebser's magic as well as Wilber's low mythic-membership period (9,500-4,500 BCE) and the beginnings of his high mythic-membership period (4,500-1,500 BCE) (Wilber, 1996c, p. 110). There are also contradictions within Gebser's own dating of this transition.[145]

I propose that Steiner's narrative makes a unique contribution to the understanding of this lengthy transition period. Firstly, he acknowledged an ecological condition of great geo-climatic instability from the end of the ice age. Secondly, he drew attention to the potential influence on culture and consciousness of the *precession of the equinoxes*[146] every 2,160 years approximately.[147] Steiner identified two specific cultural periods prior to 3,000 BCE—the Asiatic, or ancient Indian (c. 7,200-5,000 BCE); and the ancient Persian (c. 5,000-3,000 BCE). Incidentally, Gebser (1949/1985) also identified two major cultural epochs—the domesticating-agricultural, and the tool-making and craft cultures.[148] He particularly noted the significance of the shift from domesticating to agricultural cultures in relation to the transition from magic to mythical consciousness (see introductory quote). He regards the former as tribal and the latter as matriarchal societies attuned to the cycles of "maternal realm of the earth" (p. 305). Wilber (1996c) concurs that the great planting cultures that led up to the development of the city-states, were both mythic and matriarchal (p. 124). Wilber also discussed the significance of farming in facilitating the major cultural developments that occurred during the next few millennia.

Of particular interest in Steiner's narrative about this transition period is the ancient pre-history of Asia—particularly India—and Mesopotamia[149]—Persia-Sumeria. Although he did extensive research on these cultural periods, giving hundreds of lectures that have been published in dozens of volumes, I can introduce only a few fragments within the space of this section. He focused on these particular regions during that period based on his claims that: (a) they provided continuous, genealogical links to a cultural tradition of ancient spiritual wisdom; (b) their philosophical and scientific traditions were foundational to later European[150] philosophical, scientific and cultural developments; and (c) the cultural activities that took place there were significant in enabling the refining and consolidating of important subtle aspects of human biological and psycho-spiritual development.

---

[145] When first introducing the structures of consciousness, Gebser notes that the mythic structure begins to overlap the magic in the third millennium BCE (p. 57). However, elsewhere he notes that the mythic-matriarchal structure underpinned agricultural societies that, as we know today, were well in existence prior to 3,000 BCE. Perhaps he added this information later for the second edition in 1966, as indicated by this comment: "Recent developments in anthropology have enabled us to discern two major successive cultural periods" (Gebser, 1949/1985, p. 305).

[146] This astronomical cycle and its influence on the earth, culture and consciousness, is discussed in some depth in Appendix A.

[147] Steiner also discussed similar cyclical periods prior to the 8th millennium BCE but it is beyond the scope of this paper to discuss them (Steiner, 1971a, p. 112-113).

[148] Gebser located the tool-making and craft cultures within the later, mental-patriarchal structure.

[149] My interpretation is that Steiner is referring to a broad region here including Mesopotamia and the Levant to its West.

[150] A critique that could be leveled at such a narrowing of cultural focus is that it is Indo-Eurocentric. It cannot be denied that the people and cultures of other parts of the world are also significant and also have their cultural and spiritual traditions. I propose that a belief in the significance of the Indo-European

Jungian depth psychologists and transpersonal psychologists—including Wilber—have contributed significantly during the 20th century to increased understanding of subtle aspects of human psycho-spiritual development (Bache, 2000; Boadella, 1998; Ferrer, 2002; Grof, 2000, 1988; Jung, 1990; Orme-Johnson, 2000; Walsh & Vaughan, 1993; Wehr, 2002; Wilber, 1996b, 2000b; 2005b, Part I). Steiner also undertook significant phenomenological research into the subtle dimensions of human psychology but this has been largely overlooked even in transpersonal psychology.[151] Steiner proposed that in addition to the physical body, in order for humans to function in the complex ways that we do today, other more subtle bodies also needed to be developed in our species as a whole. He identified a *life body*[152] through which our energy and vitality flows and an *emotional body*[153] through which we experience feelings and passions (Steiner, 1909/1965). Both Gebser (1949/1985, p. 67, 261) and Wilber conflate the vital and emotional dimensions to some extent, perhaps contributing to the complexity of the transition from magic to mythical consciousness. Wilber (2005a, Part 4, p.1) conflates them by using the hyphenated term *vital-emotional* that he attributes incorrectly—according to my research—to Sri Aurobindo.[154] While this is a vast area of research beyond the scope of this paper, what is relevant is that Steiner claimed that these *subtle bodies* were being developed and refined during this period of evolution—the *life*, or vital, body in the first cultural period, that he called the ancient Asiatic/Indian, and the *emotional* body during the second cultural period, that he called the ancient Persian (Steiner, 1910/1939, 1986a, 1990a). Several contemporary researchers have begun to research and extend Steiner's approach to spiritual psychology (Kuhlewind, 1988; Sardello, 1990, 1995). A beginning has also been made in researching the relationship between Jung's depth psychology and Steiner's spiritual psychology (Wehr, 2002).

This section may contribute potential new insights into subtle aspects of the evolution of human biopsychology.

---

heritage for global cultural development is a bias of the integral consciousness movement (including Steiner, Gebser and Wilber). One of my interests is to make this bias more explicit, so that it can be balanced in the future, but it is beyond the scope of this article to discuss.

[151] Much of the transpersonal psychology that has developed in the USA—with significant contributions from Wilber—privileges eastern spiritual traditions over the western traditions that Steiner reflects. Jorge Ferrer (2002) critiques this eastern-centric aspect of transpersonal psychology yet also omits Steiner's contribution. There are however several transpersonal theorists who do recognize Steiner's contribution in this area (House, 2004; Kuhlewind, 1988; McDermott, 2001; Sardello, 1990, 1995; Tarnas, 1991).

[152] Steiner also used the term *etheric body*. Sri Aurobindo (2000) uses the term "vital body" in a similar sense (p. 216).

[153] Steiner also used the term *astral body*. Sri Aurobindo (2000) also refers to "the ancient idea of a subtle form or body inhabited by a psychic . . . or soul entity, carrying with it the mental consciousness" (p. 780).

[154] Sri Aurobindo's characterizations of the vital/life and emotional/psychic energies/bodies are far more intricate and subtle than a simple hyphenated conflation of vital-emotional could denote (Aurobindo, 2000, p. 216, 780). Also in 526 pages of writings and essays between 1910 and 1950, he does not use the hyphenated term *vital-emotional* (Aurobindo, 1997).

The First Post-Glacial Cultural Period—Earth as *Maya,* Spirit as Home

> The profound Vedas, the Bhagavad-Gita, that sublime song of human perfection, are only the echoes of that ancient divine wisdom. (Steiner, 1986a, p. 99)

The first significant post-glacial cultural period that Steiner proposed was the *Asiatic*—earlier called *Ancient Indian*—cultural period (c. 7,200-5,000 BCE) (Steiner, 1971a, p. 51-53). He commented elsewhere that the evolutionary developments that occurred during this period affected all people inhabiting the planet. At this time—early Neolithic—most people were still nomadic, although some farming had commenced in the area known as the "fertile crescent," which we will visit in the next section. Steiner claimed that some of the ancient south Asian—particularly Indian—people of this early Neolithic period embodied a sublime spiritual wisdom.[155]

Indology scholar, Asko Parpola (2005) presents a contemporary academic perspective on this view.

> The Indus Civilization came into being as the result of a long cultural evolution in the Indo-Iranian borderlands. From the first stage of development, about 7000–4300 BCE, some twenty relatively small Neolithic villages are known, practically all in highland valleys. (p. 29)

Key Features of the First Post-Glacial Cultural Period

Steiner pointed to several key features that characterize the development of the culture and consciousness of this period, particularly in India. Although Gebser and Wilber mention some of these features in passing—in relation to cultural practices in the early Indus civilization—neither of them have identified a specific Indian or Asian cultural period during the magic-mythic transition.

- Earth as *Maya*, Spirit as Home;
- Internalization of rhythms of nature through poetic speech;
- Development of spiritual practice or Yoga;
- Sanskrit as complex language development.

Earth as Maya, Spirit as Home

According to Steiner, the ancient Indians perceived the physical world around them to some extent as an illusion (*Maya*), regarding the spiritual cosmos as their true home and resulting in a mood of "longing" in their souls (Steiner, 1910/1939, p.200). He claimed they regarded the earth as the lowest part of this spiritual cosmos, and that it was permeated through and through with

---

[155] Steiner also proposed that this was the case with several ancient cultures—notably the Indian, Chinese and Meso-American—where a type of recapitulation of different lineages of ancestral spiritual wisdom *informed* their cultural development. I propose this could be taken in László's (2007) sense of *informed* universe.

Spirit (Steiner, 1950, p. 24). Steiner also claimed that as a result of the rising sea levels, they had migrated over time through Europe—led by their leader *Manu*[156]—to settle in the Indian subcontinent. He also referred to cultural and spiritual leaders in this period as the *Holy Rishis*, the name used in ancient Indian sacred texts, such as *The Ramayana and Mahabharata* (Steiner, 1986a, p. 99). Steiner pointed to the sacred texts, the *Vedas* and the *Upanishads*—at first handed down orally and later formalized in writing—as the echoing vestiges of this great wisdom. While Gebser (1949/1985) refers only briefly to some revelations of the *Upanishads* (p. 210), Wilber (1996c) draws quite strongly on some of the ancient Indian sacred texts, claiming—like Steiner—that they were originated by the leading-edge of culture at the time (p. 255-257). Of the three, Gebser draws more strongly on the ancient wisdom of China. (For more information on cultural-aesthetic developments in China during this period, see Appendix C.)

Internalization of Rhythms of Nature Through Poetic Speech

Steiner pointed to a significant feature of the ancient Indian culture in relation to the development of rhythm. He claimed that they experienced a special relationship with the seasonal rhythms and cycles of nature through which they developed a sense of rhythm in their thoracic organs (heart and lungs) (Steiner, 1971a, p. 52). Steiner (1950) proposed that this was enhanced by the rhythmical repetition of chanting—the later echo of this being found in long epic poems, such as the *Bhagavad-Gita* and the *Vedas*, which resounded from the rhythms of their hearts (p. 18). He claimed that this rhythmic repetition strengthened the vital body as discussed above and also facilitated a new internalized form of human memory (p. 18). (See the section on Rhythmic Memory in Appendix A). It is interesting to note that the lineage of much of Wilber's spiritual nomenclature goes back to Vedanta Hinduism (Wilber, 1996c).

Complex Language Development

Steiner proposed an important relationship between the rhythmical processes that facilitated the internalization of memory, and language development (Steiner, 1984c). Linguistic research indicates that during the Neolithic period—around 5,000-7,000 BCE—language developments included, functional diversification of speech, more autonomous speech forms within communities, more precise and explicit forms, analogical correlations and the beginnings of grammar (Foster, 1999, p. 772; Kay, 1977). Clearly in order for language to develop such systemic components, significant memory capability needed to be in place.[157] The language development of the ancient Indians—later classified as *Sanskrit*—is one of the major common roots of the Indo-European[158] language (Foster,1999; Lock & Peters, 1999).

---

[156] In the epic poem of *Rama*, the ancient Prince of India, which is included in the sacred Indian text *The Ramayana and Mahabharata,* appears the line: "Like the ancient monarch *Manu*, father of the human race." http://www.sacred-texts.com/hin/dutt/rama01.htm
This appears to corroborate Steiner's narrative, which may benefit from some further archeo-anthropological research.

[157] For more discussion on language development, see Appendix C.

[158] This entire language group, ranging from Hindi and Persian to Norwegian and English, is believed to descend from the language of a tribe of nomads roaming the plains of eastern Europe and western Asia as recently as about 3000 BC.
http://www.historyworld.net/wrldhis/PlainTextHistories.asp?paragraphid=axx#axx

This is the most widespread group of languages—spoken by around half the world's population.[159] Sanskrit terminology is also used by several integral theorists and in other contemporary spiritual literature to characterize potential transpersonal human development.[160] It is possible that it contains nuanced meanings in relation to subtle body relationships and spiritual development that have not yet been adequately expressed in modern languages such as English.

Development of Spiritual Practice or Yoga

Steiner's major emphasis with this cultural period is that humans began to experience the loss of spiritual connection, the separation from their Cosmic/spiritual *homeland*, and the longing to go back to Spirit. He claimed that the ancient Indians were the first to develop practices to assist in the spiritual re-integration of human beings (Steiner, 1986a). This lineage exists to this day in India and many yoga masters have also taken their teachings to other cultures.[161] Steiner also noted that the Chinese culture of this time also contained great spiritual wisdom, which was even more ancient. The Chinese movement form of Tai Chi could also be regarded as having a similar purpose. However, its history was not purely integrative but martial—apparently originating from Indian yoga, but taking a turn towards boxing in the Chinese context.[162]

Summary and Relevance for Today

In summary, before farming was fully established, before writing was developed, and before the building of city-states, these ancient humans had already developed a highly sophisticated schooling in spiritual practices.

> Yoga was the name of the training [they] had to undergo in order to penetrate through the illusion to the spirit and primal source of being. . . . The Indian turned away from everything external and looked for a higher life only in world-renouncing ascent to the Spirit. (Steiner, 1986a, p. 99-100)

---

[159] Data on the Indo-European Language Group, sourced from the National Virtual Translation Center of the Intelligence Services of the US Government http://www.nvtc.gov/lotw/months/december/IEFamily.html

[160] For example both Steiner and Wilber foreground the Sanskrit term *Atman* for the Higher spiritual Self and both Steiner and László use the Sanskrit term *Akashic* to describe the universal information field (László, 2007; Steiner, 1904/1959; Wilber, 1996b).

[161] However, Steiner also claimed that, while yoga was an ideal practice for human development at that time, spiritual practices need to be adapted to keep up with the biopsychosocial developmental changes that have occurred through evolution. Gebser (1949/1985) also makes the point that "the Yoga techniques appropriate to the Orient are most likely not in accord with our consciousness structure" (p. 245).

[162] A Tai Chi center connected with the education faculty at the Middle Tennessee State University, claims: "In China yoga came to be developed into what is called *Saolin chuan* ("chuan," briefly, means boxing). " However Tai Chi today in the West is mostly of the softer variety, "Unlike the hard martial arts, tai chi is characterized by soft, slow, flowing movements that emphasize force, rather than brute strength." http://www.mtsu.edu/~jpurcell/Taichi/taichi.htm The ancient Chinese knowledge of the life currents and energies in the human body, are also demonstrated in the healing art of acupuncture.

Such perspectives—if researched at all in the Academy today—are generally sequestered away in faculties of religion or subbranches of ancient history. I propose that it is time to integrate such material with the biological and evolutionary psychology discourse. Like Steiner, Gebser and Wilber, Sri Aurobindo's work is of great significance to a new evolutionary narrative that can assist us to evolve ourselves out of our cultural and planetary hiatus. Writing at the same time as Steiner (1914-1920), he made the following plea for the active development of "integral consciousness."

> An integral consciousness will become the basis of an entire harmonization of life through the total transformation, unification, integration of the being and the nature. (Aurobindo, 2000, p. 755)

This is the spiritual lineage that Steiner is referring to in this first post-glacial period. It continues on in the integral consciousness movement of our times, potentially providing a nourishing alternative cultural pre-history to the *primitivism* that still exists in many evolutionary biology narratives. I suggest that the revival of interest in Eastern spiritualities among Westerners in recent decades reflects a searching for some of this ancient spiritual wisdom that has been increasingly suppressed in the last three centuries by the narrowing of rationality and the excesses of materialism. While clearly my research poses more research questions than it answers, it does re-open the territory.

The Second Post-Glacial Cultural Period—The Persian *Magi* and the Fertile Crescent

> The peoples of this second period had a different task. . . . In their longings and inclinations they did not turn merely toward the supersensible, for they were eminently fitted for the physical sense world. They grew fond of the earth. (Steiner, 1910/1939, p. 203-204)

Steiner's second post-glacial cultural period flourished from c. 5,000-3,000 BCE (Steiner, 1971a, p. 53). Archaeologically, this was the height of the Neolithic farming period. The geographical and cultural focus of this period was the region known as Mesopotamia, between the Tigris and Euphrates rivers, in the area that later became Babylonia and is now southern Iraq, from Baghdad to the Persian Gulf. This region is widely recognized as being the home of the earliest known civilization[163] and is still known today as the "fertile crescent." It is notable that domestication of animals and farming of cereals had also begun by this time in Africa, with the Nubian culture of the Sudan having already developed some of the features of the later dynastic Egyptian culture, such as ceramics and elaborate burial tombs, culturally mediating between Egypt and the southern and western regions of Africa (Gatto, 2004).

Steiner called this second cultural period *ancient Persian*—because it developed in the region later known as Persia. The type of consciousness emerging in Steiner's Persian period, resembles Gebser's mythic consciousness, yet contains magical elements, supporting my notion of this being a transition phase. Gebser explicitly refers to the Mesopotamian region as being significant in the transition between the magic and mythical cultures, though with more emphasis on developments post-third-millennium: "This paralleling and overlapping of the still-magical and just-mythical attitude is particularly evident in the many illustrations of artifacts from the two early Sumerian cultures from the third millennium onward" (Gebser, 1949/1985, p. 109). Wilber clearly places this period clearly within his myth-membership stage. His characterization of what he calls "*mythical* cognition [is a] . . . mixture of magic and logic . . . which informs and structures language itself" (Wilber, 1996c, p. 98). In this period that he calls "low myth-membership" he particularly focuses on the socio-cultural developments.

---

[163] I am using the term civilization according to its conventional formal-academic usage, while being aware that it could be deconstructed.

From a broader geographical perspective, by the time Sumeria was a powerful and prosperous city-state—around 3,000 BCE—other regions of the world were also beginning to develop in a similar way, at least the Nile Valley of Northeast Africa, the Indus Valley of South Asia, the *Huang He* (formally called Yellow River Valley) of China, and coastal Peru in South America. It is beyond the scope of this paper to discuss the apparently parallel cultural developments in these regions, however further comparative research in the future may be fruitful.

Key Features of the Second Post-Glacial Cultural Period

Several key features were identified by Steiner to characterize the ancient Persian culture and consciousness as a further continuation of the Indo-European lineage of cultural and psycho-spiritual development. Both Gebser and Wilber identify these features of development as well, though neither identified a specific cultural period during this time.

- Sense of Polarity;
- Orientation to the Earth through agriculture;
- Formation of Proto-cities;
- Magic-Mythic Transition to Organized Religions.

Sense of Polarity

Steiner proposed that these ancient Persian/Sumerians developed the beginnings of the awareness of two dimensions—polarity and symmetry—whereas the earlier cultures lived within a sense of unity. Gebser (1949/1985) concurred that the mythical structure is "the expression of two-dimensional polarity. . . . the mythical man may be said to establish an awareness of earth's counterpole, the sun and sky" (p. 66). Steiner also characterized this new awareness as a recognition of the twin natures of earth and cosmos—expressed as archetypes of Dark and Light—which became central to later Zoroastrian religious symbolism (Steiner, 1971a, p. 53).

Orientation to the Earth through Agriculture

Steiner linked this developing sense of polarity of the ancient Persians to the new orientation to the earth, compared with the ancient Indians. He noted though that they retained the sense that "external reality was an image of the Divine, which must not be turned away from but shaped anew. The Persian wished to transform nature by work" (Steiner, 1986a, p. 100). These indigenous Sumerians must have labored hard. They had to drain the marshes for planting crops;

and they developed early trade of their crafts including weaving, leatherwork, metalwork, and pottery.[164] Wilber draws attention to some of the cultural developments that arose as a result of the introduction of farming, including the production of *surplus goods* and their symbolization as *money*, in the form of gold, which developed into a *new immortality symbol* (Wilber, 1996c, p. 108).

Formation of Proto-cities

All of these developments contributed to the gradual growth of large farming settlements. Wilber (1996c) claims that by 5,000 BCE "agricultural colonization had spread throughout the Tigris-Euphrates and Nile valleys, swelling the population of some cities to 10,000 inhabitants" (p. 110). There is academic contention around the lineage of the early Mesopotamians who initiated this agricultural revolution and built the first settlements. Contemporary archaeological research suggests that, prior to the Sumerians, the Ubaidians founded an elaborate development starting around 5,000 BCE, called *Eridu*.[165] Although the ancient text called the *Sumerian King List*[166] might be regarded more as mythological than historical, it is interesting to note its opening lines:

> *When kingship from heaven was lowered,*
> *The kingship was in Eridu.*

Eridu is now known as *Abu Shah Rain*, located 196 miles southeast of Baghdad, Iraq. Archaeologists claim that it is the earliest known city of Sumer (Southern Mesopotamia), [167] lending support to the ancient Sumerian claim that *Eridu* was the first city in the world.

Magic-Mythic Transition to Organized Religions

Although Steiner noted that this culture pre-dated what is generally regarded as the *historical* ancient Persia of Zoroastrianism, he claimed that it had a strong genealogical lineage with the later historical Persian culture that echoed it. He claimed that the leader of this original ancient Persian culture could also be referred to as Zarathustra[168] (Greek: Zoroaster) (Steiner, 1910/1939,

---

[164] From *Encyclopædia Britannica*. Retrieved June 1, 2007, from Britannica Concise Encyclopedia: http://concise.britannica.com/ebc/article-9070297/Sumer

[165] The Minnesota University e-museum archaeology website notes that *Eridu* was rediscovered in the sand dunes and excavated by Iraqi archaeologists between 1946 and 1949. It is considered a very important site showing a "long succession of superimposed temples portraying the growth and development of an elaborate mud-brick architecture." These successive developments took place from 5,000-3,000 BCE. http://www.mnsu.edu/emuseum/archaeology/sites/middle_east/eridu.html

[166] The *Sumerian king list* is an ancient text in the Sumerian language listing kings of Sumer from Sumerian and foreign dynasties. http://en.wikipedia.org/wiki/Kings_of_Sumer

[167] Binek, Tracy, http://www.mnsu.edu/emuseum/archaeology/sites/middle_east/eridu.html

[168] According to Steiner, Zarathustra foresaw a potential danger that humans could become too attached to the earth, and developed his teachings in relation to the "sublime Sun or Light Spirit, Ahura Mazda and the Spirit of Darkness, Ahriman" (Steiner, 1910/1939, p. 206). It is important to note that the type of dualism that occurred in this mythic period was more of the nature of complementary polarities, than

p. 205). Until recently, this claim of Steiner's may have appeared highly speculative or even fictitious. However, a recent book revisits claims of ancient Greek and Roman historians, Xanthus, Pliny, Eudoxus and Plutarch, in the light of recent archaeological evidence. It substantially supports Steiner's claim, that an earlier Zarathustra pre-dated the historical figure by several thousand years (Settegast, 2005).[169] At the very least, these unconventional views of Steiner and Settegast pose new questions about the history and development of this highly significant region. As an indication of the lingering magic consciousness, Steiner referred to the leading people of this culture as *the Magi*—who he claimed had retained some of the magical powers of the earlier times (Steiner, 1910/1939, p. 204). Settegast also makes reference to *the Magi*, regarding them as an Order said to have been founded by Zarathustra (Settegast, 2005). The dualism of Light versus Dark became a central teaching in Zoroastrianism, which arguably influenced the monotheistic religions of Judaism, Christianity, and Islam that also developed in this general geographical region.[170] Gebser also suggests that Zarathustra's dualism underlies Parminedes' (b. 540 BCE) notion of Being opposed to Non-Being, which intriguingly straddles the next transition from mythical to mental consciousness.[171]

Summary and Relevance for Today

The convergences between our three narratives support my proposal that the developments of culture and consciousness in this second cultural period mark a significant phase in the transition between Gebser's magic and mythical structures of consciousness. I would also like to briefly draw attention to Friedrich Nietzsche's use of the Zarathustra archetype in one of his most famous books, *Thus Spake Zarathustra* (Del Caro & Pippin, 1887/2006). Although it is beyond the space available to discuss this work, Nietzsche's aim does express an interesting mirror-reversal of the Persian theme of previously spiritually oriented humans becoming oriented to the earth. He begs the question. "In what way . . . can a human being now tied to the "earth" still aspire to be ultimately "over-man," U'bermensch?" (Del Caro & Pippin, 1887/2006, p. xviii).

As a postscript to this Persian/Sumerian narrative it is disturbing to consider that at the time of writing this paper, this region of the world—modern Iraq—is still a war zone. Tragically, as a result of the two Gulf wars, much of the ancient archaeological—and thus cultural—history of

---

divisive dualism. David Boadella (1998) refers to Zarathustra's teachings, as "ecologically aware and non-dualistic" (p. 31).

[169] Based on extensive research Mary Settegast integrates this historical and archaeological evidence with the oral traditions of ancient Persia and argues that this *original* Zarathustra (circa 6,200-6,500 BCE) led his people through the transition from the nomadic to the agricultural life—including building settlements that developed into cities, creating and decorating fine ceramics, and eventually, within the same lineage, to developing some of the first writing—cuneiform writing on clay tablets (Settegast, 2005).

[170] Zoroastrianism and Parsiism. (2007). In *Encyclopædia Britannica*. Retrieved June 2, 2007, from Britannica Concise Encyclopedia:
http://concise.britannica.com/ebc/article-9383384/Zoroastrianism-and-Parsiism

[171] Gebser makes the fascinating point that Parmenides notion of Non-Being as essentially measureless and spaceless, is mythical, whereas his notion of Being is emphatically spatial; an incipient mental, measuring concept (p. 80). He also notes that Parmenides was responsible for the birth of linear time with his tripartition of time into past, present and future (Gebser, 1949/1985, p. 178). For more detail on the latter, see Appendix A.

this *cradle of civilization* has been—and is still being—destroyed by looting and bombing (Berg & Woodville, 2004).[172] Ironically, the Zarathustrian polarity of light and darkness and its association with good and evil can be observed in a regressive dualistic form, in the subtext of this situation.

---

[172] The US Government has recently donated $100,000 to the funding of a new database being developed by the World Monuments Fund—in cooperation with the Getty Conservation Institute and UNESCO—to conserve and document Iraqi archaeological sites (Berg & Woodville, 2004). Thankfully, *Eridu* is one of the sites included in this program.

6. Myth and the Flourishing of Civilization: The *Noospheric* Journey of the Soul

> The soul had formerly felt as if it were within the phenomena of nature. What it experienced in these natural phenomena . . . presents itself to the soul in the form of images that appeared in vivid reality. (Steiner, 1914/1973c, p. 30)

> Whereas the distinguishing characteristic of the magic structure was the emergent awareness of nature, the essential characteristic of the mythical structure is the emergent awareness of soul. (Gebser, 1949/1985, p. 61)

> The original, primal tribes had to find a way to transcend their *isolated* tribal kinship lineages . . . and mythology, not magic, provided the key for this new transcendence. (Wilber, 2000d, p. 175-176)

Context for Emergence of Civilization

As the transition from magic to mythical consciousness reached its climax, the cultural shift took place from increasingly settled and complex agricultural villages to what are regarded as the world's first cities. The beginning of the third millennium BCE saw a major flourishing of cultural change and development across many regions of the planet. Archaeologically, the period to be considered here straddles the Bronze Age (3,500-1,200 BCE) and the Iron Age (1,200-700 BCE).

Gebser generally locates the emergence and development of the mythic structure of consciousness across this span (c. 3,000-800 BCE). Synchronously, this is almost identical to the timing of Steiner's third cultural period—the Egypto-Chaldean (c. 3,000-750 BCE). Wilber divides his myth-membership period into two: his low myth-membership period (c. 9,500-4,500 BCE) and his high myth-membership period[173] (c. 4,500-1,500 BCE) (Wilber, 1996, p. 110). The three narratives all point to the Bronze and Iron Age periods—though not naming them as such—as being highly significant in the development of a new movement of consciousness and cultural flourishing, with particularly strong convergence between Steiner's and Gebser's time-lines. Notably Wilber's low-egoic period (2,500-500 BCE) also overlaps with this time-frame.

Teilhard de Chardin (1959/2004) also spoke of the significance of this period where settlements were being turned into cities. He claimed that this *socialization*, forced the pace of *hominization*,[174]—leading to a leap of development. He saw it as an important stage in the development of the noosphere—"the envelope of thinking substance" (p. 151). He described how these processes facilitated the subtle consolidation of the noosphere.

---

[173] Wilber's high myth-membership period is more aligned to Steiner's first and second post-glacial cultural periods.

[174] Teilhard links *hominization* with the emergence of the noosphere—during which time "the earth 'gets a new skin'" (Teilhard de Chardin, 1959/2002, p. 183). The noosphere then develops through *socialization*—as discussed above—and the later, *planetization*, which he saw as beginning to emerge in his times and will be discussed later in the paper. (See Appendix B for more information).

> Between them exchanges increased in the commerce of objects and the transmission of ideas. Traditions became organized and a collective memory was developed. Slender and granular as this first membrane might be, the noosphere there and then began to close in upon itself—and to encircle the earth. (p. 206)

Wilber (2000d) makes the significant point that the creation of cultural myths—through a type of primal creativity—enhanced this development.

> The *original* breakthrough creativity—that allowed humans to rise above a given nature and begin building a noosphere, the very process of which would bring Heaven down to Earth and exalt the Earth to Heaven . . . and mythology, not magic, provided the key for this new transcendence. (p. 175-176)

A major cultural flourishing occurred in North Africa and the Middle East among the Chaldean, Babylonian, Assyrian and Egyptian people—the thirty dynasties of the high culture of dynastic Egypt spanned 2,400 years of this period (c. 3,000-600 BCE) (Shaw, 2000, pp. 479-483). However, synchronous cultural flowering also occurred in other regions as Teilhard de Chardin (1959/2002) noted:

> From Neolithic times onwards the influence of psychical factors begins to outweigh—and by far—the variations of ever-dwindling somatic factors . . . with Post-Neolithic man . . . the basin of the Yellow River, with Chinese civilization; the valleys of the Ganges and the Indus, with Indian civilization, and lastly the Nile Valley and Mesopotamia with Egyptian and Sumerian civilization.[175] (pp. 208-210)

Teilhard de Chardin also noted later developments in Central America, and the South Pacific. Recent archaeological discoveries suggest other earlier civilization by the Inkas, in South America.[176]

Terminology Issues

Gebser has foregrounded the term *mythical* to denote this structure of consciousness, while Wilber has foregrounded the term *membership* and added *myth* to it to honor Gebser's terminology. In Wilber's *myth-membership* stage—that he often calls simply *membership*—he focuses quite strongly on sociological and psychoanalytic features. Gebser's focus is more phenomenological, based on extensive research of artistic and literary artifacts. Steiner referred to the period in which the mythic picture consciousness developed as the Egypto-Chaldean period, in reference to the significant developments in culture and consciousness that occurred in those regions. A major divergence occurs regarding the different usages of the term "soul," as discussed below.

---

[175] Teilhard de Chardin (1959/2002) also makes the interesting point that of these three major civilizations "the contest for the future of the world" was won by the more western zones of the Euphrates, the Nile and the Mediterranean (p. 211). He explains this in terms of China's lack of inclination and impetus for change, having—until recently—represented a "scarcely changed fragment of the world as it could have been ten thousand years ago . . . like the writing which betrays the fact so ingeniously" (p. 210). He also points to India—"the region *par excellence* of high philosophic and religious pressures"—having become lost in *metaphysics* . . . and although "ventilating and illuminating the atmosphere of mankind . . . with their excessive passivity and detachment, they were incapable of building the world" (p. 211). This reflects a rather competitive, strongly Eurocentric view of cultural differences, perhaps reflective of his cultural context.

[176] Recent archaeological discoveries at Caral in the Sepe Valley in Peru suggest that some pyramid shaped buildings and settlements of the Inka civilization may have been built as early as 2,500 BCE. http://archaeology.about.com/od/ancientwriting/a/caralquipu.htm

Key Features of Mythic Consciousness

Most of these key features are identified in all three narratives.

- The emergent awareness of the inward-turned world of the soul;
- The development of complex mythology, requiring imagination and a new degree of cognitive coherence;
- The development of astronomy, calendars and other complex mathematical systems;
- A new relationship to death and burial;
- The development of language systems including the first pictographic and logographic writing systems (See Appendix C for more details);
- The strengthening of a sense of cyclical temporality (See Appendix A);
- Membership of large organized social groupings, resembling cities.[177]
- Temple structures, especially pyramids. Although Egypt is most renowned for pyramids, this was also the primary form of temple architecture of Meso-American and South American Inkan civilization;
- The culmination of primarily matriarchal societies prior to the beginnings of patriarchy with the Greco-Roman civilization (Eisler, 2001).

I will now focus in a little more depth on the first four of the above features. The fifth and sixth are discussed in appendices and the remaining features must remain unexamined until subsequent research can be undertaken.

The Inward-Turned World of Soul

Both Gebser and Steiner connected the emergence of mythical consciousness with the first awakening of the individual human soul from its magical enmeshment with nature and cosmos. Gebser—who pays particular attention to artistic detail—notices the gradual extrication of the human form from its natural surroundings. In an exemplary painting of a human figure in nature from Knossos (Crete) dating from the second millennium BCE, Gebser (1949/1985) notes the "placing [of] the upper torso against the "sky" [and that] the sky is simultaneous with the soul" (pp. 61-62). He supports this with Plato's statement "the soul . . . [came into being] simultaneously with the sky" (p. 45). Steiner's conception of soul is based on a Platonic tripartite understanding of the human as having body, soul and spirit—the *soul*[178] as mediator between *body* and *spirit*. He also regarded the period from 3,000 BCE as being significant for the development of the earliest emergence of the human soul—that he called the *sentient* or *feeling soul*.[179]

---

[177] This is a strong emphasis in Wilber's characterization of the myth-membership period, thus he is a valuable source of further information (Wilber, 1996c, p. 97). He also emphasizes sociological issues, particularly in relation to changing gender roles and relationships, including the impact of agricultural surplus on the development of new, more specialized, social roles, e.g., priests, administrators, educators (p. 102).

By contrast, Wilber's notion of soul is somewhat differently placed. He does not use the term soul until after all the structures of consciousness up to ego-mental are established, regarding *soul* and *spirit* as part of what he calls the "superconsciousness" in *Up from Eden* (Wilber, 1996c, p. 11). This conception also appears in his later works, where he does not use the term soul until the post-rational stages beyond vision-logic (Wilber, 2000b, p. 258, n. 22). However, Wilber's use of the term *mind*, when he is referring to body, life, mind, soul, and spirit would appear to be similar to Steiner's and Gebser's use of *soul* in the present context. Gebser's (1949/1985) position is that mythic consciousness paradoxically involves both an "inward-directed contemplation," involving a new awareness of one's own soul; and an outward-directed verbalization, through creating a myth about what has been inwardly visualized. This describes a circular motion of the "internal world of the soul; its symbol is the circle, the age-old symbol of the soul." (p. 66) This internalization of soul enables an "internalization of memory," as recollection, "in parallel with an externalization of utterance," particularly through poetry[180] as inspired by the Muses (p. 192). Perhaps the composite term mind-soul could be an appropriate improvement in the taxonomy.

The World of Myth Through Imagination

For Gebser the movement from magic to mythical consciousness involves a shift from a more vital centre to a soul centre that bears the stamp of the imagination. This aligns with Steiner's position on the major developmental shift from the vital and emotional bodily systems being developed during the first and second cultural periods, and the third cultural period where the inner life of what he called the *sentient soul* was arising. He associated the latter with a sense-oriented, participatory, pictorial type of thinking that developed during the two thousand years prior to the emergence of abstract intellectual thought. Wilber (1996c) is somewhat more pragmatic about these developments. In this period he refers to the significance of language, through which "the verbal mind could differentiate itself out of the previous bodyself" (p. 99). He also pointed to the role of symbolic thinking in myth-making "through a network of intersubjective membership and communication" (p. 101).

---

[178] Steiner drew attention to significant historical-cultural changes whereby a new Church dogma—introduced at the Fourth Council of Constantinople in 869 CE—replaced the traditional Greek philosophical notions of the human being as being composed of body, soul and spirit with a reduced conception of human nature as a duality of body and soul, effectively banishing *spirit* from the map. (Steiner, 1932/1966c, pp. 41-42).

[179] While Steiner claimed that the first two previous cultural periods had enabled the development and consolidation of the vital and emotional bodily systems, he claimed that the third, fourth and fifth cultural periods consolidated three soul developments: the sentient soul, during the mythic period; the rational-intellectual soul, during the Greco-Roman period; and the consciousness-spiritual soul which has been emerging since the 15th century and, arguably, now appearing as what I am calling postformal-integral-planetary consciousness (Steiner, 1930/1983a, 1971a). Steiner also pointed to three future cultural periods where further movements of consciousness would be possible. This aligns with Wilber's model of higher stages of development. However, this theme requires further research.

[180] This more creative poetry of the mythic period, inspired by the Muses, marks a further development of the process of rhythmical recitation of sacred poetry texts—created by the initiates during the magic period as an aid to the development of memory.

While, from Gebser's (1949/1985) perspective, the magic mode is dominated by impulse, instinct and affective reactions such as sympathy and antipathy, the mythical structure has a more mental orientation.

> Latent predisposition to perspectivity, has an imaginatory consciousness, related in the imagistic nature of myth and responsive to the soul and sky of the ancient cosmos. . . . The great cosmogonical images in the early myths are the soul's recollection of the world's origination. (p. 67)

In a similar vein, Steiner (1986a) noted the link between the awakening human soul and the world soul—or *anima mundi*—through the imagination, whereby the cosmos is still experienced as being ensouled.

> The ancient Chaldean priests . . . were the custodians of profound wisdom, but for them these laws of nature were not merely abstract, nor were the stars merely physical globes. They looked on each planet as ensouled by a Being . . . a divine Being who gave it life. Thus the Egyptians and Chaldeans discerned that they were spirits living among spirits in a world of spirits. (p.101)

It is interesting that there is a renewed interest today in notions of *anima mundi*—or ensouled cosmos—among transpersonal psychologists and integral philosophers (Sardello, 1995; Tarnas, 2006). Perhaps it is an indicator of a shift beyond the marginalizing of the inner life that has occurred through the scientific privileging of the measurable world of externalities.

The Development of Astronomy and Calendars

The ancient Sumerians were renowned for their mathematics and early calendars. Steiner suggested that the Sumerians and Babylonians had deep mathematical insights into the relationships between human and cosmic proportions (Steiner, 1982c, p. 73). Gebser and Steiner both noted the awareness of the soul's polarity in the earlier Persian/Sumerian cultures and its parallel—the awareness of the sky, as a counterpole to the earth. Gebser also noted the centrality of polarity in the Chinese *T'ai-Ki* symbol—generally known as the Yin/Yang symbol (Gebser, 1949/1985, p. 220). Steiner (1986a) indicated that the Persians' awareness of the earth/sky polarity laid the ground for the deeper understanding of the Egyptians and Chaldeans who began to uncover the laws that were operating *between* the earth and sky.

> [Humans] looked up to the stars and observed their movements and their influence on human life, and accordingly worked out a science which enabled them to understand these movements and influences. They brought the Heavens into connection with the Earth. (pp. 100-101)

It has been claimed that the Egyptian sciences were based on the legendary wisdom teachings of *Hermes Trismegistus*[181] who is reputed to have written *The Emerald Tablet*, a document on which the Hermetic sciences were based for thousands of years. Sir Isaac Newton[182] has actually translated, with commentary, The Emerald Tablet—often encapsulated in the phrase—*as above, so below*.

A New Relationship to Death and Burial

One of the intriguing aspects of the Egyptian civilization was its relationship to death. Recent research in Sudan suggests that elaborate burial rituals were already operating in the earlier Nubian kingdom from at least 3,800 BCE (Gatto, 2004). However, the Egyptians certainly took these customs to new heights. Wilber, drawing on Joseph Campbell's research, refers to these customs—the mortuary cults, the mummies, the golden death masks—as being "heightened searches for symbolic or token or pretend immortalities" in response to the new "death-fear," arising from their gradually dawning sense of individuality (Wilber, 1996c, p. 121). Steiner, on the other hand, makes quite a different interpretation for the death interest of the Egyptians. Referring to the Osiris-Isis myth, Steiner claimed:

> The Egyptians desired in this way to turn their gaze to that element in the human soul which lives not only between birth and death . . . in their preservation of mummies, in their peculiar death-ceremonies—[they] turned the eye of the soul to that . . . eternal imperishable element . . . united in the Egyptian consciousness with the name of Osiris. (Steiner, 1971a, pp. 2-3)

Gebser (1949/1985) took this point further referring to the life and death poles of the soul. He observed that "the great Egyptian literature on death is an endeavor to master the death region of the soul" (p. 223). The increased focus on death and burial rituals and symbols has been much studied by cultural anthropologists (Barnard & Spencer, 1998). Although the elaborate Egyptian tombs are of great contemporary interest, it is worth noting that one of the most significant of the Egyptian myths—the Osiris myth—is not just about death, but also about resurrection (Campbell, 1993; Neumann, 1954/1995; Steiner, 1971b).

---

[181] *Hermes Trismegistus* was a legendary Egyptian leader who is believed to have developed the Hermetic sciences—which could be called the first spiritual sciences—on which were based alchemy, astronomy, astrology. It is recently being rediscovered that scientists such as Johannes Kepler and Isaac Newton studied Hermetic sciences such as alchemy and astrology.

[182] Although Sir Isaac Newton is considered to be one of the fathers of modern science, his relationship with the Hermetic sciences, linked to ancient Egypt has been a well-kept secret. Like the marginalized writings of Johannes Kepler (See Appendix B), and Charles Darwin, that are being brought to light by integrally oriented evolutionary theorists (Conway Morris, 2007; Loye, 1998; Richards, 1992, 2002), Newton's little known works on astrology and alchemy are currently being catalogued as part of the *Newton Project* at Sussex University in the UK. See also B.J.T. Dobbs, "Newton's *Commentary* on *The Emerald Tablet* of Hermes Trismegistus: its scientific and theological significance", in Merkel and Debus, *Hermeticism*, 182-91. http://www.newtonproject.sussex.ac.uk/prism.php?id=90

Deficient Manifestations of Mythic Consciousness

As mentioned earlier, Wilber (1996c) has a keen interest in debunking the romantic myths about the glories of the past. He reminds us that all was not romance and glory in this early period of civilization building. He describes some of the horrendous rituals that were part of the mythic cultures, including human sacrifice (p. 125). He also pointed to the darker side of the politics of "divine kingship" during the myth-membership period, during which new horrors arose, such as "slavery . . . exploitation . . . elitist class distinctions . . . And massive oppression of the many by the few (p. 178).

Gebser refers to the efficient form of the mythic consciousness when it was at its peak of development and full creative force was engaged to envision a primal image. He notes that as this primordial myth gets passed on it begins to lose its power and to fragment into a multitude of spoken myths. These myths—which passed on over time—are mere echoes of the original primordial visions. He sees this as the deficient phase of mythic consciousness.

This seems analogous to what often happens between the original inspiration of a new philosophy, great leader or spiritual teacher and what becomes of the later product of his or her inspiration. Invariably the original message—whether it is Buddhism, Islam, Christianity, Steiner education, or integral theory—has the purity and power of an inspired vision or mission. Over time, the students or practitioners reduce the original message and develop a mythic version of it. This then becomes ossified into a new dogma as deficient mythic consciousness tightens its stranglehold.

Summary and Relevance for Today

The power of myths is well known to the creators of mass media, and corporate marketing and advertising (Jenson, 1996; Klein, 2000). The suppression of healthy imagination that has come in the wake of centuries of dominance by increasingly narrow forms of rationality has created an imbalance—particularly observable in the images of the future of young people (Eckersley, 2002; Gidley, 1998c, 2002a; Giroux, 2003; Hicks, 2002; Hutchinson, 2002; Inayatullah, 2002; Novaky, 2000). Young people also feel that there is a spiritual vacuum in our society (Gidley, 2005a; Tacey, 2003) which many critical educational theorists and educational futurists argue is too often filled by negative and exploitative media images (Clouder, Jenkinson, & Large, 2000; Gidley, 2001d; Giroux, 2003; Healy, 1998; Hutchinson, 1994; Livingstone, 1998; Milojevic, 2005b; Pearce, 1992; Steinberg & Kincheloe, 2004). When imaginative mythic consciousness is not given scope for healthy expression, it is likely to break through in unhealthy ways, as Gebser has demonstrated.

> Whenever we encounter an immoderate emphasis on the imagistic, the ambivalent, the psychic—an unbridled phantasy, imagination or power of fancy—we may conclude the presence of a deficient mythical attitude that threatens the whole or integrality. (Gebser, 1949/1985, p. 154)

This is exemplified in our mass media today, where extreme levels of violent imagery exemplify deficient mythic consciousness, representing an extremely troublesome form of enculturation of our youth worldwide (Gidley, 2004c; Grossman, 2000; Grossman, Degaetano, & Grossman, 1999; Healy, 1998). Another predatory phenomenon relevant to the enculturation of youth via the appeal of the mythic imagination is cults. By contrast the power of the imagination can be used to enact positive enculturation, if the creative imagination is harnessed to the virtues of the Good, the Beautiful and the True. Educators, futurists, integral theorists, and some philosophers have begun to highlight the importance of rescuing healthy, positive, grounded imaginative-thinking from the limitations of a rationality too narrowly-defined, as will be discussed in the next section. The significant role of the healthy development of the imagination in educating for postformal, integral consciousness has been discussed elsewhere (Gidley, 2007a).

Transition from Mythical to Mental Consciousness—A Second Complex Aporia

As individual egos began to break through and awaken, in parallel with the next movement of consciousness, the ancient wisdom that had lingered in the mythic imagination began to grow dim.

> In myth the picture was experienced in such a way that one felt it to be in the external world as a reality. One experienced this reality at the same time, and one was united with it. With thought . . . [we] felt [ourselves] separated from nature. (Steiner, 1914/1973c, p. 16)

In addition, what was held in balance to a degree within the mythic sense of polarity became torn apart with mental dualism:

> Duality is the mental splitting and tearing apart of polarity, and, from the correspondences of polarity, duality abstracts and quantifies the oppositions of antitheses. (Gebser, 1949/1985, p. 86)

There may be a need to clarify a potentially confusing, apparent timing contradiction with regard to the transition in northern Europe from mythical to intellectual-mental-rational consciousness—and subsequently to the beginnings of integral-planetary consciousness. According to Gebser, these two transitions occurred within a few centuries of each other (13th to 16th centuries). I will use Gebser's clarification of these issues as my guide. This is because he has provided extensive phenomenological detail on these periods in relation to his structures of consciousness, which I have foregrounded in my analysis. Steiner's view of these transitions is closely aligned.[183] Wilber's view is somewhat more contradictory and will be discussed in more detail below.

---

[183] From my substantial research across dozens of Steiner lectures/volumes—aimed at locating and cohering his numerous statements on these matters—I am satisfied that his views were very closely aligned to Gebser's research on these European transitions (see reference list for major sources). This is not withstanding the possibility that a researcher with greater Steiner expertise than I have may point to Steiner documents at variance with my claim, given the sheer volume of his work on the evolution of culture and consciousness, some of which is not yet available in English.

In order to bring clarity, I will explicate three transitional situations discussed in the narratives. The descriptions that follow are not intended to present these transitions as if they were immutable fixed structures that were compelled to occur at these times. Rather my purpose is to tease out a rather complex series of steps in the narratives.

1. In addition to claims in this narrative there is a general consensus in the history of Western ideas that a major transition began around 500-800 BCE from mythical consciousness to intellectual-mental-rational consciousness—primarily in Greece and later in ancient Rome (Gangadean, 2006a; Habermas, 1979; Jaynes, 1976; Tarnas, 1991, 2006). The present narratives point to prior influences from surrounding regions such as Egypt, and Mesopotamia. Gebser notes:

> This new conscious structure began to be evident when the consolidation of myth reached its height in the eighth century [BCE] the definite and full awareness of the new mutation expressed in the consciousness structure then new was fully effected in Plato. The two millennia, which followed, were devoted to consolidating the new consciousness, a process completed by 1480-1500 [CE, with] Leonardo's perfection of perspective. (p. 303)

While Steiner and Gebser are in agreement on this, there is contradictory material in Wilber's writings. In *Up from Eden*, Wilber refers to the latter phase of the myth-membership as ending around 1,500 BCE, and in addition he refers to the *egoic-stage* as having three sub-stages: "the low: 2500-500 [BCE]; middle: 500-1500 [BCE]; high: 1500 [CE] – present" (Wilber, 1996c, p. 188). Wilber's evidence for this is that Joseph Campbell claims that *the Hero myths* emerged approximately 2,500 BCE—the beginning of Wilber's *low egoic* period. However, in Wilber's second edition of *SES*,[184] (Wilber, 2000d), he agrees with Gebser (and Habermas) that the egoic-rational emerged "in the middle of the first millennium BCE, but it reaches its fruition with the rise of the modern state, roughly the sixteenth century in Europe" (p. 184).

2. The second transition—still within the mythic-to-mental transition itself—concerns the belated development of mental-rational consciousness in northern Europe—compared with Greece and Rome. Gebser claimed that the mythic consciousness had continued to operate in most of northern Europe for a much longer period of time than in southern Europe. Gebser (1949/1985) describes this situation as follows:

> We must also remember a fundamental fact, namely, that the events of 500 [BCE] in Greece had to be repeated around 1250 [CE] by European [humans]; and [their] basis was considerably broadened because of three major achievements, all containing an element of incipient perspectivality: the Greek theory of knowledge, the Hebrew doctrine of salvation, and Roman legal and political theory. . . . This European perspectival-rational world represents, in this sense, only the deficient and most likely untimely phase of the exclusive validity of the mental-rational structure. (p. 74)

In Gebser's view, the apparent increasing intellectualism in Europe after this time, particularly throughout the European Enlightenment and beyond, was an overextension of the deficient rational,[185] which in turn—Gebser (1949/1985) posits—is leading to its own demise. In one of the most polemical statements that I have seen in Gebser's writing, he speaks of the dangers of the overextension of deficient forms of rationality.

---

[184] *SES* stands for *Sex, Ecology, Spirituality*—the title of Wilber's most voluminous book.

> The suicide of Western civilization . . . the consequence of the destruction of man's inner being by the self-destruction of the divine in man, and by his rational denial of all the irrational and pre-rational aspects, by which he dispossessed himself of his own foundations (p. 357).

Wilber appears to be in agreement with this position, characterizing the European Enlightenment as being the peak of the development of rationality, and noting that in spite of its great contributions, this period also marked the beginning of its decline (Wilber, 2000d).

3. The third European transition—from Gebser's mental-rational to his integral-aperspectival consciousness, beginning in the 15th century BCE—will be discussed at the end of the next major section of the narrative.

---

[185] Gebser's notion of the *deficient rational* will be discussed in the next section. It is however related to his notion that each new structure of consciousness has a cycle of emergence, consolidation and decline.

7. The Awakening Ego-Mentality: The Birth of Western Philosophy

> Thought life is born in man at a definite time. It causes the extinction of the previous form of consciousness in which the world is experienced in pictures. (Steiner, 1914/1973c, p. 14)

> The irruption of the mental structure . . . it divides and thus destroys the *image* of the world, which is replaced by a *conception* of the world. (Gebser, 1949/1985, p. 176)

> Cognitive psychologists and anthropologists tend to use rationality to mean "formal operational cognition."[186] (Wilber, 2000d, p. 179)

Context for Emergence of Ego-Mentality

Between 700-800 BCE another major transformation of consciousness began to take place, with its most explicit and most articulated expression in Athenian Greece. From a formal academic perspective, this is the beginning of classical history in the west when literate cultures began to record their own histories.[187] (For more detail see Appendix A.) Contemporary philosopher and cultural historian Tarnas concurs with this perspective (Tarnas, 1991, pp. 16-19). Historian of consciousness Jaynes (1976) also emphasized the significance of the Greek culture in enabling this movement of consciousness.

> The Greek subjective conscious mind, quite apart from its pseudostructure of soul, has been born out of song and poetry. From here it moves out into its own history, into the narratizing introspections of a Socrates and the specialized classifications and analyses of an Aristotle, and from there into Hebrew, Alexandrian and Roman thought. And then into the history of a world, which, because of it, will never be the same again. (p. 292)

Steiner, Gebser and Wilber identified the birth of western philosophy in ancient Greece as a turning point between mythical consciousness and mental-rational consciousness, as discussed. Steiner also referred to the period that began there as the fourth [post-glacial] cultural period—or the Greco-Roman period—beginning in Southern Europe and Western Asia approximately 750 BCE and developing over the next two millennia (Steiner, 1971a).

Although from a western perspective Greece is almost universally credited with the development of philosophy *per se*, this is a Eurocentric stance. Several perspectives need to be considered. Firstly, Steiner pointed out that, unlike the later time of Imperial Roman domination, early Greece was a very cosmopolitan region where "human beings of the most varied regions of the ancient world had gathered" and carried the ancient mystery wisdom on through Asia Minor, Greece and Italy, reshaping it into concepts and ideas through the emergence of western philosophy (Steiner, 1910/1939, p. 210). Secondly, in China and India, major philosophical developments indicating a shift in consciousness were also occurring during this period. Gebser (1949/1985) noted that, in China, the *I Ching* was revised from a book of oracles in use through the magic and mythical periods, into "mankind's oldest book of wisdom" around 1,000 BCE, reflecting the beginnings of wakeful, mental consciousness" (p. 314). Also from at least the 6th century BCE—the time of Lao Tse (580-500 BCE) and Confucius (551-479 BCE) until 221 BCE when the first empire began, there was an era of great cultural and intellectual expansion, known as the *Golden Age*[188] of Chinese philosophy. In India, as demonstrated previously, very advanced spiritual-philosophical systems of thought existed in earlier times which, by the 8th century BCE, were beginning to address such philosophical matters as the relationship between wealth and immortality—matters not examined by Aristotle until several centuries later in his *Nicomachean Ethics* (Sen, 1999, pp. 13-14). The Indian texts were not written down, however, until c. 300 BCE. Unfortunately, we still have little knowledge or understanding of the developments that may have been occurring in Meso- and South America. (For more information on the latter see Appendix C).

---

[186] Wilber is referring to Piaget's *formal operations*.

[187] There is at least a century-old philosophical critique of this perspective on history, most notably from Nietzsche, Steiner and Foucault. Teilhard de Chardin also critiqued the notion of dividing up History and pre-History on the basis of whether or not we possess written or dated documents, claiming that "there is no breach of continuity between the two" (Teilhard de Chardin, 1959/2002, pp. 206-207).

Terminology Issues

For the movement of consciousness that arose in that period, Steiner primarily used the term *intellectual soul*. Gebser (1949/1985) invoked the term *mental* for his parallel structure of consciousness with its semiotically diverse roots. He notes that the Greek *menos*, the Latin *menis*, the English *man*, and the German *Mensch* all derive from the Sanskrit root *ma-* with one of its secondary roots being man. "From the root *man-* comes the Sanskrit word *manas*, which can refer to "inner sense, spirit, soul, understanding, courage, anger . . . and *Manu*"[189] (p. 76). He regards this as a richer characterization than the term *rational*, from *ratio*, which is related to calculation and division. He notes that *rationality's* "directedness and perspectivity" is towards the notions "to reckon", "to calculate," "together with—unavoidably—sectorial partitioning" rather than the direction towards the ability to "think" and "understand" (p. 74). He used the term *rationality* primarily to characterize the *deficient* mental consciousness because of its partiality and tendency to quantification. Gebser appears to equate the term *intellectual*—though he rarely uses it—with the mental structure (p. 377) and *intellectualism* with its more deficient counterpart, *rationality* (p. 436). Wilber's terminology for this stage appears to have undergone a transition: in his earlier works his usage was more aligned to Gebser's, where he frequently used the term *mental-egoic* to refer to this stage and *rationalism* to refer to the "dehumanization of man" associated with the European Enlightenment (Wilber, 1996b, 1996c). In his later works he uses the term *mental* in a more general sense—as the adjective for mind—and favors the terms *rationality* or *egoic-rational* for the post-mythic stage (Wilber, 2000b, 2000d, 2006). He acknowledges that his later focus is more on the type of rationality that reached its fruition in sixteenth century Europe, whereas Steiner and Gebser spread their interpretive attention across the two millennia starting with Athenian Greece. Because Steiner favored the term *intellectual*, Gebser favored the term *mental*, and Wilber currently favors the term *rational,* for this mode of consciousness, I mostly use the hyphenated[190] term *intellectual-mental-rational* for this movement of consciousness.

---

[188] Reference to China's Golden Age came from a course on Philosophy and Religion in China at the City University of New York. http://academic.brooklyn.cuny.edu/core9/phalsall/texts/chinrelg.html

[189] The latter point about the linguistic roots of *Manu*, is consistent with Steiner's narrative on *Manu,* discussed earlier.

Key Features of Intellectual-Mental-Rational Consciousness

Because of the temporal and spatial convergence of various events, this new consciousness became hybridized with several other characteristics:

- The awakening of the independent ego, or individualism—the heroes;
- The birth of rational philosophy in Greece, through Thales, Socrates, Plato, Aristotle;
- The inner-directness towards self-knowledge;
- The beginnings of the Axial age with the birth of several major religions;[191]
- The shift from picture-based writing to the more abstract writing using the Greek alphabet (See Appendix C);
- Beginnings of formal mathematics with Pythagoras;
- The development of the world's first democratic city-state in Athens in 500 BCE, followed by the formalization of politics and legislation;
- The origins of formal education in the 4th century BCE with Plato's *Academy* and Aristotle's *Lyceum* sowing the first seeds of higher education.

Because the narrative is now dealing with the period of formal history, there is voluminous material that could be referred to for each of the points above, but it is beyond the scope of this narrative to cover this in detail. I will focus on the first four features, as these are significant in all three narratives. The abstraction of writing is indicated briefly in Appendix C. The mathematical, political and educational developments could be seen as broader contexts for the consciousness shift.

The Awakening of the Independent Ego

Wilber makes a significant contribution, which could not have been made in Steiner's or Gebser's work, both of which pre-dated much of contemporary psychology and critical social theory. In fact, this is one of the places where Wilber (1996c) seems to dive deeper than usual—in his elucidation of ego development in relation to consciousness. Perhaps this is because—as he correctly notes—the meaning of the term *ego* is wildly contentious today. He characterizes mental-egoic consciousness in the following way.

> It marked a transcendence over the dimly conscious, still somewhat prepersonal, mythic, and diffuse structure of the membership stage. It opened up the possibility of truly rational and logical thought . . . the thought processes themselves start to become objects of

---

[190] By using the compound hyphenated term *intellectual-mental-rational* I am drawing on the postformal philosophy of complex thinking developed by Morin. He often uses such compound terms to denote complex integration of concepts (Morin, 2005a, 2005b).

[191] Two other major religions—Hinduism and Judaism—originated over a thousand years prior to the Axial Age. Others will also be discussed below.

> awareness . . . which eventually results in "formal operational thinking," or logic, as Piaget showed (p. 189).[192]

He (Wilber, 2000d) draws attention to the many uses of the term *ego* in contemporary discourses, identifying the following perspectives:

- The "New Age" notion of ego as "separate self sense, isolated from others and from a spiritual Ground" (p. 236);
- The contemporary psychoanalytic notion—based on Freud—of the ego as being "the principle that gives unity to the mind . . . a fundamental organizing pattern" (p. 236);
- The philosophical distinction between "the empirical ego, which is the self insofar as it can be an object of awareness and introspection, and the Pure Ego or transcendental Ego (Kant, Fichte, Husserl), which is pure subjectivity (or the observing Self), which can never be seen as an object of any sort. . . . [whereby] according to such philosophers as Fichte, this pure Ego is one with absolute Spirit . . ." (p. 236);
- Somewhat paradoxically, Wilber contrasts the Piagetian sense of *egocentric*—an early stage, before the *ego* as "self" or "subject" has differentiated itself from the world—with the *mature ego stage*, which enables formal operations (p. 237);
- The Habermasian "ego identity, a fully separated-individuated sense of self" (p. 238).

Wilber (2000d) then concludes that he most often uses the term ego similarly to Freud, Piaget and Habermas, "a rational individuated sense of self, differentiated from the external world, from its social roles (and the superego) and from its internal nature (id) (p. 238).

Steiner's usage of the terms *Ego* or *I* also appears to integrate aspects of the psychoanalytic *organizing principle*, the Piagetian *mature ego*, and the Habermasian *ego-identity*, but with the understanding that its intrinsic nature is divine in the Fichtean *Pure Ego* or *Higher Self* sense. Wilber's New Age description would equate with Steiner's term *egotism*. Gebser's (1949/1985) usage of the terms *ego* or *I* bear some similarity to Wilber's and Steiner's characterizations. He certainly identifies the centrality of ego awareness as an organizing principle that gives direction to consciousness. "This effector, or agent, the bearer of consciousness, is the ego. With this we are fully in the mental structure, the anthropocentric structure where consciousness becomes centered" (p. 89). Gebser adds that the *core* or *nucleus*—"in all likelihood identical to the presence of origin . . . forms, shapes and directs each and every individual human being" (p. 134). For this *core* he prefers to use the term "the *itself* [which] "can become visible in the reflexivity of the ego without succumbing to the autism of a self" (p. 134). Gebser also appears to use the term *egotism* is a similar way to Steiner.

Finally, all three refer to the significance of the sun mythologeme[193] in relation to the development of the ego during this period. Gebser (1949/1985) notes the sun mythologeme in both China and Greece (pp. 70, 79). Steiner writes extensively on the myths of the early culture periods leading up to—and including—the beginnings of Christianity which point to the relationship between a spiritual notion of the Sun and humanity. Wilber (1996c) discusses in substantial detail what he calls the *solarization of the ego*, in particular in relation to the hero myths (p. 227-251).

---

[192] Wilber seems to be referring here to the third of the three major components of Piaget's *formal operations* which could be summarized as: *hypothetico-deductive reasoning*, *scientific-inductive reasoning* and *reflective abstraction* (Piaget, 1955).

[193] Gebser may have coined the term *mythologeme,* as it has not been possible to find a formal definition of it. Based on the way he uses the term and also other usages of the suffix –eme, e. g.,

The Birth of Philosophy in Greece

Steiner (1971a) pointed to the significant relationship between the awakening individual ego and the new intellectual-mental-rational forms of thought in which mental knowledge came to special prominence—"the time began in which man mainly sought to grasp the world through understanding and this relationship to the world brought him thoughts" (p. 54).

> Thinking gradually passed over to abstractions . . . in the work of Thales, with whom one generally begins the history of philosophy. (p. 25)
> This had to come about since otherwise [humans] could not have attained freedom and a full consciousness of the ego. (p. 19)

Tarnas (1991) points to the significant contribution of particular individuals in this project: "The Greek sense of confidence in the power of human thought to comprehend the world rationally, a confidence begun with Thales, now found in Aristotle its fullest expression and climax" (p. 60). Gangadean (1998), concurs, regarding the significance of individual Greek philosophers, while also pointing to the underlying *universal* nature of what he calls, *first philosophy*. Although perhaps a contested notion in postmodern times, this is a theme that recurs today as we search for *universals* through the *particularities* of the diverse approaches to integral thought.

> And Plato and Aristotle broke new ground historically in inaugurating a formal science of the Universal Logos of natural reason, a birthing of first philosophy. (p. xvii)

Wilber (1996c) refers to two particular aspects of Aristotle's philosophy that reflect the refining of the social arena of the earlier myth-membership self. He summarizes the Greek *polis* in its original idealistic sense, "as being a *shared human community* . . . based on unrestrained *communication* (via language)." Secondly he refers to *praxis*, which in its traditional Aristotelian sense is "purposeful, enlightened, moral behavior pursued in the company of polis" (p. 167). Wilber notes current usages that have reduced and debased *polis* to "politics" and *praxis* to "moralism" or simply "practice" (p. 168).

Gebser points to the struggle of the Greek mind to overcome the vitality and dynamism of the soul. Even in Aristotle's teachings, the soul, is still vital and determined by: "memory, perception, cognition and movement." Gebser (1949/1985) notes "even at the mental inception of Western philosophy the original numinous and dynamic character of the concept of soul is still effective" (p. 197).

---

a *phoneme* is the smallest unit of speech that distinguishes meaning; a *grapheme* is the fundamental unit in written language; I am assuming he is using *mythologeme* to denote the fundamental *unit of mythical meaning* that can be used in various myths.

The Inner-Directedness Towards Self-Knowledge

In what I consider to be a peak of convergence in their writings, Steiner, Gebser and Wilber all point to the significance of the awakening ego in order for the individual to begin the process of self-development. Synchronously, they all identify the consummation of this event, in the famous inscription, *"Know thyself,"* on the temple of Apollo in Delphi. A detailed hermeneutic analysis of the similarities and uniqueness of their comments about this marker of inner-directed mental consciousness are discussed and evaluated in the final section. Gebser (1949/1985) also noted that although up to this point the process of writing had either been from top to bottom—as in Chinese—or from right to left, this inscription brought with it a reversal in the direction of writing. It was written from left to right. Gebser speculated that this was a key marker of the directedness of the individual ego (pp. 75-78).

An extensive hermeneutic examination of the original meaning of this term *gnothi seauton*, "Know thyself" has been undertaken by Foucault and delivered in some of his last lectures (1981-1982)—*The Hermeneutics of the Subject*—at the *Collège de France* (Foucault, 2005). He argues, based on historical and archaeological evidence, that the original meaning and usage of the term by Socrates and many other philosophers of Antiquity, was much more rich and spiritually oriented than contemporary philosophy gives credit for. Foucault refers to the intimate relations between *gnothi seauton* (know yourself) and another significant term *epimeleia heautou* (care of the self) within which our interpretation needs to be contextualized. It is beyond the scope of this article to discuss Foucault's point in depth. However, of relevance to this research is the Greek notion of "care of the self," which Foucault explained as "spirituality," in the sense of disciplined practices of the soul, such as meditation, purification and other transformative practices to prepare oneself to have access to the truth. Foucault (2005) comments,

> So, throughout Antiquity (in the Pythagoreans, Plato, the Stoics, Cynics, Epicureans, and the Neo-Platonists), the philosophical theme (how to have access to the truth?) and the question of spirituality (what transformations in the being of the subject are necessary for access to the truth?) were never separate. (p. 17)

Foucault (2005) added that this code of morality—care of the self—that arose out of Greek philosophy in the 5th century BCE, was further developed over the next thousand years, particularly through Christian spiritual disciplines associated with soul preparation for acquiring knowledge. He then raised the obvious question: "Why did Western thought and philosophy neglect the notion of *epimeleia heautou* (care of the self) in its reconstruction of its own history?" (p. 12) His explanation is that what he called *the Cartesian moment* functioned in two ways, "by philosophically requalifying the *gnothi seauton* (know yourself), and by discrediting the *epimeleia heautou* (care of the self)" (p. 14). He claimed that this was the point where "the history of truth enters its modern period" (p. 17). Based on Foucault's insight, I want to ensure that my macrohistorical narrative does not overlook the separation of our philosophical history from our spirituality. The contemporary need for the reintegration of this split is discussed in the next major section on postformal-integral-planetary consciousness.

The Beginnings of the Axial Age

Another major cultural development was occurring during this period (c. 800 BCE-1,500 CE) throughout the major centers of civilization at the time—Ancient Greece, the Middle East, India and China. Perhaps somewhat paradoxically, in parallel with the development of intellectual-mental-rational consciousness—the most abstract structure of consciousness—several of the world's major religions also began, including the some of the first monotheistic religions. Although Hinduism[194] and Judaism[195]—which could be seen as parent religions to many of the others—had already developed in the previous millennium, there was a flourishing of new religions over the next thousand years. The beginning of this period has been called the *Axial Age* by Karl Jaspers (Erickson, 1999). Wilber (2000d) refers to this phenomenon as the rise of the "rational religions." Gebser (1949/1985) also draws parallels between aspects of the mental structure and the origins of several religions, making the additional link between the emergence of mental thinking and patriarchy.

> In China, Confucius introduces patriarchy only slightly later than Lycurgus in Greece [around 500 BCE]; and . . . in Persia, Zarathustra asserts dualism which . . . underlies Parminedes' notion of a Being opposed to Non-Being. (p. 79-80)

A broader contextualization of the duration of Jasper's Axial Age suggests a longer period of religious emergence that includes even more of the major world religions. In addition to the religions that arose during the six hundred year period that Jasper theorized (800-200 BCE), Hinduism and Judaism, founded in the 2nd millennium BCE, were still extant at that time. If we continue on into the 1st millennium CE, where, according to Steiner, Gebser and Wilber, the intellectual-mental-rational-consciousness continued to grow and spread, then Christianity, Shinto and Islam also arise.

2nd Millennium BCE
- Hinduism in India (2,000 BCE)
- Judaism in Near East (Moses c. 1,300-1,200 BCE)

1st millennium BCE
- Zoroastrianism in Persia (Zoroaster 628-527 BCE)
- Jainism in India (Mahavira 599-527 BCE)
- Taosim in China (Lao Tse 580-500 BCE)
- Buddhism in India (Buddha 563-483 BCE)
- Confucianism in China (Confucius 551-479 BCE)

1st Millennium CE
- Christianity in Near East (Jesus Christ BCE 1-33 CE)
- Shinto in Japan 100 CE
- Islam in Arabia (Mahammad 570-632 CE)

Clearly if we went back even further we would need to take into account Paganism and Animism—which are spiritual movements generally associated with the Upper Paleolithic and

---

[194] Hinduism is generally believed to have begun around 2,000 BCE.
[195] Judaism is linked to the life of Moses c. 1,200-1,300 BCE.

Neolithic periods. While it is beyond the scope of this paper, further research could be undertaken on the relationship between the development of world religions and the evolution of consciousness (Benedikter, 2005; Bouma, 2006; Clayton, 2006, 2007; Clayton & Simpson, 2006; Esbjörn-Hargens & Wilber, 2006; Tacey, 2003; Wilber, 2006). It is worth noting that the religions of India and China also began as integrated spiritual-philosophical systems,[196] much as the Greek and early Christian spiritual-philosophical systems began, according to Foucault, as discussed above. This *formative* complementarity of philosophical knowledge and spiritual self-care only became a *deformative*[197] split in Europe with the *Cartesian moment* as Foucault indicated. It might be fruitful to consider whether a similar split has also occurred between Indian philosophies and religions or those of Chinese origins.[198]

It is also interesting to note that throughout this two thousand year period of development of ego-based thinking, the emergence of these religions provided several *spiritual punctuations*. I will briefly refer to three that have each introduced into the world in a unique way the teachings, power and message of Love and/or Compassion perhaps as a counter-weight to the increasing dominance of head-knowledge. I will attempt to interpret them *according to their own traditions*: the Buddha, according to a common reading of Buddhist philosophy, represented the highest development that a human being could reach—spiritual enlightenment, and in the last stages of his *ascent* he modeled and taught Wisdom and Compassion; the Christ, according to a common reading of Christian theology, represented an embodiment of the Divine, descended from Heaven/Cosmos/Sun,[199] and in the last stages of his *descent* he modeled, taught and embodied Wisdom and Love; the Prophet Muhammad, according to a common reading of Islam, represented a messenger of God, "the paradigm of ethical and moral behavior" (Inayatullah & Boxwell, 2003, p. 178) taught and modeled Compassion and Mercy prior to his *ascent*. These messages of love and compassion have become increasingly isolated from the egoic path of knowledge reaching a peak of separation in Kant's differentiation of the knowledge spheres (Wilber, 2000d, p. 401). The emerging need for a reintegration of love-heart with wisdom/head is discussed in the next major section.

Steiner, Gebser and Wilber have all written on the missions of the various religions, and all point to the need for the re-integration of spirituality with the other knowledge domains, but it is beyond the scope of this paper to discuss this topic further. Wilber's most recent book proposes an integral approach to religion as a path to evolving consciousness (Wilber, 2006).

---

[196] For example, some of the original Buddhist texts offer insights into the thinking mind that are at least as enlightening as much contemporary western psychology (Zajonc, 1997). Confucian philosophy formed the basis of the Han Chinese Empire creating "economic, political and cultural unity out of disparate ethnic groups" (Swimme & Tucker, 2006, p. 8) two thousand years ago, prior to the Roman Empire.

[197] The terms *formative* and *deformative* are used by David Boadella—in a similar way to Gebser's use of efficient and deficient, or Wilber's use of healthy and pathological—to discuss the different polar faces of religion and spirituality (Boadella, 1998, pp. 30-31). I find them to be very suitable terms in this context.

[198] If not, this may indicate either that they have remained in a mythic relationship to religion and philosophy, or that they have developed the mental structure of consciousness, but without its subsequent divisive deformation. Of course, even this statement itself is a gross over-simplification. This could be the subject of further research.

[199] While the traditional, exoteric Church Christianity refers to Christ descending to earth from *Heaven*, esoteric Christian traditions, such as Rosicrucianism, anthroposophy, and creation spirituality, connect Christ with the *Sun* mythologeme and/or the *Cosmos* (Fox, 1988).

Deficient Manifestations of Intellectual-Mental-Rational Consciousness

Steiner (1971a) pointed out that this "head and thought" civilization was in some ways more perfect and complete during the Greek period when humans still had a relationship to the surrounding world. "It is only what developed from it as a decadent condition that became materialistic" (p. 55). The beginnings of this decadence was evident as early as 221 BCE in early Imperial China, which went through a destructive, totalizing suppression of diversity similar to that of the Roman Empire a few centuries later. What had blossomed as a cultural flourishing in Greece, contracted with the Roman Empire: the invention of bureaucracy, the rule of law with its sense of righteousness and power, the Romanization of Christianity, and the masculinization of culture, particularly the advancement of war machinery exponentially supporting the desire to conquer, colonize, and convert (Eisler, 1987).

Both Steiner and Gebser emphasize the deficient nature of excessive abstraction. Steiner (1971a) notes "humanity had to go through the period of abstractions . . . But [the abstract ideas] *must* be united again with reality" (p. 31). Gebser (1949/1985) decries the excesses of abstraction: "In its extreme form of exaggerated abstractness, it is ultimately void of any relation to life and becomes autonomous; empty of content and no longer a sign but only a mental denotation, its effect is predominantly destructive" (p. 88). Gebser expands on this notion as follows.

> Today, while the integral is overdetermining and dissolving the mental-rational consciousness, the mental capacity of thought is being mechanized by the robots of calculation—computers—and this is being emptied and quantified. (p. 538)

Wilber (1996c) pointed to the *monumental* price that humans had to pay for the "monumental growth in consciousness" that arose with the ego. He cites Campbell as referring to this period of development as "the great reversal" (p. 305). In Wilber's terms: "The ego, then, lies at the extreme point of vulnerability, half-way between the Eden of the subconscious and the true Heaven of the superconscious" (p. 305). He identifies four major factors that in his view contributed to "a sense of the Fall." These were existential guilt, neurosis, "feelings of alienation . . . from Spirit" and "egoic *hybris* (hubris)" (pp. 306-308).

Summary and Relevance for Today

Gebser (1949/1985) describes how the human ego "emerges and increases from mutation to mutation, culminating in the deficient mental phase with its overemphasis of ego and its pendulation between isolation and rigidification (egocentricity)" (p. 151). He comments:

> Wherever we are caught up in the labyrinthine network of mere concepts, or meet up with a one-sided emphasis on willful or voluntaristic manifestations of attempts at spasmodic synthesis . . . we may assuredly conclude the presence of a deficient mental, that is, an extremely rationalistic source. (Gebser, 1949/1985, p. 154)

Both Steiner (a century ago), and Gebser (fifty years ago), fore-sensed the looming planetary catastrophe if we do not wake up and change our thinking.

> If [we do] not vitalize [our] thoughts, if [we] persist in harboring merely intellectualistic thoughts, dead thoughts, [we] must destroy the earth. . . . The destruction begins with the most highly rarified element . . . ruining . . . the warmth-atmosphere of the Earth. . . . and if [our] thoughts were to remain purely intellectualistic, [we] would poison the air, ruining in the first place, all vegetation. [Eventually, far in the future] it will be possible for [us] to contaminate the water. (Steiner, 1972b, pp. 90-91)

It is somewhat horrific to realize that in the short space of a century, what Steiner predicted might happen over a long period of time—he was speaking of thousands of years—is well underway towards the catastrophe he foreshadowed—most notably "ruining . . . the warmth-atmosphere of the Earth" with global warming. Gebser (Gebser, 1949/1985) also fore-sensed the problems that are arising today.

> The crisis of our times and our world is in a process—at the moment autonomously—of complete transformation, and appears headed toward an event which, in our view can only be described as a "global catastrophe" . . . Either we will be disintegrated and dispersed, or we must resolve and effect integrality. (p. xxvii)

Even two hundred years ago, Hegel's message, as interpreted by Tarnas, seems to portend the impending crisis.

> As Hegel suggested, a civilization cannot become conscious of itself, cannot recognize its own significance until it is so mature that it is approaching its own death. (Tarnas, 1991, p. 445)

Many contemporary scholars also highlight the urgency for the type of change in consciousness that the next section foregrounds (Elgin, 1993; Gangadean, 2006a, 2006b; László, 2006; Montuori, 1999; Morin & Kern, 1999).

Transition from Intellectual-Mental-Rational to Postformal-Integral-Planetary: The Challenge of the Hour

Gebser and Steiner describe this transition as having its birth between the 15th and 16th centuries in Europe, where the new consciousness is struggling to emerge through the complacency of the over-ripe old consciousness structures. Gebser (1949/1985) summarizes this situation.

> When spatial consciousness was finally consolidated around 1480-1500 [CE] it was from that time onward liberated for new tasks. Waking, diurnal consciousness had been secured . . . After this achievement modern European [people] believed that . . . [they] had accomplished all that could be accomplished and [were] content to remain in [this] state of achievement. . . . but . . . a decline sets in because of this self-satisfaction, and, beginning with the Renaissance, mental consciousness increases in deficiency and deteriorates into

> rationalism. . . . At the same time, however, the new mutation begins its course which becomes gradually but increasingly visible over the following centuries [and] . . . will enter the general awareness at the moment when the deficient attitude reaches its maximum of rational chaos—a moment we are reaching with finality during the present decades (p. 303).

In Steiner's (1986a) view, the manner in which modern science developed—at least up to his time—was an overextension of *head*-knowledge to the extent that it was not permeated with *heart*-knowledge. While earlier forms of science which were more in tune—albeit not fully consciously—with the cosmic laws, modern science discovered the workings of these laws of nature "of gravity, of heat, of steam, of electricity" (p. 102) and used them to manipulate the world. Steiner pointed to his times as the turning point where humans, having reached "the highest point of [our] power to transform the physical world. . . . From now onwards [we] will become more spiritual again" (p. 102).

Wilber's position on this transition is less clear. Although he writes substantially on vision-logic—his term for the new consciousness after rationality—he makes few statements regarding its beginnings. There is one direct statement that I have located where he (Wilber, 1996c) notes that "the centaur[200] was first reached by a significant number of individuals with the flowering of humanistic understanding of man, perhaps as early as the 1600's in Europe (Florence, especially) but peaking with present-day humanistic-existential psychology" (p. 340, note*). In his later work Wilber (2000d), draws on Habermas indicating the idea that the collective development of ego-identity in 16th-century Europe, led to concepts of legal, moral, and political freedom. He describes the impact of this development on culture and society, citing Habermas, as facilitating notions of "global forms of intercourse" and early conceptions of *world citizen*ship (p. 191). While this suggests planetary consciousness, Wilber does not explicitly bring this through.

The following section discusses literature on the multi-faceted features of emergent consciousness.

---

[200] Wilber uses the term *centaur* to denote the body-mind integration of vision-logic.

8. Postformal-Integral-Planetary Consciousness—the Emergence of Reintegration

> Let us call what shines forth in the soul as eternal, the *consciousness soul.* . . . The kernel of human consciousness, that is, *the soul within the soul* . . . is then distinguished from the intellectual soul, which is still entangled in the sensation, impulses and passions. . . . Only that truth is permanent, however, that has freed itself from all flavor of such sympathy and antipathy of feeling. . . . That part of the soul in which this truth lives will be called consciousness soul. (Steiner, 1904/1971e, pp. 24-25)

> *Transparency (diaphaneity) is the form of manifestation of the spiritual.* . . . Integral reality is the world's transparency, a perceiving of the world as truth: a mutual perceiving and imparting of truth of the world and of man and all that transluces both." (Gebser, 1949/1985, p. 7)

> As vision-logic begins to emerge, postconventional awareness deepens into fully universal, existential concerns: life and death, authenticity, full bodymind integration, self-actualization, global awareness, holistic embrace . . . In the archaeological journey to the Self, the personal realm's exclusive reign is coming to an end, starting to be peeled off a radiant Spirit, and that universal radiance begins increasingly to shine through, rendering the self more and more transparent. (Wilber, 2000b, p. 105)

Context for Emergence of Postformal-Integral-Planetary[201] Consciousness

Steiner, Gebser, and to a lesser extent Wilber—as discussed previously—refer to the first glimmerings of the emergence of a new movement of consciousness in the cultural phenomena of 15th to 16th century western Europe. For Steiner, the early 15th century marks the beginning of what he calls the fifth [post-glacial] cultural period. Tarnas (2006) agrees that the European Renaissance ushered in a new era. He pinpoints "the time span of a single generation surrounding the year 1500," beginning with Pico della Mirandola's *Oration on the Dignity of Man* in 1486, as the context for the birth of the *modern*[202] *self,* and the birth of the *modern cosmos*[203] (p. 4). In an earlier work, Tarnas (1991) noted that during this period, when translations of the original Greek philosophical works became available for the first time, humanist philosophical syncretism also began. What arose was a revisiting of the “ancient Greek balance and tension between Aristotle and Plato, between reason and imagination, immanence and transcendence, nature and spirit, external world and interior psyche” (p. 219). Apart from a sprinkling of individual contributions, the next major flourishing of the new integrative spirit was expressed through German idealism and Romanticism in the late 18th century. This arose most notably via Goethe,[204] Schiller, Hegel, and the young poet-philosophers of the Jena Romantic School: Schelling,[205] Novalis, the Schlegel brothers, Holderlin. Wilber claims that although the idealists were accessing forms of consciousness beyond the formal-operational, rational-mental mode, they did not offer injunctions for others to develop such consciousness, and have thus been dismissed as “mere metaphysics” (Wilber, 2000d, p. 537). This latter assertion needs to be contested, based on a recent study by Schellingian scholar, Jason Wirth, reviewed by Michael Schwartz (2005).[206] This also raises the whole question of whether Wilber’s claim in this regard is valid for any of the German idealists or Romantics. There was a strong influence of both Hermeticism and Christianity, particularly in its esoteric form through Rosicricianism in Goethe and many of the German philosopher-poets of this period. More scholarship is needed in this under researched issue. What is clear, however, is that although they pointed to the notion of a new stage, structure or movement of consciousness they did not formalize it. This apparently had to wait until the 20th century, for the contributions of Steiner, Sri Aurobindo and Gebser—subsequently pursued by Wilber and the additional research discussed below.

---

[201] By using the compound hyphenated term *postformal-integral-planetary* I am drawing on the postformal philosophy of complex thinking developed by Morin. He often uses such compound terms to denote complex integration of concepts (Morin, 2005a, 2005b).

[202] The terms *modern*, *modernism* and *modernity* are used in various ways in different contexts and it would require another article (at least) to unravel the different meanings. Steiner also used the terms *modern era* and *modern world conception* to describe the period Tarnas refers to, and also saw it as a foundation for the new emergent consciousness. I believe that Tarnas is here referring to the healthy aspects of the modernity project, which in recent centuries have become increasingly tainted and overshadowed by unbalanced, unhealthy aspects of deficient rationality.

[203] Tarnas (2006) poetically alludes to the universal Sun mythologeme to connect these two transformative events: "the Sun, trailing clouds of glory, arose for both, in one great encompassing dawn" (p. 4).

It is difficult to do justice to the new consciousness in the space available here, since its emergent nature places it in a unique situation compared with the major movements of consciousness that have already arisen and become consolidated (archaic, magic, mythical and mental). This presents several challenges in academic contextualization. Firstly, signs of its emergence can be perceived *within* various disciplines, most notably adult developmental psychology, postformal educational approaches, the new sciences, postmodern philosophy and spirituality, postmodern poetry-music-film—and also *between* disciplines, through the holistic, integral and transdisciplinary urge to integrate knowledge. A major challenge in cohering and theorizing this new consciousness is the diversity of conceptualization between the different disciplines. For example, although research from adult developmental psychology makes scientific claims to have firmly established four stages of development beyond *formal operations* (Commons, Trudeau, Stein, Richards, & Krause, 1998), postmodern philosophers who are evidently *enacting* some of these higher stages did not conceptualize it in such ways. Recent research has made significant inroads into building conceptual bridges in this area (G. Hampson, 2007). My addition to Hampson's seminal philosophical contribution to bridging integral and postmodern conceptualizations is to contextualize the adult development research on *postformal* thinking, *integral* theory, the critical *planetary* discourse *and* postmodern philosophy—and many other discourses—within the broader movement of consciousness that I am theorizing here.

---

[204] Goethe is often referred to as the father of German Romanticism.

[205] Note should also be made of the contribution in this circle of Caroline [née Michaelis], who was first married to Augustus Schlegel and later to Schelling—although 12 years his senior—who both inspired them and engaged them in challenging dialogue throughout this period: “Even our brief glance at Schelling's character must take into account the remarkable woman whose counsel and affection made a great part of his most productive years possible. I doubt whether Schelling, even as philosopher, can be well understood apart from Caroline. She herself was the idol of the whole romantic circle” (Royce, 1892/2001, Lecture 6, Part IV, ¶ 181). See also Richards (2002).

[206] Discussing Wirth’s research, Schwartz (2005) notes:

> it is not that Schelling did not have a fundamental practice-Wirth argues convincingly that he did, which ‘included the cultivation of the life of sensitivity, of a spiritualized relationship to nature and to the tradition’ (113)-but rather that this practice was peculiar to Schelling, ‘private’ one might say, in line with modernity’s public/private divide in such matters, and hence has largely gone unknown to readers of his texts, rather than this practice being part a tradition of time-tested techniques sustained by ongoing community, or its being responsive to a common cultural ethos that research that identifies new stages of consciousness development fundamental practice is requisite for authentic philosophical life. (pp. 2-3)

I propose a theoretical bifurcation between contemporary research that *actually identifies* new stage(s) of consciousness development—either individual or socio-cultural—and research that *enacts new stages of consciousness* without necessarily conceptualizing it as such.[207]

Contemporary Research that *Identifies* New Stage(s) of Consciousness

- Adult developmental psychology research that identifies several stages of *postformal* psychological development[208] (Arlin, 1999; Campbell, 2006; Cartwright, 2001; Commons et al., 1990; Commons, Trudeau, Stein, Richards, & Krause, 1998; Cook-Greuter, 2000; Kegan, 1994; Kohlberg, 1990; Kramer, 1983; Labouvie-Vief, 1990; Riegel, 1973; Sinnott, 1998; Yan & Arlin, 1995);
- Research from a range of disciplines that identifies an emergent stage in socio-cultural evolution, often referred to as *integral* or *planetary* (Beck & Cowan, 1996; Combs, 2002; Cowan & Todorovic, 2005; Earley, 1997; Elgin, 1997; Feuerstein, 1987; Gangadean, 2006a; Gebser, 1970/2005; Goerner, 2004; Montuori, 1999; Morin & Kern, 1999; Murphy, 1992; Neville, 2006; Nicolescu, 2002; Ornstein & Ehrlich, 1991; Ray, 1996; Russell, 2000; Scott, 2000; Swimme & Tucker, 2006; Thompson, 1991; Wilber, 2000b).

One of the gaps I have discerned in the literature is that—in spite of rhetoric about integrality and inclusion—much of this research operates within disciplinary boundaries without reference to the research undertaken in parallel disciplines. Wilber's work is clearly an exception to this and this is one of his significant contributions to the contemporary literature. Part of my endeavor in proposing this bifurcation is to increase understanding of the relationship between these contributions as *two* faces of the *one* evolution of consciousness.

Contemporary Research that *Enacts* New Stage(s) of Consciousness

- Philosophical developments, including critical theory, global reason, hermeneutics, integral theory, phenomenology, postmodernism, poststructuralism and process philosophy (Benedikter, 2005; Deleuze & Millett, 1997; Derrida, 1995; Foucault, 2005; Gangadean, 1998, 2006b; Gare, 2002; Habermas, 1992; Hampson, 2007; Keller &

---

[207] This bifurcation is a rough guide and the two categories are not necessarily mutually exclusive. To further this proposition would require more research.

[208] The next issue of the journal *World Futures: the Journal of General Evolution* will be a special triple issue integrating the latest research on postformal reasoning.

Daniell, 2002; Kristeva, 1986; Lyotard, 2004; McDermott, 2001b; McDermott, 2004; Morin, 2005a; Ricoeur, 1986);

- Scientific developments such as quantum physics, Einstein's theory of relativity, chaos and complexity sciences, and emergentism in evolution (Combs, 2002; Deacon, 2003; Goodenough & Deacon, 2006; László, 2007; Russell, 2000, 2002; Swimme, 1999; Thompson, 1991; Zajonc, 2004);
- Postmodern approaches to spirituality and religion (Benedikter, 2005; Boadella, 1998; Clayton, 2006; Esbjörn-Hargens & Wilber, 2006; Scott, 2007; Tacey, 2003; Wilber, 2006);
- Postformal educational approaches, such as critical, futures, holistic and integral (Esbjörn-Hargens, 2005; Ferrer, Romero, & Albareda, 2005; Freire, 1970; Gidley, 2005b, 2007; Giroux, 1992, 2005; Hart, 2001; Kessler, 2000; Kincheloe, Steinberg, & Hinchey, 1999; MacLure, 2006b; Marshak, 1997; McDermott, 2005; Miller, J. P., 2000; Miller, 2005, 2006; Milojevic, 2005a; Montuori, 2006; Morin, 2001a; Neville, 2000; Noddings, 2005; Palmer, 2007; Slaughter, 2002; St. Pierre, 2004; Subbiondo, 2005; Thompson, 2001);
- The manifestation of integrality through the arts of music; architecture; painting; literature; film; and new forms of movement (Cobusson, 2002; Deleuze & Conley, 1992; Derrida, 2001; Gebser, 1949/1985; Gidley, 2001e; Kristeva, 1982; Lawlor, 1982; Montuori, 2003; Rose & Kincheloe, 2003);
- The implications of the information age, particularly the world wide web (Gidley, 2004c; Grossman, Degaetano, & Grossman, 1999; Healy, 1998; Pearce, 1992; Steinberg & Kincheloe, 2004; Thompson, 1998);
- Creation of knowledge-bridges through, for example, Wilber's "methodological pluralism" (Wilber, 2006); interdisciplinary, cross-disciplinary, multi-disciplinary and trandisciplinary research (Grigg, Johnston, & Milson, 2003; Nicolescu, 2002; Paul Ricoeur, 1997; van den Besselaar & Heimeriks, 2001; Volckmann, 2007); including new fields such as cultural studies, futures studies and integral studies.

Terminology Issues

It is evident from the above that in addition to Steiner, Gebser and Wilber, many other researchers have endeavored to understand, characterize and communicate the new consciousness. Paradoxically, their contributions to understanding and communicating this phenomenon demonstrate both universal similarities and unique particularities. There is a profusion of terminology in the field—both between and within disciplinary boundaries. The major terms being used are:

- *Postformal*—to denote new developmental stages. Adult developmental psychologists have been undertaking research into postformal thinking for several decades, identifying up to four stages of development beyond Piaget's formal operations (Arlin, 1999; Campbell, 2006; Cartwright, 2001; Commons et al., 1990; Commons, Trudeau, Stein, Richards, & Krause, 1998; Cook-Greuter, 2000; Kegan, 1994; Kohlberg, 1990; Labouvie-Vief, 1990; Sinnott, 1998; Yan & Arlin, 1995). The term *postformal* is also being utilized by several educationists (Horn, 2001; Kincheloe & Steinberg, 1993; Kincheloe, Steinberg, & Hinchey, 1999; Rose & Kincheloe, 2003). Kincheloe and

Steinberg (1993) refer to post-formality as the socio-cognitive expression of postmodernism[209] (p. 309);

- *Integral*[210]—there are now several different schools of thought that use the term integral, which it is beyond the scope of this paper to discuss in detail. This section will be mainly concerned with the usages of Gebser and Wilber, but my own usage of the term is primarily according to the usage of Gebser, which, in my view, most adequately contextualizes the other usages. Other terms relating to the new consciousness, such as Gebser's *aperspectival*; Wilber's *vision-logic*, *centaur* and *AQAL*; and Steiner's *consciousness soul* or *spiritual soul* will be clarified where appropriate;
- *Planetary*—to denote a critical counterbalance to the more politico-economic term: globalization, as mentioned in the introduction. The term, *planetary*—which denotes a more anthropo-socio-cultural and ecological framing is gaining increasing currency as a term to characterize important features of the new consciousness, particularly for those theorists who have a critical sensibility in the light of our complex current planetary situation (Earley, 1997; Gangadean, 2006a; Miller, 2006; Montuori, 1999; Morin & Kern, 1999; Nicolescu, 2002; Swimme & Tucker, 2006).

Gebser used the term *integral-aperspectival*[211] to refer to the gradual transformation through awareness, concretion and integration of all the previous structures of consciousness that we have been exploring—archaic, magic, mythic and mental—into a new structure of consciousness.

> The aperspectival consciousness structure is a consciousness of the whole, an integral consciousness encompassing all time and embracing both man's distant past and his approaching future as a living present. (Gebser, 1949/1985, p. 6)

Gebser[212] and others credit Sri Aurobindo with being the first to draw attention to a new movement of consciousness arising in his time (Anderson, 2006). In his earliest writings on evolution, included in his first publication *Karmayogin*, Sri Aurobindo draws attention to a deeper, more ancient lineage behind modern evolution theory than Charles Darwin, or even the

---

[209] *Postmodernism*—a term to denote a critical or deconstructive philosophical perspective in relation to certain features of modernism. While postmodernism is not generally regarded as a new stage, structure or movement of consciousness, I note Hampson's recent paper pointing to the construct awareness of Derrida (Hampson, 2007). I support the notion that much of French philosophical postmodernism or deconstruction could be regarded as an expression of aspects of the new consciousness.

[210] See earlier note introducing the term *integral* in relation to related terms, such as *holistic* and *integrative*.

[211] The appropriateness of Gebser's use of the term *aperspectival* has been supported by the psychological research on higher postformal stages, such as the *metasystematic* and *paradigmatic* stages, in which a person is not attached to time, interests, groups, or their own perspective but are able to coordinate many perspectives simultaneously, i. e. consciousness of the whole (Commons, Trudeau, Stein, Richards, & Krause, 1998).

[212] Gebser (1949/1985) discovered Sri Aurobindo's writings only *after* the first German publication of his *Ever-Present Origin* in 1949, and he claimed in the Preface to the second edition, in 1966, that: "Sri Aurobindo was the first to propound in detail the thought that the fundamental and signal event of our time was the present-day transformation of consciousness" (p. 102).

German idealists (Aurobindo, 1909). He draws on the seminal evolutionary writings of the ancient Indian sacred texts, the *Upanishads*.[213] A close scrutiny of the early 20th century writings of Steiner and Sri Aurobindo points to the likelihood that the latter met and was influenced by Steiner during these seminal times, though I am still researching this possibility.[214]

My research indicates, however, that as early as 1904, Steiner had already identified an emergent movement of consciousness,[215] both ontogenetically—as an aspect of individual development—and phylogenetically—arising in humanity as a whole (Steiner, 1904/1959, 1986a). He spoke of the awakening of *consciousness soul* or *spiritual soul* in the fifth [post-glacial] cultural period that began in the early 15th century CE and would continue to develop on into the future (Steiner, 1986a pp. 97-105). He also claimed that this new consciousness would be expected to strengthen in the 20th and 21st centuries and beyond. He noted that the true nature of the self, the *I*, "reveals itself in the consciousness soul . . . An inner activity of the I begins with a perception of the I, through self-contemplation." (Steiner, 1910/1939, p. 31) Hence his use of the term "Consciousness Soul, [in which] the Ego is then able to transform its inner experiences into conscious knowledge of the outer world." (Steiner, 1930/1983a, pp. 23-24) This reflective self-contemplation resembles Wilber's (2000d) "vision-logic [that] . . . finds its own operation increasingly transparent to itself" (p. 193).

Wilber draws on Gebser and Sri Aurobindo among others, as well as the developmental psychology research on postformal thinking, so his work is a remarkably sweeping synthesis, though by no means complete, or accurate in all the details of its sources, as he himself admits (Wilber, 2000a, p. xii). He notes that what unites all these perspectives is that they all point to something that goes beyond formal, modernist, abstract, rational thinking. He has coined the term *vision-logic* to describe this stage—an appropriate term because of its inherent dialectical nature.

> Where perspectival reason privileges the exclusive perspective of the particular subject, vision-logic *adds up all the perspectives*, privileging none, and thus attempts to grasp the integral, the whole, the multiple contexts. (Wilber, 2000b, p. 167)

In summary, Steiner's major contributions were: he was the first to identify in writing, as early as 1904, a new consciousness emergence,[216] and to write and lecture *extensively* on the evolution of consciousness, building on ancient Indian, Greek *and* particularly, German idealist/Romantic lineages; and secondly, he developed and published a comprehensive series of practices/injunctions designed to awaken the new consciousness in humanity—particularly through education, contemplative practices and the arts (Steiner, 1905/1981b, 1904/1993 1926/1966b, 1930/1983a, 1950, 1904/1959, 1964a, 1909/1965, 1966a, 1971a, 1982b, 1986a).

---

[213] The *Upanishads* are the ancient Indian sacred texts referred to in the earlier section on Ancient India.

[214] During the decade between 1902 and 1912 they both had some connection with the Theosophical Society in England before both writing critically about its operations, at approximately the same time. Further research is being undertaken for a later publication.

[215] Steiner also genealogically identified much earlier Vedanta Indian and ancient Greek lineages of evolutionary notions, which is beyond the scope of this paper to explore.

[216] This information, based on extensive research, is correct to the best of my knowledge; however, I am very open to hearing contra-indications on this matter, which I consider to be of some importance in establishing the sound foundations of the knowledge base of both integral theory and the evolution of consciousness discourse.

Gebser's major contributions were: firstly, to begin to academically formalize the emergent integral structure of consciousness;[217] and secondly, to observe and note its emergence in the world in various disciplines and discourses in the first half of the last century (Gebser, 1949/1985, 1970/2005, 1996a). Tragically, both Steiner's and Gebser's outstanding contributions have been largely ignored by the Anglophone academic world, as mentioned in the rationale for this research.

Wilber's major contributions so far have been: firstly, to synthesize, contemporize and popularize much of the earlier research;[218] and secondly, to theorize a framework—the most recent form of which is AQAL[219]—designed to assist with the application of his integral theory to a range of disciplinary fields (Wilber, 1996b, 1996c, 2000a, 2000b, 2000d, 2004, 2006). Thirdly, Wilber has popularized the need for injunctions, or *integral life practices*,[220]already emphasized by Steiner and Sri Aurobindo and more recently in the USA by George Leonard and Michael Murphy—not to mention millennia of spiritual and religious practices across numerous traditions. I acknowledge that this latter contribution of Wilber's provides some counterweight to critiques about his cognicentrism.

An important point in considering this new movement of consciousness is that unlike the previous structures, most of which tended to have a geographic locale—although not necessarily a single one—the new emergence is, by its own nature, planetary, cosmopolitan. This will become more evident below and is further developed in Appendix B. It is important to distinguish such a *planetizing*[221] noospheric movement—which emphasizes the more inner-oriented developments of psychology and culture, with respect for individual and cultural diversity—from the notion of *globalization*[222]—primarily a politico-economic movement based on the agendas of multi-national corporations, but tacitly carrying with it—like a *Trojan horse*—a largely modernist, materialistic, mono-cultural worldview. It is critically important to question whether contemporary integral theory has been colonized by Americocentrism, or Eurocentrism, or whether it fully embodies a *planetary* sensibility in all its cultural diversity.[223] A fully integral theory of planetary consciousness would transcend and include the politico-economic notion of globalization. The latter could be regarded as an attempt to dominate cultural worldviews and consciousness around the planet with outmoded characteristics of the previous stage of consciousness development.

---

[217] Although Gebser was clearly not familiar with Steiner's extensive research in the area of evolution of consciousness, his characterizations of integral consciousness bear a remarkable similarity to Steiner's writings on consciousness/spiritual soul, just a few decades earlier. The strong links between their writings has already been demonstrated throughout this paper.

[218] Wilber's omission of any substantial consideration of Steiner's extensive research on evolution of consciousness, other than a few brief comments, has been a primary impetus for my research.

[219] For readers new to Wilber's work, AQAL refers to all quadrants, all levels, all lines, all states and all types, these being the five major dimensions of his theoretical framework (Wilber, 2004).

[220] Wilber was influenced by the *Integral Transformative Practices* developed by integral practitioners, George Leonard and Michael Murphy. http://www.itp-life.com/

[221] Teilhard de Chardin coined the term *planetization* to characterize his perspective of the new consciousness that he envisioned emerging in the noosphere (Teilhard de Chardin, 1959/2002, 1959/2004).

[222] Although globalization ostensibly assists with the equalizing of wealth across the globe by opening up a free market economy worldwide, the proposed outcomes have been the reverse. "On a global scale . . . there is increasing inequality between the 'developed' nations (where 20% of the world's population consumes 80% of world production) and those that remain undeveloped" (Morin & Kern, 1999, p. 17).

In the theory of emergent consciousness that I am developing through the journey of this narrative, the term *planetary*[224] refers to the critical awareness of the impending planetary crisis. It also implies that no race, nation, language group, religion, ideology, academic discipline or single brand of integral theory can claim ownership of the new movement of consciousness. Unless the integral theory in relation to the evolution of consciousness arises out of such epistemological and cultural *diversity*, it would hardly qualify for the descriptor *integral*.

To honor and integrate the diversity of the three major notions that inform the several growing tips of the evolution of consciousness discourse, I propose the composite term *postformal-integral-planetary consciousness* as a conceptual bridge.

I am aware that this section may suffer from some of the folds, doubling and circling that Foucault struggled with in his concept of the "immanent transcendental," where the "forces of the outside . . . fold back upon themselves and affect themselves as the affect of self upon self, enabling the creation of 'new forms of subjectivity'" (Robinson, 2007, p. 21). Demonstrating the paradoxical circularity of the new consciousness, Foucault adds: "indeed the end of philosophy . . . is the return of the beginning of philosophy. . . . The unfolding of a space in which it is once more possible to think" (Foucault, 1966/1994, p. 342). Additional more extensive work is in preparation that builds on this gestalt of fragments. Sri Aurobindo pointed 50 years ago to the difficulty in writing about integrality:

> Integrality must by its nature be complex, many-sided and intricate; only some main lines can be laid down in writing, for an excess of detail would confuse the picture. (Aurobindo, 1997, ¶ 152, p. 359)

Key Features of Postformal-Integral-Planetary Consciousness

One of the biases that this research seeks to address in the literature is that much of the research establishing *postformal* thinking has been framed and presented from a formal, mental-rational mode. While this formal scientific theorizing has clearly contributed a great deal to the discourse by giving it credibility within the academy—which is still largely operating from this mode—it is important that this does not set a biased template for acceptability of research in this area. A second—and related—bias is that within much postformal and integral research there is a privileging of cognicentric content and writing styles, potentially further marginalizing other types of postformal/integral research that may reflect and seek to integrate other modes of expression:

---

[223] For more discussion of this issue see (Anderson, 2006).

[224] While technically the term *global* could be used here instead of *planetary*, I am concerned that its semiotic links with *globalization* may taint its meaning. Also I wish to honor the substantial emergent literature on the rise of planetary culture and consciousness.

- Affective (Loye, 1998; Nava, 2001; Noddings, 2005; Sinnott, 2005; Zajonc, 2005b);
- Aesthetic (Deleuze & Conley, 1992; Derrida, 2001; Gidley, 2001e; Rose & Kincheloe, 2003; Roy, 2006b); or
- Participatory modes (Ferrer, Romero, & Albareda, 2005; Hampson, 2007; Hart, 2000).

The initial focus below on the *reintegration of the whole person* is a core theoretical focus of this research. As indicated, humans have become *brain-bound* during the establishment of the intellectual-mental-rational mode. An integrative imperative to awaken artistic and participatory modes of consciousness comes through strongly in both the content and style of Steiner's and Gebser's writings—and in Wilber's conceptual notion of the *Big Three* and his *Integral Life Practices*. In summary, from this perspective, the move beyond mental-rationality requires an integration of the search for *Truth*—via scientific and philosophical epistemologies; with *Beauty*—via artistic/aesthetic sensibilities; and with *Goodness*—via participatory embodiment and critical enactment of the truth claims that we profess. I propose that this is a foundational point—often overlooked—that could ground postformal-integral-planetary consciousness in a *concretion*[225] of all consciousness modes, rather than a primarily conceptual abstraction of what integrality might be.

This new movement of consciousness is highly complex—with *complexity* itself being one of its features. The following themes have arisen from the three narratives and with due consideration of the postformal, integral and planetary literature listed above. My process here attempts a further transdisciplinary cohering of theoretical contributions so far, thus broadening and deepening the current discourse.

- Reintegration of the whole person—originary spiritual presence, magic vitality, mytho-poetic imagination, mental directedness—embodied/enacted through integral transparency;
- Integration of dualisms, such as spirituality and science, imagination and logic, heart and mind, female and male;
- Transcending of egotism;
- Transcending linear, mechanical, clock-time through concretion of time-awareness (See Appendix A);
- Planetization of culture and consciousness (See Appendix B);
- Linguistic self-reflection and the re-enlivening of the word.

In the space available the first three points above will be briefly explored and the following two have been discussed in some depth in the appendices. The final point is the subject of ongoing research in collaboration with Gary Hampson, intended for future publication.

---

[225] Gebser uses the term *concretion* to mean an experiencing in fully awake consciousness of all the previous structures in the same moment.

Reintegration of the Whole Person

For Gebser, integral-aperspectival consciousness is not experienced through *expanded* consciousness, more systematic conceptualizations, or greater quantities of perspectives. In his view, such approaches largely represent over-extended, rational characteristics. Rather, it involves an actual re-experiencing, re-embodying, and *conscious re-integration* of the living vitality of magic-interweaving, the imagination at the heart of mythic-feeling *and* the purposefulness of mental conceptual thinking, their presence raised to a higher resonance, in order for the integral transparency to shine through. Sri Aurobindo's integral yoga with its threefold path of *knowledge*, *love* and *action* and the integral education model that was inspired by it, reflects Gebser's type of integration (Aurobindo, 1909). These, in turn, parallel Steiner's notion of the development of consciousness soul through an education that integrates the thinking/head (knowledge), the feelings/heart (love), and the hands/will (action) (Steiner, 1927/1986c, 1909/1965). Wilber's *Big Three*—based on Plato's Truth, Beauty and Goodness—would appear to be representing similar archetypes (Wilber, 2000d). Further research would be needed to establish more rigorous theoretical links. In an endeavor to embody this approach, the following is not designed to summarize, evaluate or even synthesize the extensive research on the various postformal cognitive features identified by adult developmental psychologists, or to integrate the multiple perspectives of thought in various fields, but to attempt to *embody* and *enact* the type of integrality that Gebser himself enacted.

Integration of Dualisms

A central notion of integral-planetary consciousness is the overcoming of dualisms (Gebser, 1949/1985, p. 386). This borrows from Foucault's critical awareness of power relations and what Derrida (1998) called violent hierarchies—those pairs of binary oppositions that have been driven apart through centuries of Cartesian dualism. This section will briefly explore four of these pairs that have been identified as significant and in need of reintegration in the new consciousness.

One of the strands of integral theory is particularly concerned with the reintegration of **spirituality and science**—or science and religion/theology. The beginnings of the reuniting of science and spirit are a reflection of the new consciousness movement and point towards increasingly integrated future cultural developments (Bohm, 1980; Clayton & Simpson, 2006; Conway Morris, 2007; Esbjörn-Hargens & Wilber, 2006; László, 2007; Nicolescu, 2002; Russell, 2000; Scott, 2007; Swimme, 1999; Swimme & Tucker, 2006; Wilber, 1998, 2001d; Zajonc, 2004). There is, as to be expected, some contestation as to which epistemology the integration might be framed within. From László's integral perspective, science must be at the basis of integral theory. In his recent book setting out his *Integral Theory of Everything,* László (2006) critiques Wilber's (2000a) *Theory of Everything*.

> [Wilber] speaks of the "integral vision" conveyed by a genuine TOE. However, he does not offer such a theory; he mainly discusses what it would be like, describing it in reference to the evolution of culture and consciousness—and to his own theories. An actual, science-based integral theory of everything is yet to be created. (p. 11)

Yet for Wilber, this privileging of science over the other disciplines is at the basis of his claim that László's TOE is partial (Wilber, 2006). A possible explanation for this difference of view is that László and Wilber may have different concepts of what the term *theory* actually means. For László it clearly has a basis in formal scientific epistemology, whereas for Wilber the term *theory* may be being used more broadly—as it often is in the humanities and social sciences. Perhaps it is useful to think of theory-development itself as having developmental stages. It is also important to recognize that different disciplines do have different types of truth claims. Clarification of such issues is an important part of the establishment of *integral theory* and would be assisted by a more collaborative effort in theory-building (Murray, 2006). Admittedly, László agrees with Wilber that such a theory would need to take into account ”life, mind, culture and consciousness” as parts of the world's reality, yet his own science-based theory does not address them in great detail (László, 2007). This is not uncommon in scientific theories, which focus on providing premises and axioms that can be generalized. A point to note here is that Wilber, László—and others—may also have different interpretations of the concept of *science*. It is important to distinguish in such a dialogue between the ideology of scientism[226] and the broader notion of the empirical[227] basis of experience. The latter could theoretically include Goethe's *delicate empiricism* (Holdrege, 2005; Robbins, 2006); William James' *pragmatism*—originally designed to empirically research the *something more* beyond physical realities (Gitre, 2006; McDermott, 2001); scientific studies on effects of meditation, yoga and para-psychological phenomena (The Dalai Lama, Benson, Thurman, E., & Goleman, 1991); and Steiner's (1986a) spiritual science. Many integral scientists are working to attempt to broaden the embrace of science (Goerner, 2004; Russell, 2002; Scott, 2007; Swimme, 1999; Visser, J., Barach, John, & Visser, 2007; Zajonc, 2004).

Wilber (1998) also points to the need to reintroduce *wonder* into the gap between science and religion, noting that, “if Spirit does exist, it will lie in . . . the direction of wonder, a direction that intersects the very heart of science itself” (p. ix-x). He has devoted a book to the reintegration of science and religion (Wilber, 1998), and also published a recent book chapter on the subject (Esbjörn-Hargens & Wilber, 2006). Steiner pointed to an important paradox: On the one hand the earlier, more macrocosmic, sciences—e.g., the hermetic-alchemical-scientific writings up to the 14th century—were superseded by the more materialistic view of modern science. On the other hand, he claimed that our times have the potential to be highly favorable to spiritual development, based on what we can bring through from within ourselves.

---

[226] The term, *scientism* has a variety of interpretations, but is meant here in its perjorative sense—as the view that scientific theory and methods are the only applicable ones regardless of the field of inquiry. As integral scientist, David Scott, notes, “Learning must overcome the dualisms created by scientism of the earlier era—dualisms of mind and matter, of science and religion, truth and meaning, facts and values.” http://www.learndev.org/BOP-AECT2002.html

[227] The term *empiricism* has also been narrowed in a similar process. The etymology of the word empirical demonstrates its earlier, broader usage. First recorded in 1569, from L. *empiricus,* from Gk. *empeirikos* "experienced," from *empeiria* "experience," from *empeiros* "skilled," from *en-* "in" + *peira* "trial, experiment." The original referred to “a school of ancient physicians who based their practice on experience rather than theory.”
http://www.etymonline.com/index.php?search=empirical&searchmode=none

> What can make this epoch great must be brought about from the forces of the spiritual life, world-knowledge, world-conception. [We are] shut off from the heavenly forces . . . confined in the materialistic period. But . . . [we have] the greatest possibility of making [ourselves] spiritual . . . a spiritually free humanity. (Steiner, 1971a, pp. 56-57)

Steiner claimed that it would become increasingly possible to build on the intellectual faculties developed in humanity in the recent past—to begin as individuals to consciously develop more spiritual powers of *Imagination*, *Inspiration* and *Intuition* (Steiner, 1910/1939, p. 306). While Gebser does not particularly refer to the science-spirit dualism, he does stress that overcoming all dualisms is central to integrality. Steiner's coinage of the dialectical term *spiritual science* as the descriptor for his entire spiritual epistemology indicates the priority he gave to bridging the science and spirituality split (Steiner, 1986a).

The second binary strand to be considered is **heart-mind**—related to the reintegration of the heart in thinking, particularly through reverence, awe, wonder and love. This feature is arising with some strength now in the postformal—particularly the holistic—education literature (Hart, 2000; Kessler, 2002; Miller, J. P., 2000; Miller, R., 1990, 2000; Nava, 2001; Noddings, 2005; Palmer, 1998; Zajonc, 2005a). The following extract is a good example of this warmth-imbued holistic education discourse.

> A spiritual worldview is a *global* paradigm . . . an *ecological* paradigm. . . . Ultimately, a spiritual worldview is a *reverence for life*, an attitude of wonder and awe in the face of the transcendent Source of our being. (Miller, 1990, p. 154)

This encapsulates the *heart* of an integral-planetary consciousness where the horizons between holistic and integral theories fuse and we struggle for the most suitable language—language that is least likely to be colonized for other purposes. It is an authentic postformal spiritual response to the cold, heart*less*ness of the contemporary neo-fundamentalist hybrid of *politics-economics-scientism*. The latter is best exemplified in the *audit culture* currently colonizing mainstream western education and educational research agendas (Denzin, 2005; Giroux, 2003, 2005; Johnson, 2005; MacLure, 2006a, 2006b). Teilhard de Chardin (1959/2004) made the observation that humanity has been building its composite brain, and that perhaps it is now time to find its collective heart, "without which the ultimate wholeness of its powers of unification can never fully be achieved" (p. 172). The Greek term for this was *thymos*—the courage of the heart—a quality that the Greeks considered to be part of the essence of soul (Boadella, 1998, p. 9). This courageous call to bring the heart back into education was already made by early 20th century educational pioneers, most notably for this discussion, by Steiner.[228] In fact, he pointed to the importance of bringing *love* and *devotion* into all our knowledge seeking. He claimed that these two combined create *reverence,* which he argued is vital for moving into the new consciousness rather than merely extending abstract intellectualism *ad infinitum*. Steiner explained that the emphasis on *head-knowledge* that has been a necessary part of the development of human freedom needs to be warmed and enlivened by *heart-knowledge* in the present cultural period (Steiner, 1971a, p. 84).

---

[228] Other educational pioneers such as Johann Pestalozzi (1746-1827), Friedrich Fröbel (1782-1852), and Steiner's contemporaries Sri Aurobindo (1872-1950) and Maria Montessori (1870-1952), also stressed the integration of the whole child.

> Love and devotion are thus the right guides to the unknown, and the best educators of the soul in its advances from the Intellectual Soul to the Consciousness Soul. Whereas . . . the striving for truth educates the Intellectual Soul, *reverence* educates the Consciousness Soul, bringing more and more knowledge within its reach. But this reverence must be led and guided from a standpoint which never shuts out the light of thought. (Steiner, 1930/1983a, p. 60) (emphasis added)

Gebser makes little reference to *love* in *The Ever-Present Origin*, but makes the following understated link between love and the apersonal, elsewhere (Gebser, 1970/2005).

> The apersonal can only be perceived by an apersonal, egofree human. This is, by the way, not only an Indian or East-Asian wisdom but also a Christian: it is a universal basic condition and necessity of humankind. Whoever complies to them, experiences a strengthening of his vitality and an improvement of extensive capability of love, which is presently more than ever necessary in our threatened world dissipating the human; but this need not particularly be emphasized. (Online text)

Gebser (1949/1985) primarily connects the heart and its rhythms with mythical consciousness. However, he gives two examples of philosophers struggling to experience the integral-aperspectival consciousness, citing Pascal's "logic of the heart" and Heidegger's "invisible, innermost heart . . . which for all of us is beyond quantitative calculation and can freely overflow the limits into the whole, the open." (p. 411) Both of these suggest that reintegration of the heart, like reintegration of other mythic qualities, is an important feature of Gebser's conception of integral.

Wilber occasionally refers to terms such as *heart*, *love*, *devotion* and *reverence* in his published books. He includes *love* in one of his definitions of spirituality, but considers this a fairly unsatisfactory definition (Wilber, 2000b, p. 133). His major conceptual engagement with the notion of *love* is through his discussion of Eros and Agape (Wilber, 2000d). Referring to what he calls "Plato's *Eros,*" and "Christian *Agape*," he claims, citing Charles Taylor's (1989) *Sources of the Self*, that "the two together make a vast circle of love through the universe." Wilber then continues to discuss how this actually works in individual development.

> In individual development, one *ascends* via Eros (or expanding to a higher and wider identity), and then *integrates* via Agape (or reaching down to embrace with care the lower holons), so that balanced development transcends but includes . . . Agape and Eros are united only in the nondual Heart. (Wilber, 2001a, p. 349)

Given the linearity of Wilber's model as discussed in Appendix A, where nondual experience is not possible until all other development has preceded it, one wonders where that might leave Wilber's theory in relation to heart-mind integration at any of the levels *lower* than the very top of his model. Although he stresses body-mind integration through his *centaur* metaphor, it is unlikely that this is intended to equate with heart-mind. This may be a major theoretical divergence between Steiner and Wilber in light of the centrality Steiner gives to the cultivation of love and reverence as educative forces for the consciousness soul (Wilber's vision-logic). Steiner's position on this is also consistent with his overall philosophy which—based on my reading—appears to be nondual all the way through, although he does note that notions of dualism, particularly concepts of separation between spirit and matter, did arise and become artificially exaggerated through the two millennia of intellectual development. He regarded this as a necessary part of the development of the rational intellect as part of ego-development on the way to ego-freedom. However, he stressed the urgent need for the reintegration of this split, beginning with the emergent consciousness soul. Hence his call to bring heart and love back together with mind and knowledge (Steiner, 1971a, p. 84).

Another significant dualism to be overcome is between **imagination and logic**. Wilber's term—*vision-logic*—is a pre-eminently dialectical term that reintegrates the *vision* of postformal imaginative thinking with the *logic* of formal thinking. It archetypally represents a key feature of what the new consciousness stands for. In a rather lengthy quotation, Wilber attempts to explain in some detail how vision-logic—that he also refers to as network-logic—operates. Wilber (2000b) describes a process closely resembling hermeneutic circling which clearly involves an integration of a type of logic with a type of "big picture" vision in order to gradually arrive at a higher more integrated level of understanding.

> A logic of inclusion, networking, and wide-net casting is called for; a logic of nests within nests. Each attempting to legitimately include all that can be included. It is a vision-logic, a logic not merely of trees but also of forests. Not that the trees can be ignored. Network-logic is a dialectic of whole and part. As many details as possible are checked; then a tentative big picture is assembled; it is checked against further details, and the big picture readjusted . . . For the secret of contextual thinking is that the whole discloses new meanings not available to the parts, and thus the big pictures we build give new meanings to the details that compose it. (p. 2)

For Gebser, the reintegration of the imagination is primarily related to what he would call the conscious awareness and concretion of the mythical structure. Steiner (1984b), on the other hand, has a rather complex characterization of the significance of imagination. He certainly sees it as a crucial factor in the emergent consciousness. In a similar manner to Wilber's *vision-logic* he refers to two major features that need to be activated for consciousness soul to develop: "a clear perception of the sense world" that he notes has been assisted by the empirical sciences, and the unfolding of "free imaginations side by side with the clear view of reality" (Lecture 2). For Steiner, the conscious cultivation of the *Imagination*—resembling Schelling's notion of the *intellectual imagination*—is a crucial early step in psycho-spiritual development (Steiner, 1905/1981b). A resurgence of interest in imagination is evident in both educational (Abbs, 1994; Broudy, 1987; Egan, 1990; Eisner, 1985; Gidley, 2001e, 2003, 2004b; Giroux, 1998; Hutchinson, 1993; Neville, 1989; Nielson, 2006; Nuyen, 1998; Sloan, 1992; Takaya, 2003) and postmodern philosophical circles (Abbs, 1994; Deleuze & Conley, 1992; Derrida, 2001; Kearney, 1998; Lyotard, 2004; St. Pierre, 2004; Whitehead, 1919; Wilber, 1990).

Finally, the overcoming of the deficient dualism of **female and male**[229] is required, according to all three narratives, in order to experience integrality of consciousness. As we have seen, the earliest consciousness structures primarily arose in matriarchal cultural settings, while the emergence of the intellectual-mental-rational structure in the first millennium BCE, with its egoic focus, paralleled the beginnings of patriarchy at least in Greece, Rome and China. The new consciousness will not be a return to matriarchy as some might suggest, rather a new form of sovereignty that Gebser (1949/1985) called the *integrum*.

---

[229] Though, paradoxically, they all favor the male gender in their pronoun usage—this was standard writing convention in Steiner's and Gebser's times, but not so Wilber's.

> As matriarchy was once succeeded by patriarchy, patriarchy should be succeeded by the "integrum," as we have designated it. In this integral world neither man nor woman, but rather both in complement as human beings, should exercise sovereignty. (p. 151)

Wilber (1996c) suggests that the new dragon we must fight—the ego structure itself—requires a new Hero Myth. He suggests that the new hero will be "mentally androgynous, psychic, intuitive *and* rational, male *and* female—and the lead in this new development most easily can come *from* the female, since our society is *already* masculine-adapted" (p. 270). Steiner also made numerous comments in various lectures to the effect that the polarizing that had developed between male and female would gradually reduce so that men and women could begin to work together in new ways. He noted that the cultivation of the arts and particularly men and women working together creatively could assist this process. It is possible this will lead to a gradual re-feminization of culture through a re-awakening of imaginative, artistic, relational forms of postformal reason, including a re-focusing from *outer* space to *inner* space. Eisler (2000, 2001) discusses what such a new gender partnership model might look like for education.

Transcending of Egotism

What is common to the understanding of Steiner, Gebser and Wilber in regard to the emergent consciousness—but by no means in all the developmental psychological or philosophical views that posit postformal stages, is the relationship between post-formal, integral consciousness and the opening to spiritual awareness. This may be seen to reflect the shift from what Wilber calls *small ego* to *pure Self*; what Steiner refers to as the shift from *egoism/egotism* to *higher ego*—that part of the human being from which she consciously transforms herself; and what Gebser (1949/1985) refers to as the shift from *egotism/egocentricity* to *ego-freedom*.

> Only the overcoming of the "I," the concomitant overcoming of egolessness [deficient magic] and egotism [deficient mental-rational], places us in the sphere of ego-freedom, of the achronon and transparency. (p. 532)

Gebser (1949/1985) links this with the Christian notion of *transfiguration* (p. 531). In a sense, Gebser is referring to the ability of the human *I* to transcend itself. In apparent contradiction, Steiner stressed the divine spiritual aspect of the *I*.

> Indeed with this designation "I," we stand before that innermost being of [humanity] which can be called the divine element . . . [As] active being[s] [we] must . . . take hold of [our] own evolution. [We] must raise [ourselves] to higher stages than the stage[230] [we have] already reached; [we] must develop ever new forces, so that [we] may approach continually towards perfection. (Steiner, 1930/1983a, p. 20)

---

[230] It is worth noting that Steiner uses the terminology of *stages*, here, as used in the contemporary adult psychology literature.

This apparent contradiction may be illuminated by the notion of the "I-I"—the ego that reflects on itself—also known as the Witness, which Wilber (2000d) derives from Plato's "the Spectator of all time and existence" especially via Fichte, in the West, and the Hindu Vedanta in the non-West (pp. 332, 670-672, n. 19).

This paradoxical nature of the human sense of *I* is referred to by Benedikter (2005) as the *double I* emerging in the late philosophical works of several French, postmodern philosophers.

> The late Derrida is very near to the "real presence" of a meta-formal, meta-linear "double consciousness," of the "paradoxical unity of two consciousnesses in one." . . . Words which are spoken (subjectively) and observed (objectively) at the same time. Words, which are experienced by the inner *and* by the outer side *at the very same moment* of happening. Thus, the late Derrida is near the experience of the "two I's in one" of all the enlightened mystics of the traditions. (Online article)

This echoes some of Steiner's (1910/1939) words about the *I* and its double reflective nature in relation to the consciousness soul.

> The true nature of the I reveals itself only in the consciousness soul. . . . through a certain inner activity . . . if the I wishes to observe itself . . . It must first through an inner activity, draw its being out of its own depths in order to have a consciousness of itself. An inner activity of the I begins with a perception of the I, with self-contemplation. (p. 31)

Wilber (2000c) also characterizes the significance of the relationship between mature ego development and spiritual development. Referring to the great spiritual teachers and world leaders from earlier periods, he states:

> To the extent these great teachers moved the gross realm, they did so with their egos, because the ego is the functional vehicle of that realm. They were not, however, identified merely with their egos (that's a narcissist) . . .
> "Transcending the ego" . . . means we do not "get rid" of the small ego, but rather, we inhabit it fully, live it with verve, use it as the necessary vehicle through which higher truths are communicated. . . . the ego is not an obstruction to Spirit, but a radiant manifestation of Spirit. (p. 278)

In the following three features it is interesting to note that there is a slightly different emphasis given to each of these by Steiner, Wilber and Gebser.

Transcending of Linear, Mechanical, Clock-Time

What Gebser calls the *concretion of time* is for him arguably the most significant marker of the emergent integral-aperspectival consciousness. He refers to Picasso's cubist, multi-faceted, portrait paintings to illustrate.

> Only where time emerges as pure present and is no longer divided into its three phases of past, present and future, is it concrete. To the extent that Picasso from the outset reached

> out beyond the present, incorporating the future into the present of his work, he was able to "presentiate" or make present the past. (p. 26)

Steiner and Wilber also problematize linear time as a construction of intellectual-mental-rational consciousness, and, like Gebser, discuss several alternative notions of time in relation to earlier movements of consciousness as will be discussed further as well. *Concretion of time* is a difficult concept to grasp, hence the extended discussion in Appendix A.

Planetization of Culture and Consciousness

Wilber (2000d) appears to stress the importance of global and planetary awareness as an important feature of integral consciousness and claims that it is expressed through his vision-logic.

> As rationality continues its quest for a truly universal or global or planetary outlook, noncoercive in nature, it eventually gives way to a type of cognition I call vision-logic or network-logic. . . . And it is vision-logic that drives and underlies the possibility of a truly planetary culture (p. 190-191).

The term *planetization* was coined by Teilhard de Chardin in the middle of the last century and may well be a concept whose time has come (Teilhard de Chardin, 1959/2004). Both Steiner and Gebser spoke against narrow nationalistic ideologies, which they saw as being residues of deficient rational consciousness. Gebser (1949/1985) thought that instead of being fixed conceptions, nations could be "dynamic efflorescences of a larger cultural context" (p. 291). The extensive work by Edgar Morin and others on the planetary era provide significant contributions to an understanding of this feature (Benedikter, 2007; Gangadean, 2006a; Montuori, 1999; Morin & Kern, 1999; Nicolescu, 2002; Swimme & Tucker, 2006). (See also Appendix B).

Linguistic Self-Reflection and the Re-Enlivening of the Word

The enlivening of language was unquestionably a major focus for Steiner in facilitating the birth of the new consciousness, beyond abstract rationality. Steiner (1930/1983a) stressed the need to awaken the artist in us when it comes to language if we hope in the future to be able to express our experiences of the emerging spiritual awareness.

> We have to create . . . an immediate connection between *what* we want to say and *how* we want to express it. We have to re-awaken the linguistic artist in us in all areas. . . . Each sentence will be seen as a birth, because it must be experienced inwardly in the soul as immediate form, not simply as a thought. . . . Spiritual science . . . will become capable of decanting the thought in such a way into the sound structure that our language too can again become a means of communication of the experiences of the soul in the supersensible. (p. 15-16)

Plato's *Republic,* especially the dialogues with Socrates, marked the end of poetry and image as primary ways of languaging the world, and the beginning of the formalization of philosophy as the new epistemology for the intellectual-mental-rational consciousness. In a recursive, parabola-shaped, re-integration, Gebser claims that the new consciousness is to be birthed through poetry, yet a new kind of *conscious* poetry.[231] Wilber also identifies the role of language in the new consciousness. However, unlike Steiner and Gebser, he does not emphasize the *centrality* of artistry in languaging. Clearly there are significant links here with Derrida's (2001) poststructuralism and Cook-Greuter's (2000) *construct awareness*, as proposed by Hampson (2007).

Deficient Manifestations of Integral Consciousness

As discussed earlier there is a divergence between Steiner's, Gebser's and Wilber's overall notions of deficiency or pathology in relation to movements of consciousness, which particularly plays out in respect to the current emergence. Both Gebser and Steiner referred to the gradual emergence of a new consciousness over the last five hundred years but with increasing intensity in the 20th century. They both also spoke of the growing problems of over-abstraction, egotism, fragmentation and disconnection from Spirit, relating these phenomena to an overextension of intellectual-mental-rational consciousness. Their characterizations of the new consciousness do not tend to point to deficiencies at this stage—the major concern being that the grossness of the dominant mode will override and mask the subtle appearance of the new transparency. However Gebser (1949/1985) did note in one of his charts that integral consciousness, still in its early stages, may manifest in a deficient form as "void (atomizing dissolution)" (p. 142). The associated explanation appears to connect this with the overextension and exhaustion of the mental structure rather than with the integral structure itself. He gave the following example: "'artists' . . . who are merely atomizers, surrender themselves by distorting and disjointing form, instead of rendering into form what has been placed as a task into their care" (p. 506, note 19). Gebser (1949/1985) also discussed the difficulties in attempting to present information about the integral consciousness—in the sense that it allows the originary presence to become transparent.

> Increasingly deficient attitudes seek refuge in syncretisms . . . or encyclopedic compendia . . . Presentiate wisdom becomes accumulated knowledge; when summarized and compiled, it yields a new sum, but no new wisdom. Wisdom is reduced from a quality of being to a quantity of possession (p. 44).

Wilber's approach is less consistent as he has moved beyond his earlier position where his *vision-logic* paralleled Gebser's *integral-aperspectival* and thus Steiner's *consciousness soul*. In the last five to six years he has come up with a proliferation of *structure-stages* beyond mental-rational (in the phylogenetic, cultural evolution stream) and its parallel, formal operations (in the ontogenetic, psychological development stream). In his latest publication (Wilber, 2006) he locates, between *rational*[232] and *integral,* a new stage—*pluralistic*—that he incorrectly identifies as one of Gebser's worldviews (glossy insert between pages 68-69). Based on this misappropriation of Gebser's model he further develops his conception of this pluralistic stage, which he associates with postmodernism, as a somewhat deficient, in-between stage, on the way to integral. Wilber conflates his new *integral* with Gebser's *integral* without any reference to the fact that Gebser does not include a *pluralistic* structure before integral and with very little evidential justification for his *pluralistic stage*, particularly from the cultural phylogeny perspective (Hampson, 2007). The problem here is that Wilber appears to be conflating *individual* psychological developmental stages (ontogeny) with Gebser's structures of consciousness—which are actually more in line with the current literature on *cultural* evolution (phylogeny). Given that Wilber is aware of this distinction and clearly quite familiar with the current evidence from adult developmental psychology on the existence of at least four psychological stages beyond formal operations (Commons & Richards, 2002; Commons, Trudeau, Stein, Richards, & Krause, 1998; Cook-Greuter, 2000, Torbert, 2004), it would be conceptually more coherent for him to confine himself to this research to establish his pluralistic stage, rather than attribute a stage to Gebser that the latter did not actually identify.

---

[231] In the context of Gebser's and Steiner's views on consciousness evolution, poetry as an artistic condensation of language opens the awareness to a simultaneous experience—*concretion*—of all the consciousness structures.

[232] As mentioned earlier "rational" is Gebser's term for *deficient* mental.

The Infancy of Integral Consciousness—a Macrohistorical *Re*flection and *Pro*flection[233]

> Only by realizing the new mutation as an integral bearing or attitude and not as a quantifiable "enrichment" can man preserve himself from a complete loss of what it means to be human. (Gebser, 1949/1985, p. 306)

One of the key propositions that I wish to draw from the above material is that the major movements of consciousness we have been exploring—particularly those that link to cultural shifts in the post-glacial age—appear to take approximately 2,000 years to become consolidated within human culture. These macro, time-cycles have been linked to the astronomical event called the *precession of the equinoxes* (Bocchi & Ceruti, 2002; Steiner, 1971a; Ulansey, 1994). (See Appendix A) The influence of such a long-term event-cycle can be demonstrated when we observe the historical development of the thinking that in academic discourse we take for granted. As demonstrated, this mental-rational shift only began to emerge in Greece between 600-800 BC, arguably reaching its culmination approximately 2,000 years later in Europe

If we consider that the new consciousness movement showed its first *cotyledons*[234] at the same period that the previous consciousness was reaching its peak, it becomes evident that this new consciousness, although it has been gradually emerging within leading individuals for 500 years, is only in its relative infancy. An analogy would be to compare what mental-rational thinking was like just 500 years after Plato and Aristotle compared to what it became in Descartes, Kant or Hegel. What is unique, however, about the new consciousness is that it is part of its multifaceted nature to be pluralistic, interconnected, multiperspectival, inclusive—indeed planetary—in its scope. So rather than a few leading-edge philosophers discussing ideas in

---

[233] I am using the underused term *pro*flection as a future-oriented contrast to *re*flection. *Reflect* was first used as a verb in 1402 from Latin *flecter*e "to bend" meaning "to bend back" or "turn back" the sun and not until two hundred years later in the sense of "to turn one's thoughts (back)"–first attested 1605. In honor of Gebser's sense of time concretion, my *proflection* means, "to turn one's thought forward." http://www.etymonline.com/index.php?search=reflection&searchmode=none. This also links to Future studies (Slaughter, 1999).

[234] *Cotyledons*—for those who are not gardeners—are the very first baby shoots that peek out of a germinating seed.

Plato's Academy in Athens, it is possible, through the interconnected world that has been created through advances in technology, for this new consciousness to become fully planetary in reach. If we can awaken this integral transparency, even now as it is in its infancy, imagine how much more wise, loving and creative our consciousness might be across the planet in another thousand years.

The following statement by Friedrich Nietzsche in his *Beyond Good and Evil* is as good a set of criteria as any that I have found, for evaluating how successful a new philosophy-theory-approach might be. It seems an appropriate note on which to end this section.

> To what extent is it life furthering, life supporting, species supporting, perhaps even species cultivating? (*Jenseits von Gut und Böse*, Beyond Good and Evil, ¶ 4). (Steiner, 1895/1960)

Transition to the Farther Reaches

There is an apparent major point of departure between Gebser's integral-aperspectival mode—as the culmination of consciousness development, from his view—and both Steiner's and Wilber's notions of several potential further stages/movements of consciousness—within both individual development and cultural evolution. This is a challenging, under-researched area—particularly in relation to future, general cultural evolution. I suggest the situation is not as clear-cut as it might first appear. A preliminary discussion is explored in Appendix A, under the section heading *Gebser's Integral vs. Wilber's Transpersonal Levels*. I intend to undertake further research in this area, but until such research has been completed, I consider the notion of future movements beyond those discussed here to be a very complex issue, to say the least. Suffice to say that, in my view, the most important development that needs to occur at this point in planetary time is, for all of us who are working in our various ways to nurture postformal, integral or planetary consciousness, to continue and increase our collaboration to assist the planet-wide awakening of emergent new features of consciousness.

9. Rewinding Loose Threads: Re-*mind*ing us of our *Origin*

> Reading the article once through is like walking around the base of a mountain.[235] (Starr & Torbert, 2005, p. 96)

The last stage of weaving a tapestry is to search the near-finished artifact for loose threads. It is the same with noospheric tapestries. This paper set out to facilitate a broadening and deepening of the evolution of consciousness discourse, particularly within integral theory. It sought to expose gaps in the literature and to open new questions in relation to how they might be addressed. The structure was provided by an interwoven theoretic narrative constructed from the evolution of consciousness narratives of Steiner and Wilber, in the light of Gebser's structures of consciousness. It endeavored to integrate—without syncretizing—their unique integral perspectives. Many smaller threads from other discourses were also interlaced into the narrative as I created my *theoretic bricolage*, embracing the broadest picture, enriched by the deepest meanings. This evolved into a macrohistorical journey from cosmic origins through the emergence of archaic, magic, mythical, and mental-rational consciousness and into the present time in which postformal-integral consciousness was shown to be emerging as a transdisciplinary, planetary phenomenon. Three side journeys were also taken through depth-dives into multiple conceptions of time (Appendix A); macrocosmic conceptions of space (Appendix B); and the relationship of palaeoart to the evolution of literacy (Appendix C).

I will now briefly summarize:

- **Summary of the Research**: Focus and Findings;
    - Broadening the *general* evolution of consciousness discourse;
    - Deepening the *integral* evolution of consciousness discourse;
    - *Integration* of Integral Views

- **Reflecting on the Narrators**: The Map, the Territory and the Guide. This section responds to the third research focus—*integration* of integral perspectives;
- **Reflecting on the Journey**: How Meta was the Narrative? This section responds to the first research focus—broadening the *general* evolution of consciousness discourse. It revisits the key terms in the title of the narrative;
- **Reflecting on the Language**: This section responds to the second research focus—deepening the *integral* evolution-of-consciousness discourse, particularly through demonstrating the reflexively participatory and artistic/aesthetic qualities in Steiner's and Gebser's language;
- **Epilogue**: We are Children of the Cosmos on our Way Home.

---

[235] This quote is from Starr and Torbert's (2005) recent article on triple-loop learning. Like hermeneutic circling, the reflexivity in double and triple loop learning enables deepening of understanding.

Summary of the Research—Focus and Findings

Broadening the *General* Evolution of Consciousness Discourse

There is a large body of literature on evolution theory that appears not to have heard of integral approaches to knowledge building. The preliminary meta-analysis of this literature demonstrated the following tendencies.

- *Minding the gaps and biases:* Most of the general evolution literature is biology-based, and much of it is based on a scientistic ideology—biased against epistemological and methodological approaches outside standard scientific methods. There is also premature closure on the possibility of developmental or evolutionary movements beyond formal thinking, either individually or culturally. These gaps and biases reoriented my focus on the following issues.
- *Focusing on the marginal:* Philosophical and spiritual approaches are particularly marginalized in the general evolution discourse. These perspectives are also marginalized within most of the consciousness studies research. These discourses also largely overlook the integral approach and generally avoid the critical issue of our planetary crisis—surely of evolutionary significance.
- *Theorizing beyond science narratives:* At the next level of analysis, it was found that additional literature beyond the scientific evolutionary discourse was growing, and included research from psychology, language studies, philosophy and the arts. Much of this however was still limited by disciplinarity.
- *Theorizing beyond disciplinary boundaries:* Much of the literature that emerged at this level of the search was either primarily scienced-based interdisciplinary research or transdisciplinary research, informed by integral theoretic narratives such as those of Steiner, Gebser, Sri Aurobindo, László or Wilber. This literature, overall, theorized stages or structures beyond Piaget's formal operations.
- *Theorizing beyond formal operations:* Two bodies of literature appeared on the horizon: literature that directly identified at least one stage beyond formal operations; and literature that appeared to enact such a stage, though not necessarily conceptualizing it as such. A second bifurcation within the former was between postformal psychological development and socio-cultural evolution, which were largely operating in isolation. Wilber (1996b, 1996c) wrote significant seminal material on both of these territories and furthermore proposed a new, more complex model of the discredited ontogeny-phylogeny argument. This spawned a new body of integral writing on the evolution of consciousness. However, there were still gaps.

In order to address these gaps and biases, I decided to focus on the marginalized transdisciplinary and integral literature to uncover what, if anything, may have been missing there.

Deepening the *Integral* Evolution of Consciousness Discourse

A unique feature of postformal-integral-planetary consciousness is that we can co-create it. The challenge is how to do that. Many of the gaps referred to in biologically based evolution literature or alternative single discipline approaches have begun to be addressed—quite substantially—by Wilber, followed by others, through a more integral approach to the evolution of consciousness. However, this literature too has gaps and biases, which my research has sought to address.

- *Minding the gaps and biases.* Integral research is a growing corpus—particularly in the USA—with much of it either directly or indirectly addressing the evolution of consciousness. Most of it also addresses the phenomenon of Wilber's integral theory. Regardless of whether it is embraced, dismissed or critically engaged, it is a force to be reckoned with in integral theory creating. Wilber's theory is arguably the broadest conceptually; and is extraordinarily inclusive of earlier and contemporary theorists. However, there are limitations. His omission of Steiner's evolutionary research and some of his questionable usage of Gebser's research are both addressed in this paper. Notwithstanding his conceptual honoring of the Big Three—Truth, Beauty and Goodness—much of his theoretic narrative appears to privilege cognitive development. Many other integral theorists make significant contributions to evolution of consciousness theory, yet most of their work reflects the residue of disciplinary boundaries, particularly the boundaries set up by science. Much of it is thus also cognicentric and primarily framed and presented in formal academic—rather than *postformal* styles. The following points address what might be needed to *deepen* integral theorizing beyond these limitations.
- *The marginal of the marginal:* Without intending to be tautological, I became interested in what Wilber and other leading integral theorists—themselves marginalized in the dominant evolutionary literature—had omitted or biased. In terms of people and content Wilber had largely omitted Steiner's huge body of relevant material, and had also in my view underrepresented the significance of Gebser's work in several major areas. I have demonstrated that the following two key aspects of a fully integral theory of the evolution of consciousness have been able to be addressed in significant new ways by conceptually integrating into the integral discourse Steiner's research and a closer look at Gebser's actual text.
- *Participatory engagement:* This research has identified two kinds of participatory engagement that could potentially serve to enrich the current integral theoretic narrative on evolution of consciousness. The first is via embodied reintegration of the whole person (Ferrer, Romero, & Albareda, 2005). The second is via reflexive enactment of the modalities being theorized (Hampson, 2007). My research has attempted to engage both these modes of participation and also to contribute theoretically to the importance of both. It is organized so that it reflexively enacts the theme that it addresses—movements of consciousness. It also both theorizes and enacts the integration of many parts of my *whole person*.
- *Artistic/aesthetic sensibility:* The paper also enacts vital, imaginative and spiritual—as well as cognitive—dimensions through artistic/aesthetic creativity. This is done through orienting particular sections in a particular way, e.g., Appendix C particularly focuses on the aesthetic dimension. Also I have attempted to bring an aesthetic, poetic sensibility through in much of my languaging, based on Steiner's and Gebser's claims that this is a core characteristic of the new consciousness. Other integral theorists also recognize its importance (Hampson, 2007; Neville, 2000; Roy, 2006b; Thompson, 1998).

Integration of Integral Views

The third major focus of this research—which is intimately linked with the above-mentioned points—is my passion to *integrate the integrals*. I have attempted this in several ways.

- *Integrating the theoretic narratives of Steiner, Gebser and Wilber:* In addition to deepening the narrative by balancing cognitive with participatory and aesthetic modes, the dense and difficult text of Steiner's and to a lesser extent Gebser's is balanced by Wilber's use of the *vernacular*—people can read him and understand what he is saying.
- *Providing conceptual bridges* for the interpretive communities of Steiner, Gebser and Wilber to better understand each other's approaches.
- *Providing a conceptual bridge* between discourses that directly *identify* new stage/s of consciousness (e.g., adult developmental psychology) and discourses that *enact* characteristics of that consciousness (e.g., critical theory, new sciences, process and poststructuralist philosophies).
- *Providing conceptual bridges* between the integral and postformal literature and the emergent critical literature on the ecology of our planetary crisis and the realization of its connection with the way we humans think;
- *Exploring the potential relationship* between László's Akashic *In*formation field and Steiner's spiritual-scientific research methodologies. While no conclusions could be drawn from such a cursory attempt, I have put this on the table as a future research project.

Reflecting on the Narrators—The Map, the Territory and the Guide

In her recent research on integral art, Roy (2006b) has introduced the metaphor of *gap-diving* from the map into the territory that one is researching as a way of deepening our appreciation and understanding. She also notes the gap between the AQAL integral map and Gebser's integral-aperspectival, echoing Gebser's call for a new form of statement. The following discussion reviews the approaches of our three narrators. To what extent do they map the territory? To what extent do they dive deeply into it? To what extent are we guided in our journey into new consciousness? In the following section, I will be discussing the different contributions of Steiner, Gebser and Wilber in terms of the notions of *map*—in relation to Wilber; *territory*—in relation to Steiner; and *guide*—in relation to Gebser.

The Map

> *When you discover Wilber, you discover everyone . . .*[236]

Wilber appears to provide the biggest, most comprehensive, map. His more elementary books introduce readers to vast bodies of material from a very broad range of disciplines and perspectives, and organize the information in ways that are not too difficult for the average non-academic reader to understand (Wilber, 1996a, 2000a). His more academic books provide much more depth in many areas, yet the emphasis is still on the organization of the material into maps and charts (Wilber, 2000d, 2000b). The quantity of work he has written is vast and most of it is fairly accessible. However, his depth sounding of the territory itself is lacking in some areas. There is a significant bias toward Eastern spiritualities, such as Buddhism and Hinduism, while largely overlooking major Western[237] esoteric traditions, such as Rosicrucianism, Freemasonry and anthroposophy, to name a few; and some serious distortions, e.g. postmodernism, Derrida (Hampson, 2007). Wilber refers to hundreds of original or secondary sources. Those finding his work useful as a map or guide to spiritual, philosophical or psychological territories are encouraged to consult the primary sources for a deeper understanding of the territory he maps. He also encourages his readers to go to the territory themselves.

---

[236] A comment made to me by a young man who had found the discovery of Wilber's writings to have a transformative effect on him during a period of existential angst, leading him on to the reading of many other writers.

The major focus of Wilber's books, particularly since the mid-nineties,[238] is, first and foremost, to conceptually develop and *map* the most comprehensive theoretical framework of integral knowledge and understanding of humanity, nature and Kosmos. He refers to his own work, unabashedly, as mapping. The following long quote, from the foreword to Visser's (2003) book about his work, is an encapsulation of this perspective.

> Every one of my books has at least one sentence, usually buried, that says the following: ". . . It is a sharing of what I have seen; it is a small offering of what I have remembered; it is also the Zen dust you should shake from your sandals; and it is finally a lie in the face of the Mystery which only alone is."
> In other words, all of my books are lies. They are simply maps of a territory, shadows of a reality, gray symbols dragging their bellies across the dead page, suffocated signs full of muffled sound and faded glory, signifying absolutely nothing. And it is the nothing, the Mystery, the Emptiness alone that needs to be realized: not known but felt, not thought but breathed, not an object but an atmosphere, not a lesson but a life.
> There follows a book of maps; hopefully more comprehensive maps, but maps nonetheless. (p. xv)

Wilber's integral approach has added a significant breadth of content to the evolution of consciousness narrative—much of which was scientistic and disciplinary prior to his seminal contribution through *Up from Eden* (Wilber, 1996c). He has conceptually integrated much of the 20th century Anglophone literature that was written after Steiner's death and even after publication of Gebser's *Ever-Present Origin*. He draws attention to a vast body of literature. He attempts to theorize a framework that can make sense of all the *partial* approaches—to create a genuine *theory of everything* (Wilber, 2000a). He admits that all attempts at such an integral vision "are marked by the many ways in which they fail. The many ways in which they fall short, make unwarranted generalizations, drive specialists insane, and generally fail to achieve their stated aim of holistic embrace" (p. xii). In spite of this dilemma, he appears to commit himself in every book to the "ever-receding dream" of a holistic quest (p. xxii). Also, somewhere in each book, usually in the preface or introduction, and often scattered throughout as well, he points to spiritual *territory* that he claims is *beyond words*. Reynolds (2004) cites Wilber from *A Brief*

---

[237] This may be a contextual explanation for his omission of most of the work of esoterically-informed, pioneering, integral philosophers from Europe, such as Goethe and Steiner.

[238] The major phases of Wilber's work will be further elucidated below.

History of Everything: "The task of philosophy, as it were, is not simply to clarify the maps and *correct* their deviations from reality but to *elucidate* these deeper currents from which thought couldn't deviate if it wanted to" (p. xv). Situated as he is in a context of American culture—where fast foods, accelerated learning and a general addiction to an ever-speedier pace of living is the norm—Wilber writes at a hurried pace. In his race to write he does not appear to stop and check for accuracy of details—to edit for redundancies, nor to reflect on and refine his language. That is his major weakness and perhaps also his strength. As a result he is read, loved and revered by many, but he is critiqued by many as well.

In summary, providing readers take seriously the fact that the self-declared nature of Wilber's work is to make conceptual maps, and providing readers also check his major sources for accuracy, and especially that they dive into the *territory* themselves, then his work can provide a valuable service. Alternatively, if AQAL-integral—or any other integral approach—were to take on the character of a dogma, or an ideology, it could threaten the whole integral project, fragmenting it in its infancy. But it cannot be denied that on the slowly awakening, integral-planetary path, in the hallowed footsteps quietly trodden by Steiner, Gebser and Sri Aurobindo, it is Wilber who, as the *Master of Ceremonies*, proudly introduces the integral project to the world stage in the 21st century.

The Territory

Steiner is, in my view, unquestionably the most comprehensive of the three when it comes to entering, from the depth perspective of spiritual research, into multiple fields of life in considerable detail—education, agriculture, medicine, art, architecture, philosophy, science, comparative spirituality, and socio-economic organization among others. However, a major weakness is that for many contemporary people—even highly educated, motivated researchers—he is largely inaccessible. His writing, in addition to being complex in both content and style—which he did not actually separate in the way I just have—exudes the tenor of the highly intellectual, philosophical life of late 19th and early 20th century Germany. His work covers vast conceptual and spiritual terrain but he does not simplify it with any *easy-read* guidebooks. There are no "three easy steps" to reading Steiner – it is just hard work.[239] Because of this the great conceptual treasures he has to offer may continue to go largely unnoticed to the scholars—particularly Anglophone scholars—of today and tomorrow as they have for the last century. By endeavoring to introduce him in association with Wilber and Gebser, I am hoping to lead readers to consider sourcing his primary writings. However, I think it would be helpful to approach them as if one was reading a sacred text with the type of hermeneutic sensitivity that is needed in such a case. I believe it may then be possible for the depth of the message to be transmitted.

Steiner's work, rather like Wilber's, developed through different phases.[240] From 1883 to 1903 his writing was primarily philosophical (including major writings on Kant and Fichte, as well as editing Goethe's scientific writings and helping to organize the Nietzsche[241] archives). The second phase of Steiner's work—from 1904—was devoted to the struggle to communicate the findings from his spiritual-scientific research. This is the period when he commenced his writing and lecturing on the evolution of consciousness. In this second period, Steiner's work is pre-eminently concerned with gap-diving into the territory—of the spiritual images, currents and ground, beneath and beyond the sensory world—the deeper currents that philosophy needs to elucidate as Wilber indicates above. In the following long quote, he made it clear that his communications about these matters were not mere reproductions of earlier sacred texts—although he had read and studied these—nor ungrounded metaphysical speculations, but grounded *perceptions*. In the following text Steiner (1910/1939) is arguably foreshadowing Wilber's notion of the *pre-trans fallacy*.[242] He notes the significance of the "completely conscious mind" in contrast to "autosuggestion or the unconscious." He also refers to his "clear, discerning consciousness" at every step in his process of arriving at advanced perceptions.

---

[239] Another issue to consider is that part of Steiner's approach was that it was not just about cognition and knowledge, but involved life practices—such as disciplined thought exercises, or contemplation practices, and engagement with the arts. He claimed that such practices, in addition to cognitive work through study/research, assisted the development/evolution of consciousness.

[240] The major phases of Steiner's work will be further elucidated below.

> My knowledge of things of the spirit is a direct result of my own perception, and I am fully conscious of this fact. In all details and in the wider views I have always examined myself strictly to whether I have made every step, as my perception advanced and developed, so that a completely conscious mind accompanied those steps. Just as the mathematician advances from thought to thought without the intervention of autosuggestion or the unconscious, so must spiritual perception advance from objective imagination to objective imagination without anything living in the soul but clear, discerning consciousness . . . the results of my perception . . . were, at the beginning, "perceptions" without words to designate them. . . . Later I sought in the ancient designations of the spiritual in order to find verbal expressions for what was until *then* wordless. . . .
> However, I sought *always* for the possibility of expressing myself *only after* the content I wished to clothe in words had arisen in my own consciousness. (pp. xiii-xiv)

It appears to me from this statement that Steiner is also demonstrating postformal reasoning through self-reflexivity about his process "I have always examined myself strictly;" and the dialectical term "objective imagination." A careful study of this text can leave the reader in little doubt that Steiner is speaking about a postformal reasoning process that could not easily be confused with magic or mythic processes, which he himself clearly identifies as earlier movements of consciousness. Steiner also emphasized that the abilities that he developed to perceive in this manner were not unique to him or a few individuals, but would become increasingly available to anyone who wished to undertake the necessary cognitive and spiritual development and discipline. He claimed that the epistemology that he developed and presented in his books and lectures was not in any way in contradiction to the methods of science, but in fact needed to be founded on—and yet go beyond—the rigors of intellectual thinking and the accuracy of perception of the empirical sciences.

---

[241] In the early 1890's, because of his experience with the Goethe-Schiller archives in Weimar, while editing Goethe's scientific works, Steiner was invited by Frau Foerster-Nietzsche, the sister of the ailing Nietzsche, to spend several weeks arranging the Nietzsche archives in Naumberg, After his meeting with the ill Nietzsche, and having studied his philosophical works for six years, Steiner was inspired to write a book in critical appreciation of Nietzsche's significant, yet misunderstood spiritual contribution to world philosophy (Steiner, 1895/1960).

[242] Wilber's *pre-trans-fallacy* and similar notions of Steiner and Gebser is discussed in Appendix A.

> At a certain high level of [our] cognitive power, [we] can penetrate to the eternal origins of the things which vanish with time. . . . then [we] can *see* in events what is not perceptible to the sense, that part which time cannot destroy. (Steiner, 1904/1959, p. 39)

The deeply spiritual nature of his work did not sit well with the materialistic current of his times. Although there were many academics and professionals who were inspired by his work and applied it to numerous practical fields of life—including education, agriculture, medicine, science, psychology, architecture, and all the arts—like Wilber, he was critically attacked from many quarters.[243]

In summary, Steiner dived into the *territory* itself, and in contrast to Wilber, he did not spend time or energy providing maps of it or of his work. His intention was to be true to the *invisible* worlds he tried to represent and he admitted frequently that "only a faint conception of this chronicle can be given in our language" (Steiner, 1904/1959, p. 39). He proposed that we need to develop new language which is not so bound to the sensory world, and which can rediscover the *Spirit of language* in all its living force.

> The very words and turns of phrase in themselves take on something of a spiritual nature. They cease to be mere signs of what they usually 'signify' and slip into the very form of the thing seen. And then begins something like living intercourse with the Spirit of the language. (Steiner, 1929, p. 1)

This statement, especially the second sentence is remarkably similar to the sensibility of Derrida's deconstruction of language (Derrida, 2001). A question for further research concerns the extent to which some of Steiner's work foreshadowed poststructuralism. There are also clearly important connections between Steiner's words and Cook-Greuter's postformal stage that she calls *construct aware* (Cook-Greuter, 2000). Significant theoretical connections have recently been made between Derrida's deconstruction and Cook-Greuter's *construct aware* stage (Hampson, 2007).

And yet, there is no question that without a *guide*, his spiritual findings in their written forms are challenging for many readers today.

The Guide

Gebser's writing also developed across two major phases: the first phase being primarily artistic, the second cultural-philosophical. This unique development has led to the seamless infusion of artistry into the text of his philosophical work. His major contribution to this narrative has a mediating flavor to it. His obvious temporal mediation between Steiner and Wilber is an elegant metaphor for a deeper, less tangible, mediation between them. Steiner's focus is the *territory* beyond Kant's knowledge barrier, with little cartographic assistance on the long and arduous journey to the perceptions he describes. By contrast Wilber's focus is to *map* the multiplicity of components—rarely entering the deeper territory—in some ways upholding the Kantian split between his different writing styles. What Gebser offers is something in between these two rather extreme emphases. He unquestionably dives deeply into the concrete particularities of phenomena, providing thick descriptions of the structures of consciousness he identifies. However, his cultural philosophy of consciousness, although complex and challenging to read, is also structured in a way that does provide guidance to the reader. He takes a systematically layered approach to unfolding the development of each structure and also provides much additional information from many different perspectives in order to gradually deepen the understanding. His *Ever-Present Origin* is a uniquely structured book as it can be read in many different ways. It seems to express the spherical nature of integral-aperspectival consciousness itself. It is my observation that Gebser succeeded, not only in formalizing and exemplifying a new consciousness through his numerous examples across most fields of knowledge, but also, in providing a new model of how to write integrally. He managed to balance the rigorous scholarship required to stand firmly in the 20th century academic context with poetic artistry to reveal the potential vitality, imagination, conceptual direction and spiritual awareness that awaits us in the coming times as we awaken into integral consciousness.

---

[243] As well as threats on his life from the National Socialist Party, from which he had to escape to Switzerland, his first magnificent architectural creation—the first Goetheanum—which took ten years to build—was burned to the ground by arson just before its completion in 1922. It was suggested by those close to him that he never recovered from the shock of this attack and died three years later at 64, still in the prime of his life's project.

> Since our insight into the energies pressing toward development aids their unfolding, the seedlings and inceptive beginnings must be made visible and comprehensible. (Gebser, 1949/1985, p. 4)

Summary

Whereas Wilber's comprehensive mapping spearheads a popular movement towards a more integral approach to everything, his glossing over details in some of his texts needs to be balanced by the reader's own deep dives into the territory he maps. Whereas Steiner's deep, insightful dives into spiritual wisdom can be found across dozens of books and literally thousands of lectures, it can be a lifetime's work to interpret and cohere his major contribution to a topic such as we are discussing here. Gebser, however, provides sufficient structure for the reader to become conceptually oriented, while also diving deeply into each of the major territories that he has chosen to elucidate.

Reflecting on the Journey—How Meta was the Narrative?

In our current era that must contend with the deligitimation of the grand narratives of modernity, we are left with few options for providing new narratives of hope for our children and our future. We may continue to cling to old undeconstructed metanarratives in a traditional, mythic manner as if the great German and French philosophers, such as Nietzsche, Lyotard and Derrida were irrelevant. We may extend our rationality into rationalization, creating new *reconstructed* metanarratives, arguing that they are bigger and better and more reconstructed than either modernity and postmodernity has on offer. We may throw out the threading of narratives altogether, pluralize our perspectives, and allow each particularity to speak of its own uniqueness. Or we may, as Whitehead, cited in Gare (2002), recommended, "produce a variety of partial systems of limited generality" (p. 49). I have chosen to opt for the latter, not in a syncretizing way that would homogenize their differences, but rather to dive into their unique particularities. By bringing them into conversation with each other, through a hermeneutic *merging of horizons*,[244] the commonalities authentically disclosed themselves—as unity in diversity. By keeping close to the actual text of the narrators, and engaging in thick description, a type of noospheric ethnography emerged. By thus slowing down the pace of my analysis, I have thwarted any tendency to rush into abstraction or quick generalities, or to manufacture a perfectly synthetic product. I have enjoyed the individual idiosyncrasies of content, style and texture, as if each bump and wrinkle were a sign that this tapestry is indeed woven of noospheric raw silk.

How Macrohistorical? Concretion of Time—Reintegrating Appendix A

According to Gebser, his notion of *concretion in time* is a core characteristic of integral-aperspectival consciousness. It is a difficult concept to grasp, hence the decision to attach a rather extensive appendix on its explication. (Much of the conceptual discussion of time is explicated in Appendix A). This narrative has sought both to scan vast time periods and also to draw particular attention to different conceptions of time. It has first expanded time by stretching it back to its earliest beginnings and secondly it has condensed time by demonstrating that ancient times can be re-experienced and future times can be sensed in a concretion of consciousness, once one moves beyond linear, mechanical time. Through discovering Gebser's attention to time, I was also drawn to investigate Steiner's and Wilber's conceptions of time. This research has greatly deepened my own understanding of time, which I have endeavored to communicate. More research on the relationship of this notion to other features of postformal thinking is suggested.

How *Planetary*? Concretion of Space—Reintegrating Appendix B

Gebser claimed that the concept of space became increasingly more significant throughout the establishment of the mental-rational mode of consciousness and that it has been over-extended at the expense of awareness of time. An ecological view of space has been presented in Appendix B that begins with a recognition of traditional unitive conceptions of the place of humans in the cosmos, notably exemplified in the Hermetic aphorism "as above, so below." This is contrasted with the more abstract conceptions of space arising from the intellectual-mental-rational mindset especially since the Copernican revolution. The exploration and gradual dominance of the spatial dimension of the earth is shown to have progressed through various stages, such as colonization and globalization. The recent privileging of exploration of *outer space* by modernist science is contrasted with the attention on *inner space* of integral conceptions. The significance of cultivating noospheric diversity is highlighted. A number of cosmo-centric concepts are discussed as a way of raising awareness of the larger spatial ecology—in particular, a more cosmopolitan approach to integral theory is proposed as a safeguard against Anglo- and ethno-centrism.

---

[244] *Merging of horizons* was a phrase coined by hermeneutic philosopher Hans Georg Gadamer (1960/2005, 1986a, 1986b).

Was it a "Beautiful Tapestry of Integral Intent?" Palaeoart Art as Language—Reintegrating Appendix C

> When vision-logic matures into its middle and late phases, pluralistic relativism increasingly gives way to more holistic modes of awareness, which begin to weave the pluralistic voices together into beautiful tapestries of integral intent. Pluralistic relativism gives way to *universal integralism.* (Wilber, 2000d, p. xi)

Inspired by this quote of Wilber's I have endeavored "to weave the pluralistic voices" of Steiner, Gebser, Wilber and others into a "beautiful[245] tapestry of integral intent." Gebser connected the magic consciousness structure with the emergence of the early artistic abilities of humans, claiming that the early forms of cave-art were an expression of magic consciousness. Steiner's narrative also emphasizes the importance of the artistic/aesthetic dimension of human nature—both in terms of early history and also, like Gebser, as a core characteristic of facilitating the development of new movements of consciousness. Wilber honors its importance in theory, but his approach does not give it the priority given by the others—particularly in relation to emergent consciousness. Appendix C is intended as a cursory glance at some of the implications of re-examining aesthetic sensibility in the origins of human consciousness. My overall narrative style has also privileged artistic/poetic writing at times over more formal styles. Consideration of the reintegration of poetic sensibility into integral academic writing is an area for future research. My conclusion is that an increased theoretical focus on the artistic *history*—and *futures*—of humanity may throw additional light on the evolution of consciousness.

How *Fascinating* was the *Narrative*? Reintegration of Myth through Theoretic Narrative

Gebser proposed that the mythic imagination was the predominant quality of what he called the mythical structure of consciousness, which preceded the emergence of the mental mode. The major component of this paper is a long, epic, cyclical narrative. It has been woven from textual material from the three narrators, that has been interwoven with relevant academic threads. A great deal of imagination has been required on my part throughout this research to hold all the pieces of the three narrative threads together in my imagination while creatively weaving them into the larger narrative. This process required far more than a pre-rational imagination. It also required considerable mental, conceptual effort to develop a structure of academic value as well as general interest; to discern and evaluate their connections—or disconnections; to keep the narrative on track; to decide which additional literature to include/exclude; and particularly to evaluate my whole process at the end. This process has clearly enacted an integration of mythic consciousness with mental-rational consciousness at the next recursive level. Such an integration suggests Geber's *integrality*, Steiner's *Imagination*, and Wilber's *vision-logic*. I propose that the cultivation of imagination could play a larger role in integral academic writing, providing the energy for creating new narratives for our futures. It has certainly been a fascinating journey for me, but whether it has for you—the reader—is now out of my hands.

---

[245] I have attempted to introduce where appropriate into this extended academic research project an aesthetic sensibility, without—I hope—falling too far into the baroque excesses of some forms of ludic postmodernism.

Summary: How Integral? Did it Shine?

From a formal perspective the narratives of Steiner, Gebser and Wilber on the evolution of consciousness could be seen as rival integral schemes. I have attempted to show how the honoring of all three in their uniqueness can actually strengthen rather than weaken the entire integral project. Wilber is an excellent starting point for those seeking for something more than the fragmentation, shallowness and materialism of the current globalizing *monoculture,* pointing them to more integral, holistic perspectives. His maps provide pointers to a vast territory of research. Those who seek to go deeper would discover great riches by reading the original texts of the key sources that Wilber builds on: especially Gebser, but also Whitehead, Teilhard de Chardin and many others. However, an even greater depth of insight into the spiritual territory that underlies the recursive-progressive movements of consciousness is just waiting there—considerable effort not withstanding—for those who venture into the challenging waters of reading first-hand, Steiner or Sri Aurobindo. I have substantially brought together into academic conversation, for the first time, three outstanding contributors to the evolution of consciousness—who never met in real time. Their writings have, for the most part, been seriously marginalized by the mainstream, Anglophone, academic world, and it is to be hoped that this travesty is beginning to be transcended.

Reflecting on the Language—Transition from Steiner to Gebser to Wilber

In bringing this paper to a close, I now wish to reflect on the challenge for all four authors (including myself) of appropriately languaging our characterizations in a way that succeeds in communicating the flavors and textures of new ways of thinking—without succumbing to the limitations of the dominant academic mode. The narrative has demonstrated a contentious perspective that *Spiritual Presence* has been part of the very fabric of the human story from our birth out of mysterious cosmic circumstances, to our current emergence into a more conscious, self-reflective, spiritually aware, postformal-integral-planetary consciousness. In spite of whatever cultural, linguistic, historical, gender or other opacities we may be shadowing, each of us—Steiner, Gebser, Wilber and myself—in a unique way strive to render our sense of *Presence* transparent—through interweaving images, concepts and integrations—into words and sentences, articles and books. The following sections are my summary evaluations of how well each has succeeded, based on the research presented in this artifact. I propose that the linguistic task is to attempt to embody the features of the new consciousness in the actual language used to speak about it. There are arguably several challenging hindrances to a deep, authentic communication of the new consciousness movement(s) both within and outside the Academy. While the broader academic context is still largely formal, secular and dominantly scientific, the broader culture of the day is pragmatically geared to poli-speak, edu-speak, sport, *reality* TV shows and sound bytes. How do we create the new languages required to intensify our consciousness in such extreme contexts?

Gnothi Seauton: "Know Thyself," From Three Voices

I propose—based on my hermeneutic analysis—that there is a transition in linguistic expression between Steiner, Gebser and Wilber, perhaps reflecting the larger cultural contexts. Before discussing the language of each in more depth, I will demonstrate the differences in their languaging styles through three fragments of text referring to the same information: Steiner in 1914, Gebser in 1949, and Wilber in 2000. Each refer to the famous inscription *gnothi seauton*, "*Know thyself*," on the temple of Apollo in Delphi as being a significant marker of the new intellectual-mental-rational consciousness emerging at that time. Let us begin with Steiner's (1914/1973) considerations.

> This ancient oracle wisdom speaks as if it contained the challenge for the progress of world conception that advances from the conception in images to the form of consciousness in which the secrets of the world are seized in thought. Through this challenge man is directed to his own soul. . . . The leading spirits of Greek civilization . . . were to develop thought in the soul into a world conception. (pp. 33-34)

Steiner's words are pre-eminently philosophical—dense, weighty, yet imaginative. It is possible to sense that he is picturing a grand vista of images in which the inscription is a deep cryptic riddle. He speaks with reverence and awe of the significance of this event to the inner development of human conceptions of the world—from images to the activity of thought. His voice is careful, heavy with responsibility. Being the first in his times to speak openly about the evolution of consciousness, he strove to communicate what was still veiled to the world.

Three to four decades after Steiner, Gebser (1949/1985) referred to this same Delphic inscription as an exhortation to emergent mental-egoic consciousness.

> The lapidary sentence gracing the temple of the sun god, itself a manifestly spatial articulation of singing columns and stones, even today has lost none of its vitality: *gnothi seauton*, "Know thyself." (p. 78)

Gebser's languaging is pre-eminently poetic—artistically enacting integrality. The dialectical phrase "lapidary sentence" sets the artistic-conceptual tone, with every subsequent word chosen for its poetic resonance. His philosophical message is transmitted within the artistry rather than "explained." He confidently captures, condenses and integrates magic vitality, mythical imagination, mental direction, and concretion of time—his words shining with originary presence. My interpretation is that he is enacting a subtle linguistic *evolution* of Steiner's message and style.

Now we will fast-forward another fifty years to the other side of the Atlantic Ocean to see what Wilber (2000d) has to say.

> From Socrates' Delphic: "Know thyself" to the exhaustive introspections of Hume and Locke and Descartes and Kant (and Nagarjuna and Garab Dorje and Chih-I and Fa-tsang), the common theme heard over and over and over again: look within. (p. 184)

Wilber's languaging is pre-eminently pragmatic—prosaic, direct, syncretic. This is a "no frills" statement of a message he seems tired of repeating. He uses a characteristic style[246] of listing numerous philosophers—east and west—who have gone before him apparently making similar points. His voice seems to reflect the tone of his culture, where an over-extended rationality seems to have squeezed out and exhausted: vitality, imagination, and the shine of spiritual presence—leaving an empty, echoing, pointing-out instruction—21st century American Zen perhaps?

---

[246] Although this is one of Wilber's typical styles he does have other more philosophical and also more poetic/spiritual writing styles as will be demonstrated below.

A Broader Overview of Language Styles

Steiner

As demonstrated throughout the paper Steiner's language style overall is very deliberate, particular, and for the most part, quite verbose and labored. Because of the intensiveness of his spiritual-scientific research over decades, he lived in two parallel worlds: his inner world of perception of the *Akashic* information field and the physical-life-world where he worked tirelessly to communicate his research. His writing is a continuous, mostly seamless, dialectic between his knowledge of human qualities, world events and nature, and his deep spiritual insights into the invisible currents behind all this. His language is always a careful and conscious struggle to bring through these insights, conscious that from the perspective of the highly materialistic cultural context that he inhabited, those inner worlds that he himself claimed to have experienced were either regarded as *non-existent* or were dualistically bracketed—in the Kantian sense—as *unknowable*. His endeavors—through his lectures and writings—received mixed responses. At his death he believed he had failed. To this day his enormous contributions to the integralizing of the noosphere have been largely overlooked in academia, arguably because of the esoteric content and relative opaqueness. It is worth noting that in addition to his cultural philosophical and spiritual-scientific writings, Steiner was also a poet, playwright, and visual-sculptural-architectural artist. To my observation there remained a degree of differentiation between his philosophical, his spiritual-scientific, and his poetic writings. However, much of the text used in this research is a modified philosophical style used to assist in presenting the results of his spiritual research. This style is exemplified in the following example.

> The deepening of knowledge depends on the powers of intuition which express themselves in thinking. In the living experience which develops within thinking, this intuition may dive down to greater or lesser depths of reality. . . . But under no circumstances should this diving down into the depths to reach reality be confused with being confronted by a perceptual picture of greater or lesser breadth, which in any case can only contain half the reality, as determined by the organization of the cognizing being. (Steiner, 1894/1964b, p. 105)

The following fragment is an example of his poetic style.

> So I will turn my heart and mind
> Toward the Soul and Spirit of words
> And in my love for them wholly
> Experience myself.

I hope through this paper to have achieved in a small way a clearing of the opacity of some of his writings, an unveiling of the integral intent of his work, and an opening up of his significant potential contribution to the 21st century noospheric conversations. By bringing Steiner's words into hermeneutic conversation with Gebser's, Wilber's and my own, my intention is to render transparent the wealth that still lies—largely hidden—within.

Gebser

The transition from Steiner to Gebser is a wonderful example of how a relatively short chronological time can mark a dramatic movement in the noosphere. Between the first appearance in 1904 of Steiner's seminal essays and lectures on the evolution of consciousness (Steiner, 1904/1959, 1986a), and the first German publication of Gebser's key work in 1949, the evolutionary writings of Bergson[247] (1911/1944) and Sri Aurobindo (1909, 2000) had also appeared. The rich cultural, philosophical and spiritual flourishing of the first two decades of the 20th century has been documented by Tarnas (2006, p. 362, 401). Gebser appears to have drawn on this material, either explicitly or intuitively[248] in his detailed exposition of the new consciousness structure. He had also immersed himself in a deeply artistic culture in early 20th century France and Spain and was already a published poet before beginning his work on structures of consciousness. Gebser's writing, rather like Steiner's is deliberate, particular, and dense. His scholarly attention to detail and endnoting suggest great care and, like Steiner, a similar struggle to reconcile the original spiritual presence—the ever-present origin—with the drive to communicate what he calls his *a-waring-in-truth* or *verition.* Gebser's (1949/1985) unique claim is that in order to fully enact integral consciousness one needs first to consciously experience all the previous structures.[249] Through the nuanced prose-poetry of much of his writing, he succeeds in bringing the uniqueness of the structures to our awareness, not just through concepts, but also right into the fabric of his language—through the intensified consciousness of every word.[250]

> Just as every person represents and lives the entire mutational sequence of mankind through his structures, so too each word reflects its mutational exfoliation within language itself. . . . the original meaning . . . is still luminous throughout the unfolding changes of

---

[247] The point here is not to suggest in some kind of competitive manner that Steiner was first to discover or invent these ideas—as occurs in many scientific discoveries. He was always careful to draw attention to the genealogical lineages of his own concepts and those of others—ideas often going back thousands of years, and yet taking new form, transformed by time and history. In this light he (Steiner, 1914/1973c) points to the earlier philosophical lineage behind the following claim of Bergson in Creative Evolution: "It is as if a vague and formless being, whom we may call, as we will, man or superman, had sought to realize himself, and had succeeded only by abandoning a part of himself along the way . . . the animal world, and even the vegetative world" (p. 423). Steiner said that this thread can be traced back to Nietzsche's notion of the *superman*, as paraphrased by Steiner, "The animal bore man in itself; must not man bear within himself a higher being, the *superman*?" (p. 409). Steiner also noted in some of his earliest lectures on evolution of consciousness (Steiner, 1986a) that the genealogy of these ideas could even be traced back to the hermetic scientist Paracelsus (1493-1541). Paraphrasing a key idea of Paracelsus, in regard to how he viewed the animal world: "I carried all that within myself and cast it out from my own being" (p. 72).

[248] See introductory section for note on Gebser's "flash-like intuition" that inspired his research for the next 17 years on this topic.

[249] A similar point has been formalized by developmental psychologist Robert Kegan (1994).

[250] This appears to relate to what Hampson playfully calls *nanotextology* (Hampson, 2007).

> meaning taken on or attributed over the years. Every word, after all, is not only a concept or a fixed equivalent in writing; it is also an image and thus mythical, a sound and thus magic, a root and thus archaic, and thus by virtue of this root meaning, still present from origin. . . . If we remain cognizant of this origin and employ the words in a manner that manifests their integrity, they will at least lend the luster of the wholeness to those phenomena which they denote. Then, too, our sense of hearing, our heart, and our mind must be equally awake. (pp. 123, 127)

My evaluation of his cultural philosophical writing is that he largely achieves an enactment of integral consciousness, as he understands it. He both characterizes and enacts the structures of consciousness. In my view he has, inadvertently, continued Steiner's project though in a more finely interwoven, subtly nuanced manner as demonstrated in many examples throughout this paper. However, like Steiner, Gebser is not widely read or cited in the Anglophone academic world, and may also be challenging to read for many non-European contemporaries, including academics. His original text[251] is far more than its content.

Wilber

There are two major transitions that occur between Gebser's and Wilber's writing, one temporal and one spatio-geographic. It is interesting to note that the cultural flourishing that occurred between Steiner and Gebser does not appear to have carried through directly into *our* times. There is little doubt that it was sabotaged by the two world wars. The misuse of evolutionary metaphors and abuse of espoused spiritual knowledge by the Nazis cast a pall over European notions of spirituality and also evolution, development and progress. In core Europe,[252] German critical social theory was followed by French postmodernism and deconstruction. These could be interpreted[253] as attempts to clear the decadent residues of the previous structures of consciousness where remnants of old mythic consciousness lingered in the metanarratives of religion and science, and deficient rational thinking was overextended in the secular ideologies of scientism and economism (Benedikter, 2005). When French postmodernism took root in noospheric soil in the USA, it appears to have hybridized with other aspects of North American culture such as a reduced form of pragmatism, consumerism, and a lifestyle-culture that seems to parallel a superficial, non-contemplative, appropriation of ideas for its own ends. Wilber seems to scapegoat postmodernism as the cause of many of the problematic aspects of North American culture, rather than seeing the type of postmodernism that evolved there as being a reflection of the shallowness of the surrounding cultural context.[254] Wilber's writing can also be seen as reflecting different phases and also different styles within those. His earlier writing, prior to SES, established him as something of an authority on transpersonal issues. He caught the 70's wave of idealistic new ideas on consciousness, spirituality, feminism, eco-romanticism, and East-West integration. He tackled these with vast quantities of research, a fairly traditional academic style, a powerful intuitive vision and a great deal of optimism (Wilber, 1977, 1990, 1996b, 1996c). His book *Eye to Eye* (Wilber, 1990) is full of such writing. Referring to the writings of St Bonaventure the Christian mystic, he identifies:

---

[251] Of course, both Steiner's and Gebser's writings have been translated from the German, which I have not had the pleasure of reading. Undoubtedly there are also subtle nuances that have been lost in the translation.

[252] Core Europe is a term used philosophically to refer to French and German philosophy (Benedikter, 2005).

[253] This is my interpretation of Benedikter's philosophical analysis of the late works of several—mostly French—postmodern philosophers, whom he indicates were reaching beyond deconstruction to a *productive void*, pointing to a new postmodern spirituality.

[254] For more on the Americanization of postmodernism in Wilber's integral see Hampson (2007).

> *The eye of flesh*, by which we perceive the external world of space, time and objects; *the eye of reason*, by which we attain a knowledge of philosophy, logic and the mind itself; and *the eye of contemplation*, by which we rise to a knowledge of transcendent realities. (pp. 2-3)

He concludes this section with the optimism characteristic of his earlier writings.

> We of today are in an extraordinarily favorable position: we can preserve the utterly unique position of possessing and championing a balanced and integrative approach to reality—a "new and higher" paradigm—one that can include the eye of flesh and the eye of reason and the eye of contemplation. (p. 37)

From the perspective that I am viewing language here—that is, with an emphasis on style rather than content, his writing could be viewed in two more phases.[255] From the time Wilber (2000d) started writing again after what he called his "ten-year writing hiatus"[256] (p. ix), he underwent a major period of academic creativity during which he made significant contributions to the enriching of integral theory (Wilber, 1996a, 1998, 2000a, 2000b, 2000c, 2000d, 2001a, 2001d). He noted that, in the ten-year intervening period "extreme postmodernism had rather completely invaded academia in general and cultural studies in particular" whereby he felt constrained by not being able to use terms such as "development, hierarchy, transcendental, universal" (Wilber, 2000d, p. ix).[257] Although he honored what he saw as the very important truths of postmodernism—constructivism, contextualism, integral-perspectivalism, pluralism and multiculturalism—which he claimed were driven by *vision-logic*—he nevertheless expressed anguish, anger and sadness at what he saw as "the shallowness that pervades postmodernism" (p. xxiii). This feeling expressed itself as a new polemical style that seems to have pervaded much of his writing since then. In his own self-reflection he noted this new development, "in all of my first twelve books, stretching over two decades, there is not a single polemical sentence" (p. xxiii). He then argued that a "little polemical rattling" was a necessary challenge, given that "these ideas had been studiously ignored for decades" (p. xxiv). Nevertheless, his writings during this next phase—up to the early 2000s—were vast in their reach, containing a substantial quantity of research across a wide vista of knowledge areas. His writing stimulated considerable discussion and research in transpersonal psychology, and numerous fields of research that he endeavored to integrate under *integral studies*. The main style for these works—exemplified in *SES*—is an easily readable narrative, interweaving a vast range of areas of research, much of it documented with copious endnotes, threaded together with polemical argument and rhetoric. Using his method of orienting generalizations, he includes many broad syncretic statements such as that quoted in the section above about the Delphic Oracle. His work seems to achieve a relative simplification of many complex concepts, by using fairly plain language, repetition, and emphatic stylistic gestures in order to introduce his ideas to a wide readership, as much outside, as inside, the academy. In this phase, his writing can be persuasive and emotional, thus drawing extreme responses of sympathy or antipathy. The following emotive statement discussing the "Enlightenment mind," is fairly typical of this style.

---

[255] This is not to discount the perspective that Wilber takes on his own writing in describing it as Wilber 1 to 5. However, these stages appear to refer primarily to the development of the content of his writing rather than the style. I would like to especially acknowledge the contribution of Hampson's notion of *nanotextology,* and the many hours of dialogue we have shared on this, to my deeper understanding of this content/style distinction within language.

[256] During this period the only book that he wrote was *Grace and Grit,* the story of his young wife Treya's death through her struggle with cancer.

[257] I propose that this attitude of Wilber's is largely a misunderstanding of a key message of the French postmodern impulse. It is not so much that you can no longer use words like "development, hierarchy, transcendental, universal," but rather that one has to work much harder conceptually to contextualize just *how* one is using them.

> So the way up—any form of Ascent beyond Reason—was viewed as not just a bad idea, but as a literal crime against nature, a crime *against* the Great Chain and its allotted spot for men and women. . . . The theme of the modern age thus became . . . do not look up, do not transform, but follow downward-looking Science . . . The two paths of Ascent and Descent at this point had utterly and totally separated, dissociated, divorced, anemic and fractured, with no point of contact, no point even of discourse, let alone integration. (Wilber, 2000d, p. 424)

By contrast with the above polemical rhetoric, he periodically intersperses his arguments with a more poetically flowing style, generally when he speaks about spiritual matters.

> The integral vision, having served its purpose, is finally outshined by the radiance of a Spirit that is much too obvious to see and much too close to reach, and the integral search finally succeeds by letting go of the search itself, there to dissolve in a radical Freedom and consummate Fullness that was always already the case, so that one abandons a theory of everything in order simply to be Everything, one with the All in this endless awareness that holds the Kosmos kindly in its hand. (Wilber, 2000a, p. 141)

Following the publication of several books around the turn of the 21st century, Wilber seemed to go into another, shorter, publishing hiatus.[258] Between 2000 and 2006, his writing was only published online as a series of Extracts. Much of this writing, while beginning to formalize important new dimensions to Wilber's integral theory—particularly his contribution of *integral methodological pluralism*—is somewhat informal, and underdeveloped from an academic[259] perspective. These pieces mostly speak with an authoritative voice without apparent need to provide sources. Not as well researched or referenced as his earlier writing, *The Extracts*, overall retain the more rhetorical, polemical style of the second phase (Wilber, 2005a, 2005b). This style has also carried over into his latest book (Wilber, 2006).

---

[258] Much of Wilber's time and energy in recent years has been focused on overseeing the plans to apply his theoretical work into a number of disciplinary fields through his Integral Institute and planned Integral University, notwithstanding also his serious health challenges.

[259] By *academic* here, I do not merely mean a *straw man* modernist or postmodernist academic, but a well-researched, accurately sourced, thoroughly integrated, postformal integral academic approach. Some attention to this before publication of these extracts would have lent much greater support to his whole project. A lack of attention to scholarship in these later works does not assist the collective undertaking of deepening the entry of integral consciousness into the academy on a planetary scale.

Finally, it seems to me that most of Wilber's writing points to his commitment to an ascended spiritual path which has both dualistic and linear components until it reaches its ultimate stage of non-dual. In my view, this ascended theme, lends to his integrality a strongly conceptual orientation, rather than an artistic or participatory emphasis. There is also a marked stylistic divergence between his more philosophical and more spiritual writings, perhaps reminiscent of the Kantian differentiation between philosophical reason and the *unknowable*.

Summary

The above analysis indicates a major tension in adequately communicating insights into the complexities of the emergent consciousness. The two poles of the tension are:

- The struggle to be accurate and authentic to the voice of the new facets of consciousness that are emerging; and
- The desire to be understood by a worldly context that is insufficiently familiar with what is being communicated.

While Steiner and Gebser have clearly emphasized the former, this has led to their writing at times being obscurely dense, and thus not being widely read or comprehended. They have thereby compromised their readership and popularity, most probably as a conscious choice. Steiner's position is that it is the *actual effort* that is required to read difficult spiritual and philosophical material that brings about the transformation. Wilber, on the other hand, has opted for what may be called a path of least resistance. His emphasis appears to be on reaching and communicating with the widest possible audience thus his stylistic focus is on making the most difficult concepts appear simple and easy to grasp. A notable example is Extract G: Part 1: *Introduction: From the Great Chain of Being to Postmodernism in Three Easy Steps* (Wilber, 2005b). In this way, Wilber's compromise is with the detail and accuracy of the *territory*, much of which cannot be adequately conveyed through such over-simplification. From my viewpoint, it would appear that Gebser has most successfully achieved a balance of the two poles of authentic integrality of style, and readability. Yet not everyone would agree.

How do I evaluate my own languaging? Having reached a view that Gebser's writing reflects an advanced model of integral consciousness in its very texture, I have been inspired to develop my own writing with a similar balance of content and artistic style. My intention has been to write in a style that not only clearly conveys the conceptual content of what I want to say, but that is also life-enhancing, imaginative, and transparent. I will have to leave it to the reader to fully evaluate how successful it has been. But I will finish here with a few lines of self-reflection. In relation to my choice of metaphors, I am aware that terms, such as *evolution*, *progress*, *growth* and *development,* commonly used in Steiner's time, were later problematized, and even avoided, by Gebser in his writing about consciousness, as a result of their misuse during the excesses of early 20th century Europe. As discussed previously, Wilber's response was to discuss the objections and critiques of cultural evolution metaphors, then to reintroduce them in his reconstructed manner. I have attempted a different approach, drawing on my authentic experiences and observations as a mother and an educator. While not denying the socio-cultural abuses related to the unilineal, Eurocentric framing of the notions of *progress* and *development* in late modernity, I seek to recast them in organic-collaborative rather than hegemonic-economic terms. As a whole people on a whole planet we could progress and develop, not just economically but psychologically, emotionally, socially and spiritually. I also wish to reconnect the notions of *growth* and *evolution* with their biological-metaphoric roots. In the context of our only planetary home in crisis, it is vital to emphasize life-enhancing metaphors—rather than mechanistic, technicist or digital metaphors. I have witnessed first-hand with children the life-creating processes of growth and development—the unfolding of life and consciousness—in all its uniqueness and universality, its complexity and its poetry. In this paper, I have sought to honor metaphors of birthing and nurturing of new life; of co-creating; of artistically inspiring and guiding; of encouraging—and challenging—the noospheric integral conversation. So here I sit: weaving warm, colorful tapestries to nurture the crowning infant of integral consciousness; loving *all* the children who express it; and, with reverence for the fullness of Cosmic time, holding a hand-cupped candle in the wind—to guide the stragglers home.

Epilogue—We are Children of the Cosmos on our Way Home

> In actual fact the same inner connection once existed between the Earth and the neighboring Cosmos as that between an unborn child with the body of the mother. (Steiner, 1973b, p. 54)
>
> The earth is not just a star among other stars but a star *with* other stars. Any sweeping changes on earth . . . not only occur "here" (on earth) but also "there." (Gebser, 1949/1985, p. 297)
>
> Kosmic evolution is now producing theories and performances of its own integral embrace. (Wilber, 2000b, p. 194)

This narrative began with our earth being born out of our solar system, galaxy and universe, which László says was birthed from a Metaverse—the mother of all universes: the ever-present origin perhaps? This points the way to a return, not as a going back to a lost paradise but, as Morin (2005a) suggests, to a *retro-meta* re-creation—a recursion that re-integrates all previous revolutions. "Within the irreversible and disintegrating movement of time, RE constructs a rotating time that is reiterative but eventually progressive" (p. 262), or as Gebser suggests "a sphere in motion."

As indicated above, Steiner wrote almost a century ago, that life on earth is intimately bound up with cosmic processes. Gebser and Wilber also noted the intimate relationship between the earth and the cosmos/Kosmos. As we transition from formal, instrumental, ego-mentality and begin to awaken to new vital-organic, imaginative, postformal, spiritual understanding of life on earth, our concepts of the cosmos will begin to transform as well. A wonderful beginning is being made on this process in Edgar Morin's discussion of *cosmosophy* (De Siena, 2005). (For more discussion on cosmosophy, see Appendix B) In an integrative, poetical image, Morin places his ecological philosophy of human and earthly existence firmly within a living Cosmic context, re-minding us what life is. It is a recursive echo of Steiner's quote above.

> The transformation of a photonic stream born from sparkling solar vortices [in which] we living, and as a consequence, human children of waters, of the Earth, and of the Sun, are twigs, if not fetuses, of the cosmic Diaspora, crumbs of solar existence, a tiny sprout of earthly existence. (De Siena, 2005, p. 422)

Acknowledgements

I am indebted to my close friend and fellow postformal researcher, Gary Hampson. In addition to our inspiring, de/re/constructive hermeneutic dialogues, Gary has provided invaluable editorial support, both conceptually and technically. I wish to thank my son, Jesse Hunter, for reading and commenting on all this work at various stages of completion. As a new graduate in Anthropology and International Development he has kept me critically in check in these domains. I would also like to thank the editors of *Integral Review*, particularly Jonathan and Sara for their challenges, encouragement and patience; and the anonymous external reviewers for their constructive feedback. I wish to acknowledge and thank Robert Bednarik, Director of the *International Federation of Rock Art Organizations*, for permission to use several of his copyright images (Figures C1-C8); and for critically reading Appendix C in an earlier form, correcting factual errors and suggesting several points to improve the veracity of my text. Any remaining errors are of course my responsibility. Finally I wish to acknowledge and thank Peter Damerow, research scholar at the *Max Planck Institute for the History of Science*, Berlin, for the use of his copyright image (Figure C11).

Appendix A: From Time to Time: Retro-Meta-1 Reflections on Time(s)

Introduction

> To the perspectival age time meant nothing but a system of measurement or relationships between two moments. . . . Time, however, is a much more complex phenomenon than the mere instrumentality or accidence of chronological time. (Gebser, 1949/1985, p. 285)

My cognizance of the complexity of the discourses on time—cultural, scientific, philosophical, feminist, historical, theological— in-*tim*-idates me. Yet, inspired by the criticality of our present planetary moment *in time*, I feel beckoned into developing a tentative temporal template[2] for my evolution of consciousness research.

The imperative to contextualize the *default* notion of time is twofold. First, a lack of contextualization may lead to my work being misconstrued as being "just another modernist, linear, (perhaps tacitly) Euro-centric narrative"—albeit camouflaged as integral. Second, the macrohistorical nature of my narrative necessitates a careful consideration of time from multiple perspectives. By the default view of time I mean the three-phase linear-time-model of past, present and future that underlies modernist models of *development*, *evolution* and *progress*. These models are invariably value-loaded such that the past is problematized as primitive, while progress, development, evolution are lauded as unilinear paths to civilization. Although these modernist grand narratives have been under siege for decades, theoretical understanding of this taken-for-granted notion of time is relatively undeveloped.

Over the last two millennia the linear conception of time—which began as the more formal *measurement* of already-recognized cosmic and natural temporal cycles—became rationally conceptualized as the chronological measurement of change. The early development of clocks included astronomical/astrological features, indicating notions of time that were still connected with cosmic cycles—beautifully exemplified by the astrological clock in the tower of the town hall in Prague, built in the early 15th century. Since the Industrial Revolution linear, chronological time has further contracted by association with *mechanical* time and *factory* time. Further scientific and technological developments in the last century have seen temporal partitioning become hyper-exaggerated by increasingly sophisticated scientific and digital means, from one extreme in radioactive half-life, to the other extreme in nanoseconds.

---

[1] The concept of *retro-meta* was coined by Morin to express the complex recursion that "sustains living processes at all levels" and is inherent in a full understanding of the prefix RE. "The process of RE complexly unifies and intermixes the past and future in order to generate the creative pulse of evolution" (Morin, 2005a, p. 254).

[2] My usage of *template* refers at least to its etymological roots from the Latin: *templum* "piece of ground consecrated for the taking of auspices, building for worship," and from the French *templet* "weaver's stretcher," the latter, in relation to my planetary tapestry. http://www.etymonline.com/index.php?search=template&searchmode=none

SOME RIGHTS RESERVED

Linear time has also become dominated by politico-economic features, exemplified by such phrases as "time is money," "buying time." This mechanistic and economic colonization of time has increased exponentially in recent decades, contributing to the *speed addiction* of our present age—demonstrated in fast foods, internet, instant global text messaging, accelerated learning, and the three-quick-steps-to-spiritual-enlightenment culture. Just to cope there are drugs to keep up, such as speed and cocaine; and drugs to slow down, such as alcohol and tranquillizers. However, in parallel with the accelerating freneticism and time panic[3] of the 20th century alternative notions have been emerging.

In the early 20th century significant theoretical developments concerning the notion of time occurred in both the natural sciences and the social sciences. In physics, Einstein's theory of relativity displaced the Newtonian conception of *objective* time as an unchangeable, permanent 'place' upon which the movement or change of things can be measured in discrete, identical fragments (Einstein, 1920/2000; Weik, 2004). Synchronously, the new philosophical phenomenology of Husserl was positing a *subjective* time—the time of the soul—in contrast to external or objective time (Husserl, 1905/1964). Numerous theoretical attempts have been made to come to terms with these new perspectives on time. Philosophical developments include Heidegger's phenomenological notion of *existential* time (Heidegger, 1927/1962); Whitehead's process view of time (Griffin, 1986a, 1986b; Weik, 2004; Whitehead, 1929/1985); and Bergson's paradoxical notion of *durée*—the conscious flow of life—which includes a radical multiplicity of Time (Bergson, 1922/1965; Deleuze, 1966/2006). Significant—albeit lesser known—contributions were also made by Steiner and Gebser and will be explicated in this appendix. More recent attempts have been made to reconcile some of these views, e.g., by Schatzki's notion of history and Ricoeur's *poetics of narrative* (Ricoeur, 1985/1988; Schatzki, 2005).

In addition, there has been a recent trend towards diversity in conceptualizations of time (Geissler, 2002). Notions of cyclical time are being reclaimed from non-western (Eliade, 1954/1989; Inayatullah, 1999) and feminist perspectives (Forman & Sowton, 1989; Kristeva, 1986; Leccardi, 1996; Milojevic, 2005b). Initially these two major time perspectives—linear and cyclical—were set up in opposition to each other. However, increasingly, new discourses are emerging that provide a more complex, nuanced perspective. These include:

- Postmodern philosophical concepts such as repetition and difference (Deleuze & Conley, 1992), complex recursion (Morin, 2005a);
- Complex concepts of time in archaeology[4] (Klejn, 2005);

---

[3] Gebser (1949/1985) referred to "time anxiety" and "addiction to time" as symptoms of the deficient-rational mode of consciousness (p. 22).

[4] Russian archaeologist L. S. Klejn (2005) has recently identified "twelve concepts of time . . . These are the primordial presentism, the cyclic notion of time, the genealogical, labeled perception of time (marked time), the linear concept (measured time), the dynamic time (the notion of the flow of time), the concept of general time, the vector time, the time acceleration, the relativist concept, the static time, and the annihilation of time" (Abstract). His article discusses how they manifest various archaeological epochs and how they are displayed in archaeology. The full article is only available in Russian, but I was able to access an English abstract. Clearly this work could contribute significantly to this discussion.

- The emergence of futures studies as an academic field, introducing new concepts of past, present and future, e.g. the 200-year present and the long-now (Boulding, 1990; Slaughter, 1996; Slaughter & Inayatullah, 2000); macrohistory (Galtung & Inayatullah, 1998); long-term and non-Western future-time concepts (Inayatullah, 2000; Inayatullah & Boxwell, 2003);
- Spiral notions of development in worldviews and values reflecting both cyclical and progressive notions (Beck & Cowan, 1996; Cowan & Todorovic, 2005; Inayatullah, 1999; Inayatullah, 2004; Wilber, 1996c);
- Contemporary developments in the “time arts—music and film” (Benedikter, 2005);
- Multiple dimensions of time (Starr & Torbert, 2005);
- Spiritual notions of Eternal Time and the Now (Tolle, 2004);
- The emergent *slow* time movement, e.g. slow food movement (Parkins, 2004); the slow school movement (McGill, 2005).

While there is unquestionably now a substantial and growing body of literature on the various notions of time, there is a lack of theoretical coherence. This appendix is primarily an explication of the time perspectives (temporics) of Steiner, Gebser and Wilber, who frame many of the above-mentioned notions in a macrohistorical, evolutionary context. It is a work-in-progress, providing additional depth to the main paper and pointing to theoretical possibilities for further research.

Gebser’s Temporics in Relation to Evolution of Consciousness

> Temporics is an expression of . . . endeavors to bring to consciousness the abundance and freedom concealed “behind” the concept of time as they relate to all structures and all areas of our entire reality. (Gebser, 1949/1985, p. 359)

Diverse notions of time, and their relationship to structures of consciousness form a major theme in Gebser’s seminal work—*The Ever-Present Origin*.[5] Because of his in-depth focus on the significance of this relationship, I am using his *temporics* to provide the overarching conceptual structure for my analysis of Steiner’s and Wilber’s notions of time. This analysis should assist in uncovering any tacit assumptions about time in the interwoven narratives comprising the main body of this paper, thus increasing their transparency. In the next section, I will primarily illustrate with brief quotes from Gebser’s own text to retain the nuanced flavor of his conceptualizations.

Archaic Pre-Temporality

Gebser says very little about this earliest structure of consciousness. He refers to it as “a ‘non-dimensional’ structure ‘behind’ the physical and biological data and phenomena of the different structures, a structure which is pre-magic, pre-temporal, and pre-conscious” (p. 388). This *original pre-temporality* (p. 356) of the archaic deep-sleep consciousness, is the structure from which a gradual awareness of time exfoliates through the three subsequent structures of consciousness—magic, mythic and mental.

---

[5] In this appendix, all textual quotes from Gebser will be drawn from this source, unless otherwise specified.

Magic *Timelessness*

Gebser primarily uses the phrase *magic timelessness* (pp. 289, 358) when referring to the notions of time in this second consciousness structure. He illustrates this sense with the following quote. “[The] . . . timeless phenomena . . . arise from the vegetative intertwining of all living things and are realities in the egoless magic sphere of every human being” (p. 49). He relates the magic structure with the auditory experiencing of *tone*, noting that timelessness can be integrally re-awakened through music.

Mythical Temporicity

In relation to mythical consciousness, Gebser primarily speaks of “mythical temporicity” (p. 358), and “rhythmic time” (p. 176). He describes a gradual transition from the remote magic timelessness, to a more tangible sense of periodicity, particularly in relation to the seasonal rhythms of nature. He again points to some of the important cultural sites that have been discussed in the main paper, in relation to the transition between magic and mythical consciousness.

> Whenever we encounter seasonal rituals in the later periods of the magic structure, and particularly in astronomical deliberations and various forms of the calendar, as for example among the Babylonians and later Egyptians and Mexican civilization, we find anticipations of the mythical structure. (p. 61)

Gebser also notes that in mythic consciousness there is a reciprocal interplay between the internalization of memory, as recollection, and the externalization of utterance, particularly through poetry (p. 192). This is consistent with Steiner’s characterization of the shift from *localized memory* to *rhythmic memory* (see below).

Mental-Conceptual Temporality

According to Gebser, the birth of linear time occurred with Parmenides’ (b. 540 BCE) tripartition of time into past, present and future (p. 178). He claimed that mental-conceptual time first arose in Greece with notions of measurement, quantity and partitioning of space. He regards the purpose of linear time as facilitating the shift from mythical to mental consciousness. “Time, that is, our mentally oriented conception of time, the divider of mythical movement and the partitioner of the circle, severs its two-dimensionality and thereby creates the possibility of three-dimensional space” (p. 177). Gebser expressed concern about the problems arising from the deficient[6] mental notions of time as illustrated in contemporary *time anxiety* and *addiction to time*. He believed this arose from the overextension of the dividing function, which has reduced *time* to a *spatial* function.

---

[6] Note further discussion on Gebser’s use of the terms efficient and deficient in the main paper.

> Dividing time, which is itself a divider leads to atomization . . . Here we would only note once again that the phenomenon of "lack of time" is characteristic of our material, spatially accentuated world: How is anyone to have time if he tears it apart? (p. 180)

However, he also indicates that this predictable, mechanical, conception of time began to change especially with the elaboration of Einstein's theory of special relativity in 1905 (p. 341). Referring to his notion of *concretion of time*, Gebser notes.

> Wherever time is able to become "the present," it is able to render transparent "simultaneously" the timelessness of magic, the temporicity of myth, and the temporality of mind. There are already signs of this inceptual mutation that can be demonstrated. (p. 181)

Integral-Atemporal ***Time-Freedom***

> Time-freedom as the quintessence of time. (p. 356)

This brief quote from Gebser encapsulates the inherently paradoxical nature of his *integral-atemporal* notion. He uses several different expressions to attempt to communicate what he sees as a central aspect of the emergent integral-aperspectival consciousness. It is as if he is trying to "describe the elephant" from all sides to enter into the complexity of concepts that represent his notion. The terms he primarily uses are: "arational," "time-freedom," "open time," "achronon" (pp. 289, 358); "concretion of time," "temporic concretion" (p. 26); "fourth dimension" (p. 340).

Expanding on his frequent use of *concretion of time* he linked it with two other terms, *presentiation*, and *latency*, distilling how the new consciousness experiences a simultaneous sense of past, present and future.

> Presentiation is "more" than a tie to the past; it is also an incorporation of the future. (p. 271)
> Latency—what is concealed—is the demonstrable presence of the future. (p. 299)

Gebser's nuanced *concretion of time* does not represent a linear developmental endpoint like that of the modernity project, nor is it endlessly recursive in non-directional cyclical space as in Eliade's "myth of the eternal return" (Eliade, 1954/1989). Integral consciousness as understood by Gebser does not place mythic and modern constructions of time in opposition to each other, as both modern and traditional approaches tend to do. Alternatively, Gebser's *temporic concretion* is an intensification of consciousness that enables re-integration of previous structures of consciousness—with their different time senses—honoring them all. It opens to new understanding through atemporal translucence whereby *all* times are present to the intensified consciousness *in the same fully conscious moment*.

In Summary

Gebser proposed that the intellectual realization that time was more than mere clock time began with Einstein's theory of relativity. "Time first irrupted into our consciousness as a reality or world constituent with Einstein's formulation of the four-dimensional space time continuum" (p. 286). Gebser also noted the implications of this for philosophical notions of time. He discussed the gradual displacement of fixed concepts of linear time, particularly through the philosophies of Bergson, Heidegger, Husserl and Whitehead (p. 402-410).

Wilber's Temporics in Relation to Evolution of Consciousness

> Each successively higher mode of self represents an expansion and extension of consciousness, and thus each higher mode of self can grasp increasingly extended temporal modes . . . until time vanishes back into its Source and disappears as a necessary but intermediate ladder of transcendence. (Wilber, 1996c, p. 65)

What indications are there that Wilber is aware of, or enacting, the nuanced complexities of Gebser's *concretion of time*? Wilber's integral framework clearly contains a temporal dimension, in that he conceptualizes comprehensive transpersonal models for both cultural evolution (phylogenesis) and individual development (ontogenesis). However, in the overall scheme of his writing, discussions of time are not emphasized—several of his key books do not index the term *time* at all (Wilber, 1998, 2000a, 2000b, 2001a). I suggest that, for Wilber, time could be regarded as one of many features within an overall spatially oriented model. Frequently referred to as a map or a framework, not the least by Wilber himself, his framework is divided and partitioned in multi-faceted ways. This may indicate that he is primarily operating in a conceptually *spatial*, rather than a conceptually *temporal* mode. The significance of this in relation to Gebser's approach may become clearer as our analysis proceeds. It is worth noting that Gebser equates the dividing and partitioning of knowledge—the *ratio* part of rational—as marking the beginning of the deficient phase of the mental, rational mode (Gebser, 1949/1985, p. 93). Could this imply that Wilber's framework is a type of meta- or hyper-rational model?

When Wilber does refer to time he appears to emphasize one or other of two extremes.

- A strong linear perspective—where he frequently uses the phrase "time's arrow" (Wilber, 2000d, p. 19);
- A timeless spiritual present—where he frequently uses the phrase "always already" (Wilber, 2001a, p. 50).

These two notions will now be discussed briefly in an attempt to uncover how Wilber reconciles this contradiction.

Time's Arrow—A Strong Linear Perspective

In what I understand to be Wilber's (1996c) most developed documentation of his linear-time perspective,[7] his terminology lies close to Gebser's, yet it appears that his meanings may differ. Although he borrows Gebser's term *exfoliation*, his emphasis indicates a more linear template.

---

[7] This is the second edition (1996) of *Up from Eden*. Although he has published several books since then, I have not been able to identify any further developments on this model.

For example, it is arguable whether Gebser's "pre-conscious" equates with an attribution of "ignorance" (See point (1) below.) Wilber (1996) summarizes his temporics as follows.

> There are different structures, or different types, of time that exfoliate from the Timeless. In ascending, expanding, and evolving order, corresponding with the levels of the Great Chain, we have:
> (1) The pretemporal ignorance of the pleroma-uroboros;
> (2) The simple passing present of the typhon;
> (3) The cyclic, seasonal time of mythic-membership;
> (4) The linear and historical time of the mental-age;
> (5-6) The archetypal, aeonic, or transcendental time of the soul;
> (7-8) The perfectly Timeless eternity of Spirit-Atman. (p. 65)

The numbers in parentheses relate to Wilber's individual developmental stages—also linked to similar temporal stages—as set out in *The Atman Project* (Wilber, 1996b, p. 44-46).

Wilber (2000d) characterizes his notion of *time's arrow* as the "irreversible direction through time" postulated by evolutionary theorists from Heraclitus and Aristotle, through Leibniz, Schelling and Hegel to Darwin. In these theories, "evolution proceeds irreversibly in the direction of increasing differentiation/integration, increasing structural organization, and increasing complexity" (p. 19).[8]

Wilber (2000d) links this to his notion of *spiritual ascent* with its linear trajectory from lower to higher.

> Darwinists could always be seen . . . as simply supplying empirical evidence for a scheme already known and accepted, namely, evolution as God-in-the-making, Eros not simply seeking Spirit but expressing Spirit all along via a series of ever-higher ascents" (pp. 537-538).

While this proposition may well have been accepted by several of the German idealists, Teilhard de Chardin, Sri Aurobindo and others, it is implied by Wilber that the relationship between biological evolution and spiritual ascent [9] is universally accepted. From my research, this is far from the case in conventional evolutionary theory today.

Always Already—A Timeless Spiritual Present

At first glance the above quotes seem to suggest an overarching, linear, developmental emphasis in his approach to understanding time sense, however, he then follows it, in the next paragraph with the statement: "until time itself vanishes back into its Source, and disappears as a necessary but intermediate ladder of transcendence" (p. 65). This appears to link to an earlier section in this book where he includes a diagram showing these eight developmental stages—as he conceptualized them at this time—held within a circular model, beginning and ending with the "ground unconscious" (Wilber, 1996c, p. 12).

---

[8] Wilber (2000d) also notes that from the perspective of the second law of thermodynamics in regard to some aspects of the physiosphere *time's arrow* could be seen to be winding down (pp. 18-19).

[9] This particular statement also omits to refer to the dialectical notion of spiritual descent although Wilber does acknowledge it elsewhere (Wilber, 2000d). He does not appear to give it the type of equivalence to ascent that is expressed, for example, by Sri Aurobindo (2000) in his notion of the divinization of the earth.

The Origin vs. Archaic Controversy

There is an apparent contradiction between some of Wilber's statements that reflect the Timeless Spiritual Presence, "we were once consciously one with the very Divine itself" (Wilber, 2001a, p. 50) and some of his more linear statements, referring to the "pretemporal ignorance of the pleroma-uroboros" (Wilber, 1996c, p. 65). It is unclear whether Wilber also sees an even earlier, *conscious* stage prior to the uroboros. This is a complex issue that is beyond the scope of this appendix to engage with fully. For further reading there has been extensive discussion between Feuerstein (1997) and Wilber in regard to convergences and divergences between Wilber's and Gebser's views of the nature of the archaic structure of consciousness in relation to origin.

Gebser's Integral vs. Wilber's Transpersonal Levels

While Gebser sees integral time concretion as the point where consciousness folds back on itself and integrates the whole, Wilber (1996c) sees this as inadequate as a theory of spiritual development, going as far as making the following major critique of Gebser.

> What Gebser and Habermas both lacked was a genuinely spiritual dimension. Gebser vigorously attempted to include the spiritual domain in his work, but it soon became obvious that he simply wasn't aware of—or did not deeply understand—the contemplative traditions that alone penetrate to the core of the Divine. As I said, beyond Gebser's integral-aperspectival there are actually several stages of transpersonal or spiritual development, which Gebser clumsily collapses into his integral stage. (p. ix)

My research on Gebser demonstrates that this is far from the truth. I am wondering if Wilber had in fact read Gebser's seminal work when he made this comment in 1996, or was deducing this opinion from a secondary source. His reasoning is that Gebser's highest stage is integral-aperspectival—equivalent to his centauric-existential, whereas his own model (at that time) claimed several other higher stages—"psychic, subtle, causal and nondual occasions" (p. ix). My own interpretation of the matter is, firstly, that the situation is a lot more complex than the *either/or* that Wilber is suggesting between his and Gebser's models but a full analysis would require far more space. I would like, however, to provide some of Gebser's actual words that appear to me to indicate that Gebser's work does indeed have "a genuinely spiritual dimension," in contrast with Wilber's claim. Gebser states,

> A new possibility for perceptual consciousness of the spiritual for the whole of mankind one day had to shine forth. Previously the spiritual was realizable only approximately in the emotional darkness of the magical, in the twilight of imagination of the mythical, and in the brightness of abstraction in the mental. The mode of realization now manifesting itself assures that in accordance with its particular nature, the spiritual is not only given

> emotionally, imaginatively, abstractly, or conceptually. It also ensures that in accordance with our new capacity it is also perceptible concretely as it begins to coalesce with our consciousness. . . . The shining through (diaphaneity or transparency) is the form of appearance (epiphany) of the spiritual. (p. 542)

Wilber's vertical transcendent model where full unity with the Divine awaits the ascent through all the stages seems to weigh his whole approach towards vertical linearity. Gebser's approach clearly tilts more towards an expression of spiritual immanence than Wilber's, yet Gebser is clearly describing an authentic spiritual dimension. Wilber's later work in Integral Spirituality does attempt to address issues of spirituality at all stages of development through his Wilber-Combs matrix, but to address this in detail would move beyond our focus here on temporics (Wilber, 2006).

In Summary

Wilber tends to swing between a primarily linear developmental model—albeit one that includes higher stages beyond the formal, mental mode—and the spiritual Timelessness of the non-dual. Sometimes, he brings both voices through in the same piece of writing, as indicated above. However, it is unclear whether Wilber sees Timelessness as being synchronous with Gebser's origin. It appears likely that for Wilber this is an endpoint to be strived for rather than something that can be experienced as a concretion of all the temporicities.

Steiner's Temporics in Relation to Evolution of Consciousness

> Out of the womb of time there is born for us human beings that which is beyond time. . . .
> For as far as human work is concerned, Eternity is the birth of that which has matured in Time. (Steiner, 1922/1940)

What indications are there that Steiner is aware of the nuanced complexities of Gebser's *concretion of time*? There are several aspects of Steiner's work where one might look to respond to this question. Firstly, it could be noted that many of Steiner's books and lecture series are related to notions of time, history, mythology or relationships between time and consciousness (Steiner, 1926/1966b, 1950, 1904/1959, 1971a, 1971b, 1971c, 1971d, 1982c). This is by no means a complete list but rather a representative selection. This is also not intended to suggest that he overly emphasized time or did not problematize the terms *time* or *history*—time is just one of the themes he researched in depth. A unique feature of Steiner's approach is that he does not isolate time from other factors. His writing on time is very complex,[10] and in itself integral-aperspectival, in my view, in that he consciously presents views from a number of perspectives. The themes he discussed in relation to *time* include human memory, history, astro-geological cycles and progressive recapitulation. These are all complexly interwoven within his writings.[11]

---

[10] I am aware that my section on Steiner's temporics is considerably longer than the other two, however, his work on time is arguably much more extensive, including additional areas such as *precession of equinoxes* that have not been touched by the other narratives.

[11] Several methodological challenges arise with researching Steiner's views on any theme. The most obvious are: German-to-English translation issues; and the fact that many of his works were transcribed lectures, unrevised by him before his death. An additional, more subtle challenge is that the complex

Time and Memory

Like Gebser, Steiner pointed to the relationship between human memory and the gradually evolving sense of time. Steiner (1950) described a three-stage development of memory that he called *localized*, *rhythmic* and *temporal memory*. Steiner (1904/1959) also referred elsewhere to *cosmic memory*.

Localized Memory

Steiner (1950) claimed that in very early times—which from the context of his text appear to be Upper Paleolithic—memory was not yet internalized within the human psyche, but was connected with place, with the Earth, requiring signs and prompts such as "memorial tablets and memorial stones" (p. 16). This appears to link to Gebser's magic consciousness.

Rhythmic Memory

Following this, during the transition from the magic to the mythical—related to his *Indian cultural period*—Steiner (1950) claimed that memory began to become internalized and we learned to remember by rhythm and repetition, through which "the whole ancient art of verse developed" (P. 17). He referred to ancient Asia as a central location . . . citing the *Bhagavad-Gita* and the *Vedas* as later codified examples of this rhythmic memory (p. 18).[12] Learning *by heart* is a vestige of this type of memory and Steiner mentions the importance of this in children's education.

Temporal Memory

Steiner (1950) characterized the temporal memory that "we take for granted today" (p. 17) as beginning in the Greco-Roman cultural period emerging around 800 BCE with the classical Greece of formal history. This of course coincides with the emergence of intellectual-mental-rational consciousness as we have seen in the main paper. Wilber (1996c), drawing on Whyte and Bergson, also refers to the emergence of memory—apparently referring to what Steiner calls "temporal memory"—in association with the mental-egoic consciousness (p. 206).

---

interwovenness of his work means that important views are very often scattered throughout his writing—even in seemingly—non-relevant titles. This is exacerbated by the fact that, although some of his published works include a detailed *table of contents*, most volumes are not indexed. Consequently, it can be quite laborious finding relevant textual material. By contrast, Wilber's published writing includes adequate *tables of contents* and *indexes* and is generally more thematically organized—according to the standard academic form of our times, and therefore quite easy to source. Gebser's English-published writing, although complexly interwoven like Steiner's, includes a very detailed *table of contents* and is meticulously indexed.

[12] The development of rhythm was also enhanced by the emergence and cultivation of music (See Appendix C for more information on this development).

Cosmic Memory

Steiner (1904/1959) also proposed that through *conscious* spiritual development we may go beyond the ordinary, everyday temporal sense and attain access to our *cosmic memory*—the deep collective past—and, in some instances, the future. He referred to the field where this information is stored as the *Akasha Chronicle* or *Akashic Record* (p. 39). Laszlo—from a scientific perspective—has also recently proposed the term *Akashic field*, or *In-formation* field for the field that stores cosmic memory (László, 2007). Gebser's (1949/1985) notion of "atemporality" or remembering the future is similar—he cites Rilke's poetic line: "wishes are recollections coming from the future" (p. 504). This future-time-sense is at the core of the contemporary futures studies literature (Slaughter, 1999).

Time and History

Steiner (1924/1973a) also held a very large, meta-historical perspective that he characterized as having three stages: *cosmic or heavenly history*, *mythical or mythological* history and *earthly* history.[13] He also refers elsewhere to *non-transitory history* (Steiner, 1904/1959, p. 39), which being beyond linear time, may resemble Gebser's "time freedom." I will primarily illustrate with brief quotes from Steiner's own text, to retain the nuanced flavor of his conceptualizations.

Cosmic/Heavenly History

"Earlier peoples still had this 'heavenly History' in their consciousness, and were indeed far more aware of it than of the Earthly . . . The man of that age, when he came to speak of 'origins,' did not relate earthly events but cosmic" (Steiner, 1924/1973a, p. 143). This appears to relate to Gebser's magical timelessness.

Mythical History

"This . . . was followed by the mythical History . . . [which] combines heavenly events with earthly. 'Heroes,' for instance . . . appear on the scene" (p. 144). This is clearly linked with Gebser's mythical structure. Steiner (1924/1973a) considered these *heroes* to be more highly evolved beings who worked through the initiates and leaders of the time in various places. Wilber's (1996c) two parallel strands of evolution—the evolution of the *average mode* of consciousness and the evolution of the *most advanced* mode of consciousness—concurs with this (p. 339).

---

[13] It would be interesting to explore how Steiner's three stages of history might relate to Nietzsche's three modes of history: *antiquarian*, *critical* and *monumental* history, where, in the latter, "exemplary insights from the past flash forward, bespeaking their validity and guiding us today" (Schwartz, 2005, p. 137-138). Or indeed, how Steiner's and Nietzshe's notions might relate to Kristeva's concepts of cyclical, rhythmical time and "monumental temporality . . . all-encompassing and infinite like imaginary space" (Kristeva, 1986, p. 191); or Starr and Torbert's (2005) one-, two- and three-dimensional time notions. See also Sean Kelly (1993). These are interesting pointers for further research.

Earthly History

The origins of formal *history*[14] as-we-know-it, has been present "since the unfolding of the Intellectual or Mind-soul [in ancient Greece]. Nevertheless for a long time [people] continued to 'think' in the sense of what had been before [that is, mythically]" (Steiner, 1924/1973a, p. 145-146). This reflects Gebser's mental time conception. Wilber (1996c) claimed that history began a few hundred years earlier, c. 1,300 BCE, with the Assyrian rulers (p. 213).

Non-Transitory History

Steiner (1909/1959) proposed that freedom from the limitations of linear time could be developed through the new consciousness from the beginnings of the 15th century and increasingly in our times. He also pointed to a new *self-reflective* period where we would be aware of our actions in linear history and also be able to *pay attention to* our own historicity. This insight seems to foreshadow contemporary attention to historicity, arising from postmodern philosophy and hermeneutics. Gebser also spoke of divesting history of "its mere temporality and sequential nature" (p. 192).

Steiner's *Progressive Recapitulation* as *Complex Recursion*

> The many aspects of RE involve simultaneously: a reactivation of the ancestral past, a production and reproduction of present existence, and arrangements for the future. RE always includes a return to the past that resuscitates it in the present. By this movement, RE catapults the past towards the future. (Morin, 2005a, p. 261)

Morin's notion of *RE*—representing complex recursion—appears to align with Gebser's concretion of time and Steiner's progressive recapitulation[15] theory. Steiner (1910/1939) claims that in each new stage of evolution, there is a "recapitulation" of the previous stage in a way that "is something like a repetition of . . . evolution [that] takes place on a higher level" (p. 155). He considers this process to be operating at every level of existence, including the previous stages of cosmic existence of the earth (cosmogony), socio-cultural evolution (phylogeny), and individual development (ontogeny). Morin (2005a) furthers this perspective. "*Innovation is Inscribed in the Return that it Transforms* . . . Evolution is at once a break from repetition, through the upwelling of the new, and the reconstitution of repetition through the integration of the new" (p. 264). Laszlo (2006) observes a similar process in the evolution of societies. "The nonlinear but on the whole progressive evolution of societies is driven by innovations that perturb and eventually destabilize previously stable systems" (p. 105). (See also Deleuze's (1994) notion of repetition and difference).

---

[14] The first official *chronological* historians were Herodotus (484BCE-c.425BCE) and Thucydides (460-c.400BCE), the latter taking a systematic historical method that emphasized chronology and human actions. Systematic historical method also began in China with Sima Qian (145-90BCE) of the Han Dynasty, indicative of mental mode time conceptualizations there as well.
http://en.wikipedia.org/wiki/History

[15] I am coining the term *progressive recapitulation* as a descriptor of Steiner's evolutionary perspective. It is not his actual term.

One way to investigate evolution's complex recursivity is to explore relationships between astronomical cycles and anthropo-socio-cultural cycles.[16] While both ancient hermetic science and modern astronomy have investigated such relationships, the potential influence of cosmic/astronomical cycles on the *anthropo-social sphere*[17] has been largely ignored by modern and postmodern social scientists—in spite of having been already postulated as early as ancient Greece. We will now briefly explore the state of research in this area.

Solar *Pre*cessions and the *Deep-Time-Cycles* of the World

> The orientation of the Earth's rotational axis in relation to the stars and clusters of stars is not fixed, but varies slowly, over time, because of the gravitational influence of the Sun and the Moon on the swelling of the Earth's equator. If we extend the earth's axis to the imaginary sphere of the fixed stars, the point of intersection describes a circle of approximately 26,000 years. (Bocchi & Ceruti, 2002, p. 4)

Steiner was the first post-Enlightenment scholar, as far as I have been able to ascertain, to substantially research and document the relationship between astronomical cycles such as the precession of the equinoxes and anthropo-socio-cultural evolution. The notion of the *precession of the equinoxes*, is thought to have been known to the civilizations of Mesopotamia and the Nile valley as early as 3,000 BCE, but only fairly recently formalized by modern astronomy. The complete precession cycle is a period of approximately 25,700 years—the so called great Platonic year—during which time the equinox regresses over a full circle of 360°. While paleoclimatologists have begun to recognize the contribution of this process to cycles of climate change such as ice ages,[18] there is little mention of it in the evolution of consciousness discourse. Although Steiner pointed to these links a century ago, neither Gebser, nor Wilber, have indicated any possible macrocosmic influence on the cycles of change in human culture and consciousness. More recently, a humble resurgence of interest is dawning in this under-researched area of human concern from philosophers (Bocchi & Ceruti, 2002; McDermott, 1984; Tarnas, 2006; Ulansey, 1994), and evolutionary psychologists (Sedikedes, Skowronski, & Dunbar, 2006). Philosopher of science Gianluca Bocchi and genetic epistemologist Mauro Ceruti, using a transdisciplinary narrative approach, draw on the notion of the precession of the equinoxes to illuminate the myths of many cultures that refer to a previous Golden Age[19] (Bocchi & Ceruti, 2002).

---

[16] Drawing on a combination of his recapitulation and precession of equinoxes theories, Steiner proposed a U-shaped theory of cultural development, with the Greco-Roman period being the pivotal turning point (Steiner, 1910/1939). He suggested the current emergent culture and consciousness will recapitulate some qualities of the cultures of the fourth period, for example, Ancient Egypt, not as a regression but recursing at a higher more conscious resonance. This could well be interpreted as an example of Gebser's *concretion of time*.

[17] This is one of Morin's composite terms, for which he is famous. "It is interesting to emphasize in Morin's *ecological* perspective the importance of the 'dash,' which establishes the linkages, the connections, that binds the words anew" (De Siena, 2005, p. 423).

[18] The precession of the equinoxes is one of several astronomical cycles that are believed to influence the 100,000-year cycle of ice ages (this being approximately four complete Platonic years of 25-26,000 years). "There are three astronomical variables used in paleoclimatology: the obliquity, the eccentricity multiplied by the sine of the longitude of perihelion, measured from the vernal equinox, [i.e. the precession of the equinoxes] and eccentricity itself." (Varadi, Runnegar, & Ghil, 2003) These three cycles are referred to as the Milankovitch cycles.

Steiner made a unique potential contribution to the evolution of consciousness discourse in this area. He explored in some detail, across numerous books and lectures, the 2,160-year periods of the sun's precession and the relationship of this to the evolution of culture and consciousness According to Steiner (1971a), in his first post-glacial cultural period—the ancient Indian—the sun at the vernal equinox was moving into the constellation associated with Cancer (p. 52). He claimed that it then continued to move every 2,160 years, transitioning through Gemini in the Persian period, Taurus in the Egypto-Babylonian period, Aries in the Greco-Roman period (Steiner, 1971b), and so on. Historian of religion, David Ulansey, has undertaken and published substantial research into the notion of the precession of the equinoxes in relation to the ancient Roman Mithraic religion and their astrological mythologemes related to Taurean metaphors (Ulansey, 1991, 1994). Such research if extended to other cultural periods could be very fruitful. Philosopher, Richard Tarnas, has recently published the results of decades of research on the influence of astronomical events on human culture and consciousness (Tarnas, 2006). His work, however, primarily concerns shorter planetary cycles and not the large macro-cycles being referred to here.

In Summary

Steiner's writing demonstrates a complex dialectic between progressive development and cyclical recursion. Like Gebser's writing, it points to a new stage of consciousness that is capable of beginning the integration of all aspects of human nature. And like Wilber's writing it also foreshadows the potential of further future stages.

Pre-temporal, Temporal and Trans-temporal Notions of *Time*

As demonstrated, Steiner, Gebser and Wilber all identify more than three stages in the development of human conception of time, and all agree that the notion of linear, historical time co-arose with the emergence of mental-egoic consciousness in approximately the first millennium BCE. They each make important distinctions between linear time and our notions of time prior to this. They each identify emergent postformal, integral notions of time. However, they differ in their conceptualizations and languaging of these issues.

---

[19] Bocchi and Ceruti (2002) explain how the particular nature of this astronomical event between 4,000 and 3,000 BCE was so dramatic as to mark the end of the *Golden Age* in human myths.

> For people who lived in 4,000 [BCE] the Milky Way traced the path of the Sun, a visible indication of the annual transit of the Sun above the Heavenly equator. This configuration was very symmetrical. The way to the heavens was opened to human beings if they crossed the two mighty gates of Gemini and Sagittarius. . .
>
> The precession of the equinoxes broke this symmetry. The Heavenly gates collapsed. The Sun was exiled in strange . . . regions, a part of the Milky Way sank in the abyss below the heavenly equator. . . . This was the end of the Golden Age. (pp. 5-6)

They explain how this astronomical event was at the basis of the belief that was held as recently as the 17th century by philosophers, theologians and even scientists that the world was created in approximately 4,000 BCE. Some creationists still believe that to this day (p. 3).

Wilber's *Pre-Trans Fallacy* as an Expression of Linear Ascent

Making use of one of his iconic phrases, the *pre-trans fallacy*, Wilber distinguishes between what he calls the *pre-temporal* or *atemporal*[20] *lack of* time sense of the archaic-uroboric consciousness—which he identifies with Freud's *Id* in developmental terms—and the *transtemporal* or *eternal* present. Wilber (1996b) associates the former with temporal ignorance, where "there is no time in it because it is too primitive—too *dumb*—to grasp such notions (p. 90) (emphasis added). He associates the *transtemporal*—using the metaphor of the fifth floor of a building—with the higher levels of development, in the transpersonal realms that he claims are accessing "mystic union" or the "primal Ground of Being" (Wilber, 1996b, p. 90). In this example, the ascended linearity of Wilber's model is foregrounded, with its negative value judgments in relation to earlier/lower levels. However, although he *categorically* states there is a difference between pre- and trans-temporality—just as he does with pre- and trans-rationality—Wilber's writing does not actually bring through the difference phenomenologically. My sense is that he is using his intuition here. He *knows* there is a difference but it is not discernible through his words. Both Gebser's *intensification of consciousness* and Steiner's *heightening of consciousness* appear to be aligned to Wilber's notion on *trans*-temporal as distinct from *pre*-temporal.

Gebser's *Time-Freedom* through *Intensification of Consciousness*

When Gebser (1949/1985) characterized his integral notion of *atemporality*—as distinct from *pre-temporality*—he noted several significant features. He foregrounded the notion of time-*freedom*, and identified the following three characteristics as being expressions of it.

- *Intensification* of consciousness. "Time-freedom is the *conscious* form of archaic, original pre-temporality" (p. 356);
- *Concretion* of the three previous time-mutations. "By granting to magic timelessness, mythical temporicity, and mental-conceptual temporality their integral efficiency, and by living them in accord with the strength of their degree of consciousness, we are able to bring about this realization. . . . The conscious quintessence of all previous temporal forms" (p. 356);
- The *fourth* dimension. "Time-freedom is the fourth dimension because it constitutes and unlocks the four-dimensionality . . . Its conscious form . . . is an *integrative dimension*, or, more exactly, it is the *amension* and not just an expanding or destructive spatial dimension. . . . a-categorical . . ."a-waring" and transparent" (p. 356).

When Gebser speaks of what needs to be concretized in his concretion of time, he is referring to the concretion—or simultaneous consciousness of—the magical, mythical and mental structures of consciousness. In their most condensed forms Gebser (1949/1985) refers to them as "our vitality, psychicity, and mentality" (p. 300).

---

[20] Incidentally Gebser makes a clear distinction *between* these two terms using *pre-temporal* for archaic and *atemporal* for integral *time concretion*.

Steiner's *Philosophy of Freedom* through *Heightening of Consciousness*

Steiner identified several factors related to the emergent consciousness, linking it to the development of human freedom and integration of several faculties. Although Steiner (1914/1973c) does not use the term *time-free*, he appears to use the terms *sense-free* or *body-free* consciousness in a similar sense, linking it to notions of heightened consciousness. The following three points bear resemblance to Gebser's notions.

- *Sense-free* consciousness. "Must not be confused with those enhanced mental conditions that are not acquired by means of characterized exercises but result from states of lower consciousness, such as unclear clairvoyance, hypnotism, etc. . . . This inner work consists in a heightening, not a lowering of the ordinary consciousness" (p. 466-467).
- *Heightening of consciousness*. He links this heightened consciousness with being *beyond* notions of temporality or even eternity.
- *Condensation of feelings.* Thirdly, he referred to a process of *condensation of feelings*, similar to Gebser's *concretion of time*.

Expanding on the latter point Steiner (1914/1973c) commented,

> Through continued practice of the soul, that is, by holding the attention on the inner activity of thinking, feeling and willing, it is possible for these "experiences" to become "condensed." In this state of "condensation" they reveal their inner nature, which cannot be perceived in the ordinary consciousness. (p. 453)

From my hermeneutic study of their works, I interpret that Gebser's (1949/1985) text referring to concretion of "our vitality, psychicity, and mentality" (p. 300), echoes Steiner's notion of "condensation of thinking, feeling and willing." I propose that Gebser's *mentality* (mental mode) relates to Steiner's *thinking* (intellectual soul), Gebser's *psychicity* (mythical) relates to Steiner's *feeling* (sentient soul), and Gebser's *vitality* (magic) relates to Steiner's *willing* (also related to magic, nature forces). Thus there is a close alignment between some of their key concepts.

Gebser's Concretion, Wilber's Paradox, and Steiner's Progressive Recapitulation

Gebser's Concretion of Time

Gebser focused powerfully in so many ways on his notion of concretion of time. Although it is arrived at through a linear process, in itself, it has a cyclical character. I have tried to clarify it through presenting his work from a variety of angles as it behoves us to come to terms with a notion he has tried so hard to communicate.

Wilber's Paradox

The underlying paradox of Wilber's temporics is related to the unclear relationship between 1) his vertical multi-stepped transcendent model, where full unity with the Divine awaits the ascent through all the stages; and 2) the actual polar swing between his vertical model and his Timeless-Spirit model, where he (2000a) refers to “that which is actually your own Original face” (p. 141). Perhaps more research could ascertain whether there is a rationale for the different contexts in which one or other model is used. Overall, his work seems to weigh more heavily towards vertical, linearity.

Steiner’s Progressive Recapitulation

In addition to his apparently linear perspectives of time in relation to memory and history, Steiner (1914/1973c) also spoke in other contexts about the dialectical relationship between *temporality*, and notions of *infinity*, *eternity* or *duration*. He also emphasizes the meta-cyclical and recapitulative aspect.

In summary, all three approaches involve varying degrees of complexity in relation to time, including aspects of both linear progress and cyclical return. However, Gebser consciously problematizes issues of progress, slightly favoring the cyclical return model with its emphasis on origin and spiritual immanence; Wilber aspires to a non-dual approach but appears to tacitly favor the linear model with its emphasis on spiritual ascent and transcendence; Steiner’s approach appears to comprehensively integrate both metacyclical recapitulation and progression suggesting its complex, progressive, recursive nature.

Conclusion

This extended temporal analysis has demonstrated that the default, modernist, linear time perspective can be historically contextualized as emerging in ancient Greece in the first millennium BCE, in parallel with the awakening of the intellectual-mental-rational consciousness structure, most notably identified with the origins of western philosophy. Gebser proposed that this default notion of linear time—as well as all previous time senses—could be integrated in the integral-aperspectival consciousness. This integral-atemporal view transcends and includes the three earlier time perspectives: magical timelessness, mythical cyclicity, and mental linearity.[21] His view is supported by Steiner’s and Wilber’s evolutionary views on time, though in their own distinct ways. It is in this complex, integral view of time that my evolution of consciousness narrative is situated.

There are many theoretical implications arising from these perspectives that could make a substantial contribution to the current state of theorizing about time. However, such extensive research is beyond the scope of this appendix.

---

[21] Since there is no time sense in the Archaic it cannot be included.

Appendix B: Cosmic Kinship: A Micro-Macro View of Space

Introduction—Interrogating the Space of *Space*

> Our planet requires polycentric thought that can aim at a universalism that is not abstract but conscious of the unity/diversity of the human condition; a polycentric thought nourished by the cultures of the world. (Morin, 2001a, p. 52)

As far as we know, or can determine at this point in our global knowledge capabilities, the earth is the *only-born child* of her kind in the cosmos. In spite of our common biological ancestry with other mammals,[1] we humans appear to be the most biologically suitable species to play an active role in earth's nurturing care. Yet the imbalance that has arisen from the over-extension of the egoistic aspects of mental-rational consciousness has led to the polar opposite of care for our only planetary home. The imminent possibility of a major planetary catastrophe, and a climate increasingly inhospitable for human habitation—already correlated with mass extinction of species—demands an urgent reframing of human relationships with nature and the cosmos. The insights that have arisen from the narratives of Steiner, Gebser and Wilber may throw new light on concepts of cosmos and space—aligned as they are to Morin's notion of *polycentric* thought. Gebser (1949/1985) claimed that as the mental-rational mode of thinking took hold, particularly in Europe, it facilitated a new spatial awareness that gradually turned into an overemphasis on space and spatiality that increased with every century since 1500 (p. 22). This led to the victories and horrors of the *Age of Discovery*—which as Edgar Morin indicates was the beginning of the *Planetary Age.* In the last few decades—once the geographic exploration of the earth was exhausted—this developed into a new obsession with scientific explorations in *outer* space.

My interest in this brief appendix is to interrogate some of the taken-for-granted assumptions of modernist notions of *space*. Such an interrogation is already underway in several contemporary discourses, such as postmodern philosophy (Benko & Strohmayer, 1997; Foucault, 1986); feminist geography (Aiken, Brigham, Marston, & Waterhouse, 1988; Ainley & Ainley, 1998); queer theory (Brown, 2000; Cruz-Malave & Manalansan, 2002); postcolonial perspectives of cultural theory (Cruz-Malave & Manalansan, 2002; Mathani, 2001); and emergent integral explorations of *liminal conceptual space* (Hampson, 2007). These reformulations of *space* focus primarily on the opening up of cultural and social space, and thus also conceptual/noospheric space. I am particularly interested in pointing to how the modernist worldview based on scientific materialism has colonized the noosphere[2] with respect to our concepts of *planetary* space and *outer* space—by way of its *physicalist* metaphors drawn from classical physics.[3]

---

[1] It is noteworthy that our brains are second only in complexity to dolphins (Russell, 2000).

[2] The *noosphere* is "the envelope of thinking substance" and is more fully discussed in the main paper (Teilhard de Chardin, 1959/2004, p. 151).

[3] This is not to underestimate the value of classical physics nor to suggest that developments in the science of cosmology throughout the 20th century—such as *the anthropic principle* (Barrow & Tipler, 1986) and the *metaverse theory* (Davies, 2007; László, 2007)—do not contribute to postformal conceptual

SOME RIGHTS RESERVED

I propose that a new look at relevant concepts from a postformal, integral-planetary lens could re-introduce other notions such as *inner* space to complement *outer* space, cosmo*sophy* to complement cosmo*logy*, *soul/spiritual* space to complement *physical* space, and *planetization* to complement *globalization*. These *other* components of space have become marginalized by the one-sided emphasis of scientism. I have drawn quite strongly here on the pioneering spiritual evolutionary theories of Pierre Teilhard de Chardin (Teilhard de Chardin, 1959/2002, 1959/2004) and the ecological philosophy of Edgar Morin (Morin, 2001a, 2005a; Morin & Kern, 1999). They have both contributed enormously to a spiritual reconfiguration of humanity's place—and responsibility—in nature and cosmos. Additional literature is incorporated where relevant. This appendix is a work in progress. It is not conclusive, but rather points to some new areas for integral research and to some additional resources that also point to a renewal of spatial metaphors.

The Hermetic Science of Unitive Space—*As Above so Below*

> That which is Below corresponds to that which is Above, and that which is Above, corresponds to that which is Below, to accomplish the miracles of the One Thing.[4]

Up to and including the mythic structure of consciousness, according to Gebser (1949/1985), humans lived within an undifferentiated sense of space, "as a simple inherence within the security of the maternal womb" (p. 10). Oases appeared and disappeared; river valleys flooded and baked; and rambling farming settlements began to evolve into cities, along the Nile, Tigris-Euphrates, Indus and Huang He valleys. In the civilizations of Egypt and Mesopotamia, with their clear desert skies, and their pictorial imaginations, the people felt a special relationship with the sparkling stars in the celestial dome overhead. The Egyptian astronomer-priests directed the placement of buildings according to astronomical orientations, while the pyramidal buildings of these times reached up to the sky. The Hermetic[5] sciences were profoundly unitive sciences based on a perceived intimate relationship between the macrocosm and the microcosm. Yet this ancient wisdom was held within a mythic consciousness.

The Hermetic notion of the sacredness of the relationship between human, earth and cosmos—including the mathematico-geometric proportions therein—continued to inspire human aspirations for thousands of years. It is most notably articulated in sacred geometry (Lawlor, 1982) as expressed in temple, mosque and cathedral architecture, which seeks to mediate the rift between the human on earth and the divinity of the cosmos. This Hermetic integration of science,

---

emergence. Rather, I am suggesting that the potentially highly significant implications of the latter have not been fully explored philosophically.

[4] These words were translated by Sir Isaac Newton from the *Emerald Tablet*—a Hermetic text attributed to Hermes Trismegistus, the legendary founder of the Hermetic tradition (Dobbs, 1988). See also the Sussex University *Newton Project* http://www.newtonproject.sussex.ac.uk/prism.php?id=1.

[5] According to legendary oral records, Hermes Trismegistus, an ancient Egyptian spiritual leader, originated the Hermetic sciences. Johannes Kepler linked his Hermetic writings with the ancient Egyptians in recently translated writings on the *musica mundana*—or *harmony of the spheres*—available for the first time in English via the Schiller Institute in Washington, DC (Kepler, 1619/1997). More information about the *Kepler Project* of the Schiller Institute is available. http://www.wlym.com/~animations/harmonies/index.php

art and spirit continued to inspire leading-edge scientific thinkers such as Kepler[6] and Sir Isaac Newton[7] during the transition to modern science—and this realization is leading to some dramatically new ideas on their *other* marginalized writings (Watson, 2005). Gradually the mental-rational consciousness became more established in Europe through the Copernican revolution in cosmology; Cartesian dualism in thinking; the Kantian barrier between our interpretive thoughts and the *thing in itself* (Tarnas, 1991); and a materialistic form of scientific empiricism.[8] Synchronously, the Hermetic-scientific sense of an ensouled cosmos—or *anima mundi*—slipped slowly out of sight.

The Materialistic Rationalization and Colonization of Space

Emergence of *Planetary* Space—in the 15th Century

> In 1492, these small, young nations [Spain, Portugal, Britain] set out to conquer the globe, and their adventures of war and death brought the five continents into communication and opened the planetary era, for better or for worse. (Morin, 2001a, p. 53)

The mythic sense of interwovenness between earth and cosmos—and between *inner* soul space and *external* physical space—continued in Europe until the 14th century. This is difficult for us to imagine today with our taken-for-granted understanding of the physical territory of the earth—gained through the discipline of geography; and our exponentially expanding notions of the extent of the cosmological universe—as taught to us by the sciences of astronomy and physical cosmology. Gebser points to the exact moment in global history—in the early 14th century—when someone saw, for the first time, the physical landscape of the earth, from an objective mental perspective, rather than a dream-like inner-soul response. In the same way that medieval humans were afraid to sail too far out from shore so as not to fall off the *flat earth*, humans were also, collectively—according to Gebser—afraid to climb mountains, which we believed were the homes of the Gods. In 1336, Petrarch climbed Mount Ventoux, near Avignon in the French Alps, breaking a cultural taboo, and reaching into the wonder of the new world of the explorers. For Gebser (1949/1985) this represented a fundamental shift into spatial awareness, not just for Petrarch but also for humanity.

> For his time, his description is an epochal event and signifies no less than the discovery of landscape: the first dawning of an awareness of space that resulted in a fundamental alteration of European . . . attitude in and toward the world. (p. 12)

Gebser emphasized his point by quoting the final words of Petrarch's *letter of confession* about his discoveries. Petrarch stated: "So much perspiration and effort just to bring the body a little closer to heaven; the soul, when approaching God, must be similarly terrified" (p. 14). This reflects the spiritual reverence that was embedded in this discovery that marked a turning point in European consciousness about the land. Less than a century later, throughout the 15th century, the Portuguese and Spanish explorers set sail to find new lands, marking the beginnings of the physical expression of what Morin refers to as the planetary era. Morin's view is coherent with Steiner's and Gebser's claims that the new consciousness began to emerge in the 15th century. This new *Age of Discovery* laid the first physical foundations for what we now see arising in the noosphere as postformal-integral-planetary consciousness.

---

[6] Arguably the origins of western science were based on Hermetic science until the 17th century CE (Kepler, 1619/1997).

[7] The *Newton Project* is uncovering, translating and publishing online Newton's previously unknown theological and alchemical writings. http://www.newtonproject.sussex.ac.uk/prism.php?id=1

[8] Alternatives to *materialistic* forms of scientific empiricism have been offered along the way through Goethe's *delicate empiricism* (Holdrege, 2005; Robbins, 2006); James' *cosmological realism* (Gitre, 2006); and Whitehead's process metaphysics (Gare, 1999), yet they have not gained substantial noospheric traction.

Socio-cultural Space—Colonization > Globalization > Planetization

> Human history began with a planetary diaspora across all the continents and in modern times entered the planetary era of communication between fragments of the human diaspora. (Morin, 2001a, p. 53)

Colonization[9] first arose on a grand, planetary, and destructive, scale from the 16th century, as a result of the European expansion into the *new world*. Indigenous cultures around the planet have been—and are still being—devastated, particularly in the three Americas (north, central and south), Australia, China and many parts of South-east Asia. Colonization—and its associated ideology—colonialism, resulted in "irremediable catastrophic cultural destruction and terrible enslavement" (Morin, 2001a, p. 53). A UNESCO research project on this issue currently describes the situation as follows.

> The cultures of indigenous peoples are in danger of dying out . . . These populations number some 350 million individuals in more than 70 countries in the world and represent more than 5000 languages and cultures. Today many of them live on the fringes of society and are deprived of basic human rights, particularly cultural rights.[10]

Globalization is arguably a complex politico-economic and socio-cultural phenomenon, yet its primary expression is through a politico-economic movement of large multinational corporations purportedly contributing to a *trickle-down effect* in global wealth distribution while competing for market share (Deardorff, 2002). There is a secondary transmission of cultural values, which is highly contested. From the perspective of many postcolonial scholars it is a *weapon of mass destruction* of cultural identity and diversity—and has been referred to as the *McDonaldization of the world* (Alfino, Caputo, & Wynyard, 1998; Gidley, 2001d; M. Jain & S. Jain, 2003). Furthermore, the enthusiasm and idealism that pervaded the early geographical exploration of the earth's surface, seems to have deteriorated over centuries to a stale, disenchanted attitude to the as-yet-untamed parts of the earth. Not only are the remaining forests and oceans considered to be simply material resources for the wealthy and powerful to use and abuse, but the endangered and disappearing cultures are, at worst, a cheap resource to exploit in the name of *economic progress* or, at best, a *cultural artifact* to exploit for tourism purposes (Hunter, 2006).

---

[9] The original Proto-Indo-European (PIE) base root was **kwel-* "move around" and this has occurred since the beginning of human habitation of the earth. Even the Latin root *colere* "to inhabit, cultivate, frequent, practice, tend, guard, respect," has a relatively harmless ring to it. Yet, the form of colonization that occurred from the beginning of the mental-egoic period and intensified in the 15th century had the new character of ego-dominance with its attendant *lack* of respect.
http://www.etymonline.com/index.php?search=colony&searchmode=none
Its destructive impact has been deepened through its association with the ideology of colonialism, which claims "some nations, languages and cultures are superior to others, thereby giving them the right to colonize the territory of 'inferior' nations." http://www.penllyn.com/cymuned/papurau/colonization.html

[10] http://portal.unesco.org/culture/admin/ev.php?URL_ID=2946&URL_DO=DO_TOPIC&URL_SECTION=201

By contrast, *planetization*, as conceived by Teilhard de Chardin—and others inspired by his work—may provide a counterbalance to the hegemonic excesses of globalization. The notion of planetization[11] involves not domination but awareness and respect for the richness of cultural diversity. Teilhard de Chardin (1959/2002) refers to planetization as a *mega-synthesis* through which "the outcome of the world, the gates of the future . . . will only open to an advance of *all together*, in a direction in which *all together* can join and find completion in a spiritual renovation of the earth" (pp. 243-245). He emphasized that this cannot by achieved merely by the pressure of *external* forces—such as totalizing governments—but needs to unfold from within human hearts "directly, centre to centre, through *internal* attraction . . . through *unanimity* in a common spirit" (p. 112). He identified several postformal features in the planetization process—increasing *complexity*; the *reflexion* of the Noosphere upon itself; the closing of the *spherical, thinking circuit*; and the *rebounding* of evolution upon itself—a type of complex recursion.

Cosmic Space—*Tellurianization*[12] of the *Kosmos* in the 20th Century

> The overemphasis on space and spatiality that increases with every century since 1500 is at once the greatness as well as the weakness of perspectival man. (Gebser, 1949/1985, p. 22)

After five centuries of exploration and colonization of the planet, the ego-drive to conquer space eventually led to such advanced technology that we began to extend our reach, beyond our home planet into *outer space*. Interestingly, the early space explorations were attended by a similar sense of reverence for the divine, to that felt by Petrarch, over 600 years earlier. Edgar Mitchell one of the astronauts on Apollo 14—the third mission to land on the moon—had the following experience on his voyage home. The following text is an extract from *The Noetic Sciences Institute* website.

> Sitting in the cramped cabin of the space capsule, he saw planet Earth floating freely in the vastness of space. He was engulfed by a profound sense of universal connectedness—an epiphany. In Mitchell's own words: "The presence of divinity became almost palpable, and

---

[11] The distinction I am making between *globalization* and *planetization* is further discussed in the main narrative.

[12] From Latin: *tellus* meaning *earth*. The adjective *tellurian*, means, "Of or relating to or inhabiting the land as opposed to the sea or air." I have created a composite noun from tellurian. http://www.websters-online-dictionary.org/definition/tellurian

> I knew that life in the universe was not just an accident based on random processes. . . . The knowledge came to me directly."[13]

It seems that each new development has begun with reverence and humility, but later is taken over by greed for ego-accomplishment. As part of this colonization of outer space, we have imposed materialistic-earthly-metaphors from classical physics on the cosmos—which previously was regarded as the source of the Divine. While quantum physics has shaken the foundations of scientific theories at the micro level, the full implications of it for theories at the macro level are yet to be adequately explored. Perhaps we could ask ourselves: Is it really appropriate to be spending such massive resources on trying to ascertain whether there is life on Mars, at the very time in planetary history when the human species is at the tipping point of destroying life on Earth? A critical approach to economic theory including global wealth distribution is also required (Eisler, 2007). It is imperative in our current planetary crisis, that we de-familiarize this privileging of *outer* space, particularly when it is so out of balance with our sense of *inner* space (Kelly, 2007). This obsession with conquering and colonizing outer space is an eloquent expression of an overextension of the ego-mental faculties. For the duration of two millennia these thinking powers have tamed and transformed the earth through architecture, road, sea and air infrastructure, and technology. Arguably, these processes of development can be justified as long as they are sustainable, but this is no longer the case. The work of conquering and colonizing the planet is over. The work of caring and nurturing must begin in earnest.

Cosmic Kinship—An Ecology[14] of Evolving Concepts

One way to increase our awareness of our fragile planetary situation might be to foreground the prefix *cosmo*. The following is a deconstruction and reconstruction of some common—and not so common—terms that infer our planetary status as one of kinship with the cosmos. There is an interesting family of terms—including *cosmology*, *cosmogony*, *cosmosophy* and *cosmography*—that deal with knowledge about the cosmos, its origins and the place of humans in it. The term *cosmos* itself originated from the Greek *κόσμος* meaning "cosmos, the world," or in some translations, “a sense of *order*, in contrast to *chaos*.” By a focus on the prefix *cosmo-*, I intend to build stronger conceptual links between our largely anthropocentric, *tellurian* notions of space on the one hand and authentically *cosmic* notions of space on the other. I am endeavoring to pick up leading-edge developments in the evolution of language as it is happening in the world at the present time through a kind of noospheric environmental scanning—or remote sensing.

Cosmos

The term *cosmos* itself has begun to appear in various discourses, with broader meanings than that used in cosmology discourses from the physical sciences. Three new journals have appeared that link the term cosmos or Kosmos with broader issues: *Cosmos and History: the Journal of Natural and Social History*; *Culture and Cosmos: A Journal for the History of Astrology and Cultural Astronomy*; *Kosmos: An Integral Approach to Global Awakening*. It is worth noting that Wilber uses the term *Kosmos* to distinguish his more integral, spiritual notion from purely physical cosmological notions. He has written a trilogy called *The Kosmos Trilogy* —the first of which is published in book form (Wilber, 2000d); Tarnas (2006) has recently published *Cosmos and Psyche: Intimations of a New World View*.

---

[13] Edgar Mitchell, based on the inspiration described here, founded the Noetic Sciences Institute, in California, one of the first educational institutions in the USA for nurturing integral-planetary consciousness. http://www.noetic.org/about/history.cfm

[14] Notwithstanding the illustrious uses of the term *ecology*, not the least by Gregory Bateson (2000) in his *Steps to an Ecology of Mind*, I first came across the phrase “ecology of concepts” in conversations with Gary Hampson, who illuminated and inspired my thinking on this idea.

Cosmology

Probably the best-known term in this cosmo-family is *cosmology*: the study of the structure and changes in the *present* universe.[15] Although this may take the form of mythical, religious or philosophical cosmologies, the *default* usage today would most likely refer to cosmology as a branch of astrophysics. The shift from the unitive hermetic sciences—with their ensouled notions of the cosmos as *anima mundi*—to the starkly materialistic cosmology of 20th century science, was marked by centuries of overlap. As hinted earlier, the founders of modern physical cosmology, Tycho Brahe (1546-1601), Galileo Galilei (1564-1624), Johannes Kepler (1571-1630), Isaac Newton (1643-1727), were all hermetic scientists, who studied the psycho-spiritual-sciences of alchemy and astrology[16] as well as physics. A question that could be posed here is how and why did the more spiritually-oriented hermetic side of cosmology and astronomy become buried under the weight of materialism for two to three centuries?

Cosmogony⇨ Cosmogenesis: From Big Bang to *In*-formed Meta-verse

Perhaps a lesser-known term than cosmology is *cosmogony*. According to NASA the scientific field of cosmogony is distinct from cosmology in that cosmogony is more concerned with the *origin* of the universe.[17] In a similar way to cosmology, there are other theories of cosmogony that are not based on scientific materialism. Questions of the origin of the universe, the earth, life and humanity have, as far as we know, been asked by humans for millennia. Some of these theories of origin are based on spiritual philosophies, as will be discussed below. Perhaps a conceptual bridge could be made here via the transformation of scientific thinking that has occurred as an outcome of the new biological theories arising from chaos and complexity science, and notions of self-organization and emergence. Building on these perspectives, integral cosmologist Brian Swimme (1992, 1999) refers to the emerging shift to complex, morphogenetic and cosmogenetic notions arising from postformal biological models of complex adaptive systems. Swimme builds on Teilhard de Chardin's use of the term cosmogenesis to describe the cosmological process of the creation of the Universe. Teilhard de Chardin (1959/2004) viewed his notion of cosmogenesis as a foundation for the later processes that he called *biogenesis*, and *noogenesis*.

---

[15] For consistency, I am using the definitions for both cosmology and cosmogony from the NASA website. In some notes for teachers the following comment is made. "Observations about the present universe may not only allow predictions to be made about the future, but they also provide clues to events that happened long ago when the chemical evolution of the cosmos began. So—the work of cosmologists and cosmogonists overlaps.
http://genesismission.jpl.nasa.gov/educate/scimodule/Cosmogony/CosmogonyPDF/CosCosmolTT.pdf

[16] Even in Kepler's time, there was no clear distinction between astronomy and astrology (Banville, 1990).

[17] See also earlier note on *cosmology*.

> A cosmogenesis embracing and expanding the laws of our individual ontogenesis on a universal scale, in the form of Noogenesis: a world that is *being born* instead of a world that *is*. (pp. 80-81)

As indicated in the main narrative, diverse theories of evolution hotly contest the degree to which humans with their mental faculties have evolved through random selection, complex adaptation, or *autopoiesis*.[18] Although the new science of emergentism is beginning to discuss the emergence of complex, moral and spiritual dimensions in human nature, this theory is still based on the metaphysical assumption of the primacy of matter, whereby any emergent dimensions are completely *new* appearances.

Steiner, Gebser and Wilber all make significant contributions to this conversation. Although their views diverge somewhat all three share the heterodox idea that prior to matter and the subsequent evolution of matter, there was a spiritual *origin*. In all their views, it could be stated that ontogeny recapitulates not only phylogeny but also cosmogony (Grossinger, 2000, p. 705)

The notion that ontogeny recapitulates phylogeny[19] was developed by biologist Ernst Haeckel in the late 19th century. Anthropologist, Grossinger (2000) takes the view that Haeckel was actually dealing in "information theory[20] and deep structure," (p. 330) but because he preceded structuralism, he clothed his theories in natural science. Such a cybernetic version of recapitulation could be seen to foreshadow the recent scientific notion that a complex invisible dimension is infolded within the material world. Bohm's *implicate order*, Rupert Sheldrake's *morphic field* and, more recently, Laszlo's *Akashic Field*, require further investigation in this regard (Bohm, 1980; László, 2006; Sheldrake, 2006). These theories of an *in-formed* universe, also underpin current meta-verse theories. Laszlo (2007, p. 38-42), citing several metaverse theorists, and Davies, propose that our universe was birthed from a Metaverse—the mother of all universes. Davies (2007) refers to "a family of universes multiplying ad infinitum, each giving birth to new generations of universes . . . With such cosmic fecundity, the assemblages of universes—or metaverse . . . might have no beginning or end" (p. 138).

This endless cyclical aspect of the cosmos is also proposed by cosmologists Paul Steinhardt and Neil Turok (2002) who claim ". . . the universe undergoes an endless sequence of cosmic epochs" (László, 2007, p. 42). It seems that these postformal science theories are bringing us back, full circle, to the cyclical notions of mythological cosmologies. I suggest that there are also parallels between Laszlo's and Davies' theories of a Meta-or Mother-universe—incorporating Laszlo's in-formation rich Akashic field—and Steiner's, Gebser's and Wilber's notions of spiritual *involution*[21] prior to the biological *evolution* of matter (Davies, 2007; Gebser, 1970/2005; László, 2007; Steiner, 1971c; Wilber, 2001b). Such a proposition may point to some fruitful potential for future research.[22]

---

[18] *Autopoiesis* refers to self-organization in a complex adaptive system (Maturana & Varela, 1991).

[19] For an analysis of the state of play in late 20th century biology theory, see Stephen Jay Gould*, Ontogeny and Phylogeny* (Gould,1985).

[20] For Grossinger (2000), Haeckel's ontology was cybernetic and syntactic rather than mechanical. He claims that it was this tacit *symbological* thread of Haeckel's biogenetic ideas that echo in the ideas of Steiner, Freud and Piaget who drew on the developmental metaphor of recapitulation for their cultural, pedagogical and psychological theories (p. 330).

Cosmosophy

Perhaps even less familiar is the word *cosmosophy*, which derives from the Greek combination-*cosmos* and *sofia*, meaning the *wisdom of the cosmos*, with the understanding that the Greek sense of Wisdom was intimately connected to Love. Cosmosophy may also refer to the place of the human being in the cosmos. The notion of cosmosophy, possibly a Hegelian concept, having in modern times passed through Steiner (1921/1985), appears to be undergoing a revival of interest—most notably through Morin—as integral thinkers struggle to find new ways of expressing postformal ideas. For Steiner, cosmosophy was an evolution of cosmology through an inner development that infuses Wisdom with Love.[23] This echoes Morin's *Cosmosophic* perspective, as summarized by Santa de Siena (2005) as "*love for* the cosmos" (p. 435). "In interrogating the notion of eco, Morin opens the *Oikos*, the *common home* of the *living*, a *cosmo-philosophy*, a *planetary* perspective implying the idea of *munus*, of *reciprocity* toward all those who give *us* life" (p. 437). While *physical* cosmology is knowledge of the external physical cosmos discovered through the observing intellect, in Steiner's poetic interpretation, cosmosophy would be knowledge of the cosmos, "which blossoms like a flower in the depths of the individual soul."

> The science which arises from this cannot be measured by its power of abstract reasoning but by its power to bring souls to flower and fruition. That is the difference between 'Logia' and 'Sophia,' between science and divine Wisdom. (Steiner, 1978a)

Contemporary researchers who have begun to recognize the appropriateness and depth of this notion include Come Carpentier de Gourdon (2002), who sees cosmosophy as a way of reconciling scientific knowledge and spiritual culture, and John Toomey (2007), who defines cosmosophy as the confluence between cosmology—as the study of the universe; and philosophy—as the love of wisdom.

Cosmography

Like many of the other terms discussed above *cosmography* also has a *default* scientific meaning. The term is used for "the science that maps the general features of the universe;

---

[21] Sri Aurobindo has also written extensively on the notion of spiritual involution as being intimately interconnected with evolution (Aurobindo, 1909, 2000). Further research in preparation (Gidley, 2007c).

[22] On a somewhat lighter note, it appears that the notion of *cosmogenesis* is beginning to move into wider spheres of culture. A leading postmodern landscape architect is proposing a move towards architecture informed by complexity science and reflecting cosmogenetic principles (Jencks, 1997).

[23] Steiner referred to a three-stage development in this regard. "The progress of humanity is from unconscious [mythic] spirituality, through intellectualism (the present age), to *conscious* spirituality, where the [emotional] and intellectual faculties unite once more and become dynamic through the power of the Spirit of Love, divine and human" (Steiner, 1978a, Lecture I).

describes both heaven and earth (but without encroaching on geography or astronomy)."[24] Clearly, when one begins to speak about *heaven* as well as *earth*, the notion of cosmography can appropriately be broadened beyond science. It is intriguing that we have a well-known term, *geography*—usage of 1,481 per 100 million words[25]—for the mapping or description of the earth[26] yet the counterpart term, *cosmography*, for mapping or writing about the cosmos, is far less used—usage of 3 per 100 million words. Using the etymological root *graphia* "description," from *graphein* "write," the term cosmo*graphy* could be used to refer to how we describe, or write about, the cosmos. This *narratival* sense of *cosmography* is beginning to reflect postformal thinking.

Buckminster Fuller made some inroads into a postformal approach to cosmography with his notion of *cosmic conceptioning* (Fuller, 1992). Recently, social scientists Lesley Kuhn and Robert Woog, have developed the notion of *complexity cosmography*. They draw on concepts from complexity theory—such as self-organization, dynamism, and emergence—to develop narratives appropriate for social inquiry (Kuhn & Woog, 2007). Their complexity cosmographies utilize narratives that are generated through what they call *coherent conversations*—that is conversations that include postformal characteristics such as self-reflexivity, intuition and construct awareness. Kuhn and Woog (2007) are undertaking pioneering postformal research, by taking several key concepts from complexity science—originally formulated as mathematical concepts—and reshaping them in prose, as a basis for social inquiry, e.g., fractal dimensions become *fractal narratives* (p. 177); mathematical *phase space* becomes *phrase space* as a literary device related to construct awareness in narrative and discourse (p. 181). Although they are not using their complexity cosmography to write about the cosmos as such, they are opening up new possibilities for human narratives—fractal, non-linear, recursive—that could provide a template for cohering our complex relationships as humans with the cosmos. Another relevant contribution to a re-enlivening of cosmic conceptioning—to use Fuller's term—is the notion of the *narrative universe*. Although Swimme (1999) and Bocchi and Ceruti (2002) do not use the term *cosmography*, they are indeed writing new postformal cosmographies.

Cosmopolitanism

A postformal-integral-planetary consciousness, as developed in this research, emerges through a re-awakening of the roots of its own being in the archaic, magic, mythic and mental structures of consciousness. Instead of being stuck in the ego-mental space of individualism, territorialism and nationalism, we may begin to appreciate a broader planetary space. If we wish to understand more about our marginalized spirituality, vitality and imagination, we need to step beyond our ego-bound intellectual-mentality and glance at the spirituality, vitality and imagination among the disappearing cultures whom our hegemonic mentality has marginalized. There are indigenous and traditional people on every continent who may know more than modernist western science can imagine, about these other structures of consciousness. This is not a regressive romantic plea or some re-vamped version of the 19th century *noble savage*. It is a conscious integral philosophic stance towards a new cosmopolitanism—an honoring of all cultural treasures. All people need to go through all structures, including ego-mental, to be able to reach a fully integral-aperspectival awaring. However, the emphasis has been too strongly on culturally *progressing* and *transcending*—particularly through techno-economic rather than humanitarian values—with insufficient consideration of cultural *pluralism*, *preservation* and *inclusion*.

---

[24] Cosmography definition can be found at, http://www.websters-online-dictionary.org/definition/COSMOGRAPHY

[25] Word usages are found in the Webster's online dictionary. http://www.websters-online-dictionary.org/definition/COSMOGRAPHY

[26] Geography from Gk. *geographia* "description of the earth's surface," from *ge* "earth" + *-graphia* "description," from *graphein* "write." http://www.etymonline.com/index.php?search=geography&searchmode=none

Such a postformal, integral-planetary consciousness is evident in philosopher Kwame Anthony Appiah's recent book *Cosmopolitanism: Ethics in a World of Strangers* (Appiah, 2006). Appiah appears to successfully steer a course that critiques both the imperializing influence of extreme *liberal universalism* and also the vagaries of *cultural relativism*. His notion of *universality plus difference* echos the ideals of this narrative, and others (Morin & Kern, 1999; Poletti, 2005).

A Neo-Hermetic Renaissance—Reintegrating Micro-Macrocosms

This evolutionary journey of interrogating spatial concepts has pointed to the loss of the perceived unitive connection between the microcosm and the macrocosm, through centuries of scientific materialism. Yet this was a necessary part of the clear formulation of rational notions of the physical components of the universe. However, as a marker of the emergence of postformal, integral movement/s of consciousness, there is a renaissance of interest in the hermetic sciences within the academy. As discussed earlier, both the Newton Project and the Kepler Project are uncovering and researching the extensive theological and alchemical writings of these scientists.[27] In addition, researchers are uncovering and revisiting some of Darwin's original—yet marginalized writings on love and morality (Loye, 1998, 2004; Richards, 1992, 2002). These developments suggest a reintegration of modern and Hermetic sciences—of microcosm and macrocosm—from a postformal noospheric space of fully awake consciousness. These moves are all indicative of Gebser's *concretion of time,* Steiner's *progressive recapitulation*, and Wilber's *vision-logic*, which are to be expected today and have been detailed more fully in Appendix 1. It is illustrative of integral-planetary consciousness breaking through.

Indicators of Postformal-Integral-Planetary Re-Conceptualizations of Space

> Post-modernity can be understood as the loss of terrestrial centrality, of the *dominating uniqueness* of one species, the peripherization and opening to the *living*, the knowing consciousness of *biodiversity*—the beginning of a humanity that gives the Cosmos back to the Cosmos. (De Siena, 2005, p. 426)

A scan of developments in emergent language usage points to significant breakthroughs in the re-conceptualization of space. I have chosen a small number of spatially-oriented terms from the literature that are suggestive of a postformal-integral-planetary consciousness.

---

[27] An additional project is being undertaken on Newton's alchemical writings at the Indiana University in collaboration with the US National Science Foundation http://webapp1.dlib.indiana.edu/newton/index.jsp.

Trans

The prefix *trans*- is a postformal spatial metaphor at least in relation to noospheric space. It is being increasingly used in such contexts as trans-personal (Braud & Anderson, 1998; Ferrer, 2002; Walsh & Vaughan, 1993; Wilber, 1996b, 1996c), transform/transformative/transformation (Earley, 1997; Ferrer, Romero, & Albareda, 2005; Gangadean, 2006b; Grof & Grof, 1989; Hart, 2001; Inayatullah & Gidley, 2000; Montuori, 1997; Schwartz, 1999; Sinnott, 2005; Starr & Torbert, 2005; Thompson, 2001), trans-disciplinary (Gidley, 2002a; Nicolescu, 2002; Volckmann, 2007), and trans-national (Boulding, 1990; Mato, 2000). While not in itself denoting a link to cosmic dimensions, it certainly denotes a mood of expansion. It suggests a movement away from metaphors of *the known* to metaphors of *the something more*—perhaps even transcendence (Bergo, 2005; Braxton, 2006; Cook-Greuter, 2000; Goodenough, 2001; Perl, 1999; Sonya, 1993) or renewed notions of the transcendental (Brun, 2005; Bryant, 2000; Robinson, 2007).

Ecology

Ecology is also a term that is appearing in numerous contexts—ecology of mind, education, commerce, imagination and concepts. Ironically, the Greek term *oikos*[28] is the root of the two concepts: *eco*nomics and *eco*logy. While *economics* in its deficient form—i.e. an economic rationalism that is beholden to corporate greed—is contributing to the destruction of our planetary home, *ecology* is the science that is purportedly trying to save the planet. It carries an integral or holistic sensibility as it concerns the relationships between components within space—sometimes referred to as *connectionism* (Bache, 2000; Berman, 1981; Berry, 1988; Hicks, 1995; Jardine, 1998; Lovelock, 1979; Ornstein & Ehrlich, 1991; Varela, Thompson, & Rosch, 1993).

Planetary

As discussed in the main paper, the term planetary is also increasing in use in a range of discourses (Earley, 1997; Gangadean, 2006a; Montuori, 1999; Swimme & Tucker, 2006). It is almost becoming a household word. This appendix has endeavored to stretch the concept of planetary to include such meanings as planetary crisis, planetary cultures and planetary consciousness.

Noospheric Space—Cultivating Integral Noodiversity: A Personal Perspective

> The new planetary culture can be a shining example of unity-in-diversity, or *unitas multiplex*. It will be robustly diverse, intermixed to the core, and filled with awe at the rich lineages of our common past. (Ceruti & Pievani, 2005, Abstract)

---

[28] *Oikos* is from ancient Greek: οίκος, plural: οίκοι) meaning household, house or family. http://www.etymonline.com/index.php?search=ecology&searchmode=none

> [Morin's cosmosophy] is a *principle of inclusion* . . . to open to the *Oikos*, the life of life, the life of ideas, the existence of all species, in the multiplicity of social, cultural, and logical diversity and specificity, of the different emerging levels and orders of reality. (De Siena, 2005, p. 424)

Although there is an emergence of new integrative material from within both science and the humanities, there is still a predominance of researchers who do not refer to scholarly research from neighboring disciplines. This isolationism makes it difficult for integrative approaches—approaches that do not fit neatly into one discipline. There also appears to be a lack of attention overall in the Anglophone academic world—particularly in the USA—to substantial works that originated in another language, such as German (Steiner, Gebser, Benedikter), French (Derrida, Deleuze, Morin) and Italian (Bocchi, Ceruti, de Siena, Pievani). While some of this relates to translation issues, I propose that some of it is related to a lack of prioritization. In regard to the nurturing of integral noospheric diversity, I wish to draw attention to the notion of multilingualism as an emerging issue that needs to be included on any integral map.

Based on some preliminary field research[29] into the development of integral thought, globally, I have noted that there is an emergent proliferation of integral writings arising from the USA, and also a number of higher education centers developing integral studies. However, much of the literature is strongly American centric, drawing on a fairly local body of research with some of it bordering on ideological territorialism. An exception is the contribution of the California Institute of Integral Studies—particularily Alfonso Montouri and Sean Kelly for the translation and dissemination of Edgar Morin's French writings (Montuori, 1999; Morin & Kern, 1999). By contrast, integral thought is less explicit and tangible in Europe—with the term *transdisciplinary* (Nicolescu, 2002; J. Visser, Barach, John, & Visser, 2007) apparently favored over *integral.* While clearly the roots of American integral theory have originated from European—and/or Indo-European—genealogies, European integral thinkers appear more concerned with negotiating relationships between *national identities* and an emergent sense of *European community.* This manifests as an emphasis on transnational and transdisciplinary research, with terms such as *integral* and *spiritual* being treated with some suspicion.[30] On the other hand, although US integral theorists espouse global and planetary thinking, much of the content focus is quite American-centric. As an Australian, somewhat removed from both these large, powerful geographies, I endeavor to reach as broadly as possible across linguistic, national and ideological boundaries. I challenge all of us developing integral theory to push beyond our tacit barriers, to create an authentically integral, authentically planetary cosmography.

Conclusion—How *Planetary* is Integral Consciousness?

> We are children of the cosmos, but, because of our same humanity, our culture, our mind, our conscience, our soul, we have become strangers to this cosmos from which we were born and with which we must remain secretly intimate. (Morin, 2001b, p. 29, cited in De Siena, 2005, p. 424)

My interest has been to interrogate the concept of space as used in a variety of discourses. This has created a conceptual template from which to ascertain how *planetary* was each of the narratives—both espoused and actual. Steiner (1984c) identified on the one hand the totalizing tendency of ideological intellectualism (p. 40), and on the other hand “the fragmentation of the human family caused by the ideology of nationalism” (p. 44). From these perspectives—as something of a proto-postmodernist—he spoke of the need to strive for “an understanding of multiplicity, of harmoniously working diversity” (p. 37). He seemed to be foreshadowing postmodern perspectives on planetary culture and consciousness and the importance of noospheric diversity. Although Wilber stresses the importance of global and planetary awareness—particularly as part of his concept of vision-logic—it is rather difficult to reconcile this with his lack of substantial engagement with non-Eastern spiritual traditions and 20th century continental philosophy, other than Foucault and Habermas. Gebser’s (1949/1985) phenomenological cultural surveys were broadly cosmopolitan. He also, like Steiner, foreshadowed the postmodern turn by poetically reconceptualizing the concept of *nations* as “dynamic efflorescences of a larger cultural context” (p. 291).

---

[29] I spent three months in the USA in 2005 scanning the various integral approaches operating there. I recently spent several weeks in Europe (2007) with a similar intent.

[30] The complex reasons for European academic reserve in relation to *spiritual* discourse are explored by philosopher Roland Benedikter (2005).

Appendix C: Literacy Unveiled: Art as Language from a Palaeoaesthetic Perspective

Introduction

> More than a heroic history of conquest, according to Telmo Pievani, we may discover that our history is a "cloth made of very fine and multicoloured threads, like a weft of unexpected interdependencies, unknown relations, intertwined roots" (Pievani, 2002, p. 25, cited in De Siena, 2005, p. 410).

This appendix—like the others—is a work in progress. It provides pointers for further research arising from the main paper. It challenges the dominant evolution narrative, which claims that the evolution of consciousness is primarily a matter for classical evolutionary biology. It intimates that the domain of *art*—or *aesthetic sensibility*—may be a more fruitful starting point for the creation of a new *panhuman*[1] narrative for an authentically integral-planetary consciousness. The significance of *art*—rather than *tools*—as a basis for a new semiotically based taxonomy of cultural evolution, has recently been proposed by Robert Bednarik,[2] director of the *International Federation of Rock Art Organizations* (IFRAO) (Bednarik, 2003c). In such a taxonomy, the term *Palaeolithic* could be replaced by the term *Palaeoaesthetic.*[3]

The hermetic sciences—as discussed in Appendix 2—valued art and spirituality as the two pillars that supported its empirical investigations. However, from the 18th to 19th century, when science began to be reduced to a materialistic venture, it lost its connection with art and spirit. Although there is a resurgence of interest in re-uniting science and spirituality, the significance of *art* in this enterprise is still undervalued. A reconstructed spiritual science—as indicated by Steiner—would place art back at the centre of a new epistemology (Steiner, 1964a, 1970, 1928/1972a, 1990b). From such a perspective the evolution of consciousness would foreground the *macrohistory of art*. Gebser (1949/1985) also places art—and particularly poetry—at the foreground of integral consciousness (pp. 316-333, 487-505). Wilber, although he does not

---

[1] The term *panhuman* comes from the Greek *pananthropinon*. It has been used in recent academic literature, particularly in reference to world art (Kimball, 2004) and Greek poetry (Stathatou, 2007).

[2] Rock art scientist, Robert Bednarik, draws attention to the Eurocentrism of much palaeoarcheological research, and nomenclature. He makes the critical point that instead of terms such as Paleo*lithic* and Neo*lithic*—referring to the development of use of stone tools—"a cultural taxonomy derived from art is vastly superior to one derived from tools. After all, tools do not designate cultures; art does" (Bednarik, 2006a, p. 2).

[3] Although *palaeoaesthetics*—or *paleoaesthetics*—is not an area of research in the Anglophone academic world, French art historian, Emmanuel Guy, uses the French term *paleoesthetique* to describe his study of the aesthetic nuances between different palaeoart archaeological sites. http://www.paleoesthetique.com/index.php

SOME RIGHTS RESERVED

foreground art in his practice, does place it conceptually as one of what he calls the *Big Three*[4]—Art, Morals and Science.

The significance of art in developmental and evolutionary theory was already proposed in the mid-20th century by educational philosopher/poet, Sir Herbert Read (1893-1968). Read (1954) proposed that "art—or, to use a more exact phrase, aesthetic experience—is an essential factor on which Homo Sapiens has depended for the development of his highest cognitive faculties" (p. 143). On the basis of this proposition and following in the illustrious footsteps of 18th century Romantic philosopher Friedrich Schiller (1759-1805), Read also claimed that art/aesthetics should be the very *basis* of education (Read, 1943; Schiller, 1795/1977). Read's evolutionary proposition begs the question: Why has art/aesthetics[5] remained—at best—a tangential thread in educational philosophy in the light of its apparent significance as an evolutionary catalyst? I consider this to be a core question in the evolution of consciousness research yet it has received little attention in the dominant discourse until recently.

The study and application of *aesthetics* has been a relatively minor—but continuous—philosophical thread that stretches from at least the Platonic beginnings of Western philosophy up to the present time (Bosanquet, 1892/2005). Interest in the developmental, and/or evolutionary significance of aesthetics—particularly in education—has also followed a similar trajectory. Over the last few decades several postmodern philosophers and postformal education and psychology researchers have begun to point to the significance of art/aesthetics in education and psychological development (Abbs, 2003; Arnheim, 1989; Broudy, 1987; Burnham, 2006; J. Campbell, 1968; Deleuze & Conley, 1992; Derrida, 2001; Gadamer, 1960/2005; Gidley, 1998c; Hutchings, 1999; Jain, 2001; Kaufman, 2005; Kearney, 1998; Kelen, 2002; Kimball, 2004; Koestler, 1989; Kristeva, 1982; Lock & Peters, 1999; Montuori, 2003; Montuori, Combs, & Richards, 2004; Neville, 1989; Nielson, 2006; Palmer, 2007; Pridmore, 2004; Roy, 2006b; Schindler, 1964; Sinnott, 2005; Sloan, 1992; The Mother, 1955; Thompson, 1998; Warren, 1996). There is a point of contention, however, in relation to how art is characterized. Postmodern and critical perspectives claiming that the *high art* industry is elitist (Rose & Kincheloe, 2003; Shiner, 2001) can be contrasted with the more normative—even essentialist—conceptions of art in modernist narratives (Danto, 1986). Inviting a reconciliation, Mitch Avila (Avila, 2003) points to Shiner's seminal book, *The Invention of Art: A Cultural History*, proposing "a healthy pluralism in which multiple forms of arts and crafts—in their manifold richness—can be integrated into a full human life with a diverse range of aesthetic pleasures from the mundane to the sublime" (p. 403). A full scholarly study of these issues cannot be undertaken here.

---

[4] Wilber (1997) expands on his Big Three in relation to his four quadrants. "Sir Karl Popper's 'three worlds' (subjective, cultural, and objective); Plato's the Good (as the ground of morals. . .), the True (objective truth. . .), and the Beautiful (the aesthetic beauty. . .); Habermas' three validity claims (subjective truthfulness of I, cultural justness of we, and objective truth of its). Historically of great importance, these are also the three major domains of Kant's three critiques: science or its (*Critique of Pure Reason*), morals or we (*Critique of Practical Reason*), and art and self-expression of the I (*Critique of Judgment*)" (pp. 71-92).

[5] While I recognize that art and aesthetics could be characterized as distinct domains, this appendix is not the place for such a nuanced conceptual distinction.

The purpose of this appendix is to trace fragments of the evolutionary narrative that have been critically underappreciated—the apparent aesthetic sensibilities of some early hominins and humans. I have bounded this appendix in two ways: by time periods and content. Regarding my temporal delimitation, the focus is on the three earliest of Gebser's structures of consciousness, archaic, magic and mythical—prior to the emergence of the more abstract thinking of the mental structure (c 800 BCE) and the complex thinking of the integral structure (emerging in current times). The mental structure co-arose with more abstract writing in the form of the alphabet (Poletti, 2002), which is regarded as the primary marker of literacy. [6] In terms of content, my primary focus is on the available evidence for aesthetic sensibilities with a further delimitation within this on the semiotic nature of the visual-artistic-language dimension. I will also briefly refer to the parallel—and arguably even earlier—origins of the aural-musical-oral dimension in the evolution of language. However, the latter is a study in itself and largely beyond the scope of this appendix.

An Archaic Unity of Primal Sounds and Images

> We are in a forest near a mighty tree. The sun has just risen in the east. The palmlike tree, from around which the other trees have been removed, casts mighty shadows. The priestess, her face turned to the east, ecstatic, sits on a seat made of rare natural objects and plants. Slowly in rhythmical sequence, a few strange, constantly repeated sounds stream from her lips. . . . Those around her move in rhythmic dances. (Steiner, 1904/1959, p. 82)

Steiner wrote this quote as an imaginative representation of the socio-cultural-aesthetic sensibility that he claimed was already operating among pre- anatomically modern humans. There is still considerable academic contention about the details of human origins. There are two major theoretical positions.

- The *short-range*[7] theory[8] posits that there was a sudden cultural jump, or flourishing, primarily in South-Western Europe, during what is conventionally referred to as the *Aurignacian* cultural period of the Upper Palaeolithic (40,000-28,000 BP) (Bednarik, 2007). This theory was the main theory-in-use in archaeology for most of the 20th century and proposes that very little was going on in human evolution prior to that time, or outside Europe even during that time. It appears to be losing credibility over the last couple of decades since more systematic rock art research outside Europe has been undertaken. It does not seem well supported now in the literature except by some archaeologists[9] and art historians (Klein, & Edgar, 2002; Mithen, 2004; Noble & Davidson, 1996; White, 2003). Some proponents of *Aurignacian* cultural explosion acknowledge that Palaeoart was not just occurring in Western Europe during this period, and also that—in spite of the apparent lack of evidence—it appears likely that human beings have symbolically marked their landscapes over much longer time periods (Chippindale & Tacon, 1998; Watson, 2005).

---

[6] From a 20th century, modernist Eurocentric perspective, the beginning of literacy in a culture, marks the beginning of its history. For a postcolonial critique of the Eurocentrism in the taken-for-granted modernist notions of *literacy*, see the following critiques of the World Bank's *Education for All* agenda (Gidley, 2001b; S. Jain & M. Jain, 2003b).

[7] The short-range theorists tend to use the following terms: *creative explosion*—popularized by science writer John E. Pfeiffer (1983); *"big bang" of consciousness*—introduced by anthropologist Richard Klein (R. Klein, G. & Edgar, 2002); or recently, *symbolic revolution* (Brumm & Moore, 2005).

[8] Although most authors refer to these divergent approaches as theories, Bednarik prefers to call them hypotheses (R.G. Bednarik, personal communication, November 23, 2007).

- The *long-range*[10] theory proposes that the ground was laid for the apparent sudden cultural/artistic emergence over at least several hundred thousand years through protolanguage and the creation of symbolic processes and artifacts. Although the evidence for this has so far only been discovered in fragments, long-term advocates claim that this lack of evidence is a result of taphonomy[11] and geo-cultural factors—such as Eurocentrism and Anglophone bias in the discourse (Bednarik, 1992, 1994). Epistemological support for this theory comes from evolutionary anthropology and psychology (Dunbar, 2003; Dunbar, Knight, & Power, 2003; Foster, 1999; Hodgson, 2000, 2003; Sedikedes, Skowronski, & Dunbar, 2006); art history (Watson, 2005); palaeontology (Conway Morris, 2004, 2007; Teilhard de Chardin, 1959/2002); paleopsychology (Bloom, 2001); and rock art science (Bahn, 1994, 2005; Bednarik, 2003b, 2006b, 2007).

It seems to me that the evidence is shifting in favor of the long-range theories as more evidence comes to light in previously unexamined corners of the globe. As discussed elsewhere, my research points to the need for further research on the proposition that at least some flourishing of consciousness and culture have been associated with major geo-climatic events—such as glaciation cycles—which in turn have been linked by climatologists to astronomical cycles, such as the Milankovitch cycles. (See Appendix 1).

There is also contention in regard to the related question of the beginnings and early development of language. However, most contemporary theorists suggest that some *pre-adaptation* occurred during the pre-human and early *Homo* periods—at least from around 500,000 BCE (Foster, 1999; Kay, 1977; Lock & Peters, 1999). This would seem to support Habermas' (1979) claim that even hominins possessed "a language of gestures and signal calls" (p. 134). Others propose early chorus singing, bipedelism, and the use of *symbolic symbols* such as cave painting as important foundations for the flourishing of language that had developed by the late glacial age (Christiansen & Kirby, 2003). A recent collection of international research on language evolution to some extent meets its claim of being interdisciplinary (Christiansen & Kirby, 2003). However, this collection is primarily conceptualized from within an unproblematized science discourse with its physicalist and classical Darwinian evolutionary underpinnings. New light may be shone on this issue by Steiner's and Gebser's research.[12] As indicated in the opening to this section, Steiner (1904/1959) made the apparently radical claim that these early matriarchs—whom he called priestesses—assisted the development of early language, and even memory, through initiating rhythmical chanting, and interpreting the hidden language of nature—which they expressed in "sound, tone and rhythm" (p. 82). Recent interdisciplinary research on the origins of language via music supports Steiner's claim that, prior to *Homo Sapiens*, proto-language took the form of singing and rhythmical chanting (Merker, 2001; Skoyles, 2000), particularly initiated by the females, as an extension of the mothering impulse (Dissanayake, 2005; Mithen, 2007). In this regard, reference is made to the role of *synchronous chorusing* in the evolution of human language development (Merker, 2001; Wallin, Merker, & Brown, 2001).

---

[9] Actually, archaeologist Steven Mithen's subsequent book appears to take a more long-range view (Mithen, 2005/2007).

[10] The *long-range* theory is often referred to in the literature as the *gradualist* theory, however this should not be confused with the gradualism of classical Darwinism. The long-range advocates allow for a variety of punctuated cultural phases throughout the much longer-term process than 30-40,000 years (R. G. Bednarik, personal communication, November 23, 2007).

[11] *Taphonomy* refers to the "study of the processes affecting rock art after it has been executed, determining its present appearance and statistical properties" IFRAO Glossary (Bednarik, 2007, p. 199).

Gebser (1949/1985) claimed that there was no separation such as we have today between sound and image—that the two streams were interpenetrating. The notion that *nature speaks* has been dismissed under centuries of instrumental rationalism and empiricism, but is beginning to be reconsidered along with the recovery of indigenous epistemologies and shamanic wisdom (Nandy, 2000; Sinnott, 2005). This section focuses on the Lower Palaeolithic period. (See Table C1 below.) The end of this period roughly overlaps with the transition from early *Homo* species to *Homo Sapiens*.[13] Unfortunately, because of disciplinary isolationism, this type of connection is rarely made in the literature. As discussed earlier, only the long-range theorists consider the Lower Palaeolithic period to have any significance for the evolution of culture and consciousness. A long-range advocate, arguably Bednarik has done more than most to research Palaeoart from this perspective as a short selection of his several hundred academic publications demonstrates (Bednarik, 1992, 1994, 1995, 2003a, 2003b, 2003c, 2006a, 2006b, 2006c, 2006d 2007).

---

[12] Although the stated intention of this overall paper is to hermeneutically converse between Steiner's, Gebser's and Wilber's theoretic narratives, Wilber has not to my knowledge developed much material on this aspect of human evolution so my focus is more on Steiner and Gebser.

[13] The origins of the Homo Sapiens species—or anatomically modern humans—is also variously dated within different disciplines at anywhere from 200,000 to 100,000 BCE.

Table C1: Archaeological Cultural Periods from Lower Palaeolithic to Bronze and Iron Ages

"Old World" Archaeological Taxonomy	**Approximate Chronology**	**Descriptions and Geographical Locations**	**Archaeological Cultural Periods**
Lower Palaeolithic	2.5 mya to 180,000 ya[14]	Oldest division of the Older Stone Age of the Old World	*Acheulean*—Old World: Southern Africa to India
Middle Palaeolithic	180,000-30,000 ya	Middle division of the Older Stone Age of Eurasia, Northern Africa	*Mousterian*—Europe, Western Asia and Northern Africa
Upper Palaeolithic[15]	40,000-10,000 ya	Final division of the Older Stone Age of Eurasia, Northern Africa	*Aurignacian*[16] *Gravettian* *Solutrean* *Magdalenian, Azilian*
Mesolithic	12,000-10,000 ya	Middle Stone Age of Eurasia, prior to Neolithic: regional variability	*Mesolithic* is a contested term now because of its Eurocentrism
Neolithic	10,000-5,000 ya	Vague division of New Stone Age: regional variability	*Neolithic* is contested in terms of its meaning as a cultural period
Bronze & Iron Ages	5,000-3,000 ya	Signifying the cultural use of metals such as copper, bronze and iron	*Bronze* and *Iron Ages* are also contestable as cultural periods

Note. Compiled from information in Bednarik (2007), Schriek, Passmore, Stevenson, & Rolao (2007), Seger (2006), and Zong, Chen, Innes, & Chen (2007). See Table C2 for more detail of Upper Palaeolithic.

---

[14] "ya" stands for *years ago*.

[15] For more detail on the European cultural periods within the Upper Palaeolithic see Table C2.

[16] In some classifications what is here called Aurignacian is further divided into Lower Aurignacian—Chˆatelperronian, Middle Aurignacian—Aurignacian, and Upper Aurignacian—Gravettian (White, 2006, p. 270).

Palaeoart[17] from a Planetary Perspective

> It must be borne in mind that the entire region between southern/eastern Africa and Levant in the west and Java and China in the east remains profoundly neglected, in terms of its [hominin] history. Yet we have no realistic choice but to assume that India was occupied for at least 1.9 million years.[18]

As discussed in the main narrative, conventional archaeological models in use for much of the 20th century theorized that human art and culture arose in a sudden cultural explosion, in the Upper Palaeolithic[19] period primarily in South-Western Europe. This claim supported the *replacement theory* that the apparently very primitive *Homo Neanderthalensis* species was replaced by the apparently much more sophisticated *anatomically modern humans*. Contemporary research from the emerging field of *rock art science*[20] has been interrogating the evidence for this model for more than a decade (Bednarik, 1992, 1994, 2003b, 2006a, 2006b, 2007). Bednarik argues that palaeoarcheology has retained a strongly Eurocentric history until relatively recently. The cave art of regions such as *Lascaux* in southern France were for some time considered the earliest evidence of human art—and thus culture. However, as the discourse has become more planetary in orientation, archaeological discoveries are increasingly being made in other locations. Some of the recent discoveries, particularly in India, Australia and Central-Eastern Europe, and of course Africa, pre-date the European sites. Portuguese archaeologist, João Zilhão, has claimed that the diversity of recent discoveries around the globe suggest that, “the corresponding genetic and cognitive basis must have been present in the genus Homo before the evolutionary split between the Neanderthal and modern human lineages” (Zilhão, 2007, Abstract). Several forms of rock art—manuports, use of colored pigment, beads and petroglyphs—have been found to significantly pre-date the earliest European cave art of the Upper Palaeolithic (c. 32,000 BCE) (Bahn, 2005; Bednarik, 2003b; 2006b, 2006c; 2006d, 2007; Reddy, 2006).

---

[17] Palaeoart is the “collective term describing all art-like manifestations of the distant past”. The more specific term Palaeolithic art refers to “the surviving palaeoart of the Pleistocene, from the Lower Palaeolithic to the end of the Upper Palaeolithic” as classified by the *International Rock Art Glossary* (IRAG) adopted by the International Federation of Rock Art Organizations (IFRAO) in 2000 (Bednarik, 2007, pp. 5, 206). The IRAG is published in English, French, German, Spanish and Russian and will shortly also be published in Arabic, Chinese, Greek and Portuguese (R. G. Bednarik, personal communication, November 23, 2007).

[18] The Early Indian Petroglyphs (EIP) Project is a joint venture by the Rock Art Society of India (RASI) and the Australian Rock Art Research Association (AURA) http://mc2.vicnet.net.au/home/eip1/web/eip3.html

[19] See Table C1.

[20] The new discipline of Rock Art Science appears to have been established in the 1980s with the foundation of the Australian Rock Art Association (AURA) in 1983 by Robert Bednarik, who was instrumental in launching the academic journal Rock Art Research in May 1984. In 1988, the first World Congress of Rock Art Research was held in Darwin, Australia, at which the International Federation of Rock Art Organizations was formed, which has grown from an initial nine members, and now has 43 member organizations representing many thousands of researchers world-wide (R. G. Bednarik, 2007, personal communication, November 23, 2007).

Pre-Human,[21] Lower Palaeolithic[22]—Collecting Interesting Manuports

As palaeoart research becomes more accomplished, the discovery and identification of artistic and cultural artifacts takes us into earlier and earlier temporal landscapes. Bednarik has documented archaeological discoveries indicating that the earliest Palaeoart actually pre-dates *Homo Sapiens* and can be attributed to the late Pliocene geological period.[23] The earliest known manuport is the Makapansgat cobble[24] from South Africa dated between 2.5 and 3 million years old (Bednarik, 2003b). (See Figure C1.) Although it is not an example of hand-modification of an object the inherent values implied in the collection of such an iconic-shaped object suggest an incipient form of reflective consciousness. It could be regarded as the first evidence of proto-aesthetic and symbolic thinking in pre-humans (Bednarik, 2007, p. 178).

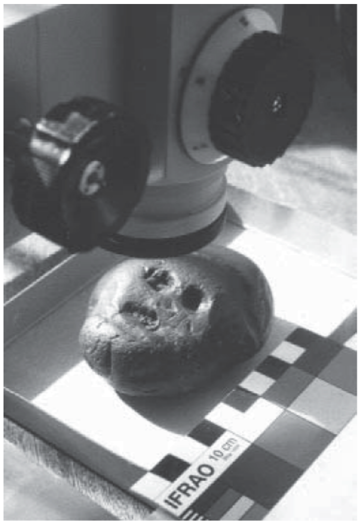

Figure C1: Makapansgat cobble[25]
South Africa > 2.5 million BP

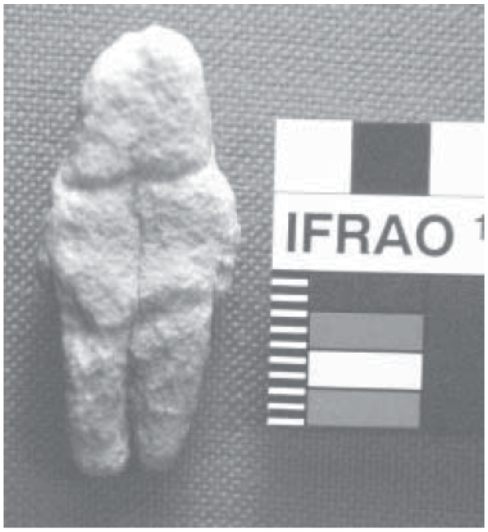

Figure C2: Earliest-known Proto-figure[26]
Tan Tan, Morocco > 300,000 BP

---

[21] It is notable that this discovery is within the contested borderline time period between *pre-Homo* species and *early Homo* species, such as *Homo Habilis* and *Homo Rudolfensis*, who according to fossil records, first inhabited Africa in the Pliocene epoch, a little over 2 million years ago (Lock & Peters, 1999). However, the *Homo* status of these early hominins, is also currently under revision (Key, 2000; Wood & Collard, 1999).

[22] See Table C1.

[23] The Pliocene is the geological period prior to the Pleistocene—also known as the Ice Age—which began c. 1.8 million years ago (Bednarik, 2007, p. 208).

[24] The Makapansgat cobble bearing two or three faces, was reportedly collected many kilometers from the cave it was found in, and carried back to the home base of either *Australopithecus africanus* or a very early hominin, presumably because of its startling natural markings and its red color. First discovered in 1925, identified as palaeoart in 1974 and then in 1998, microscopically examined by Bednarik (2003b, p. 97).

Homo Ergaster/Erectus,[27] Lower Palaeolithic—Coloring, Shaping, Engraving

As an extension of the pastime of collecting interesting objects—and still within the pre-Sapiens temporal range—it appears that *Homo Ergaster/erectus* began to modify iconic natural objects. This may seem remarkable based on conventional archaeological views of the primitivism of *Homo Ergaster/Erectus*. However, evolutionary psychologists claim that the species displayed unprecedented dispersion patterns. Specifically, *Homo Ergaster/erectus* immigrated to many regions of the habitable world (e.g., Middle East, China, Indonesia, and Southern Europe) (Sedikedes, Skowronski, & Dunbar, 2006). While their presence in these places is widely accepted now in archaeological discourse, how they got there is still disputed.

New evidence has come to light—still requiring further substantiation—suggesting that extensive sea-faring may have been undertaken by hominins from as early as 800,000 BP to enable the occupation of Flores in Indonesia and Timor (Bednarik, 2003a). Synchronously, the first use of colored pigment has been traced to around 800,000-900,000 BP in South Africa and possibly India (Bednarik, 2003b, 2006b, 2007); the use of lumps of ochre has been dated to at least 380,000 BP in Southern France with speculation as to its possible use as a *crayon*, or for medicinal purposes (Watson, 2005, p. 28); and also a collection of small crystal prisms has been uncovered in India from a similar time period (Bednarik, 2003b, 2007). Bednarik's claims regarding the symbolic nature of these activities is consistent with recent evolutionary psychology claims that the foundations of language were relatively evolved by approximately 500,000 years ago (Dunbar, 2003; Foster, 1999). This has also been linked with the evolution of self-concept "the human self was already substantively in place by the appearance of archaic humans round 500 kya[28] and hence that its first glimmerings may already have begun to emerge by the late stages of the *Homo Ergaster/erectus* period" (Sedikedes, Skowronski, & Dunbar, 2006, p. 66).

The modifying of iconic objects—a type of proto-sculptural activity—appears to have begun approximately half a million years ago. Some of the most notable are the modified female-shaped pebble from *Berekhat Ram*, Golan Heights, Israel, dated 233,000-470,000 BP, and the human-shaped natural quartzite object, which has been modified by engraved markings and the addition of red pigment from *Tan-Tan*, Southern Morocco, dated 300,000-500,000 BP (See Figure C2) (Bednarik, 2003b, 2006b, 2007). From around the same time c. 350,000 BP a site in *Bilzingsleben*, Germany, consisting of three round dwelling places (Watson, 2005) revealed a variety of engraved objects such as bone, ivory and stone fragments (Bednarik, 2003b). This German site is believed to have been a significant one for *Homo Heidelbergensis*—successful descendent from *Homo Ergaster*, and progenitor of both *Homo Neanderthalensis* in Europe and *Homo Sapiens* in Africa (Mithen, 2007). Synchronously, engraved ironstone slabs have been identified in South Africa (c. 260,000-420,000 BP) (Bednarik, 2003b). These artifacts are particularly interesting in terms of origins in that they appear to have been produced within the extant period of *Homo Erectus*, yet after the emergence of *Homo Heidelbergensis* identified in Africa and Eurasia (500,000-100,000 BP) (Key, 2000; Lock & Peters, 1999; Wood & Collard,

---

[27] What is generally referred to in Palaeoanthropology as the middle *Homo* period was dominated by *Homo Ergaster/Erectus*—who emerged in both Africa and Eurasia, during the Plio-Pleistocene transition (2 million to 200,000 BP) (Key, 2000; Lock & Peters, 1999; Wood & Collard, 1999).

[28] "kya" refers to thousand years ago.

1999). Archaeologist, Mithen, has noted that it was during this period—from approximately 600,000 BCE—that brain size began to increase rather rapidly[29], for the first time since the appearance of Homo Ergaster about a million years earlier (Mithen, 2007, p. 158).

Lower Palaeolithic Petroglyphs

The oldest known rock art, anywhere in the world, has been found only in the last few years in Auditorium Cave in Bhimbetka in India. Very simple in form, with a *cupule* (or small cup) and a long, meandering groove (See Figure C3), it is consistent with the Indian Acheulian[30] age, 290,000 to 350,000 years ago (Bednarik, 2003b). This ancient petroglyph is apparently the first representation of the two archetypal forms—a circle and a line—that the entire world of form consists of. The religious significance of these archetypes continues to be emphasized in more recent times in Japanese Zen calligraphy[31] rituals.

Lower Palaeolithic Pendants and Beads

The earliest manuports were mostly collections of *unmodified* natural objects, or iconically shaped natural objects that have been slightly modified apparently to enhance their iconic form—rather than hand crafted objects. The earliest hand crafted objects that have been found suggest the beginnings of body decoration. They include pendants made from a *perforated wolf's canine* and a *bone point* as early as 300,000 years ago in Austria (R. G. Bednarik, personal communication, November 23, 2007), and ostrich eggshell beads, crafted 200,000 years ago in Libya, northern Africa (See Figure C4). In extensive replication experiments Bednarik has demonstrated the high level of manual skill and patience required to create the ostrich eggshell beads, and has also remarked on the geometrically perfect sense of form that the originators must have had (Bednarik, 2006d).

---

[29] While the cranial size of early *Homo Ergaster* appears to have been in the vicinity of 500-800 cubic centimeters, by the time of *Homo Heidelbergensis*, cranial size appears to have increased to 1,000-1,200 cubic centimeters. A further growth leap had taken place by the time of *Homo Sapiens*—1,500-1,600 cubic centimeters—with *Homo Neanderthalensis* cranial size being even larger (1,600-1,800 cubic centimeters) (Mithen, 2007, p. 159). Arguably, cranial size expansion had ended by approximately 200,000 BP (Hodgson, 2000).

[30] The Acheulian Age is the earliest classified cultural period (See Table C1).

[31] The ritual practice of drawing *ichi* (one) and *enso* (a circle) is part of Zen philosophy as expressed in calligraphy. http://www.mediamatic.nl/magazine/8_4/joshi-letterforms/joshi-3e.html

A Magical Transition—From Primal Sound to Archetypal Image

> Indeed the very obscurity, dormancy, fusion and undifferentiated texture of the primal sounds and roots give us at the very most an intimation of what takes place beyond that temporal limit which exists between the archaic and the magic structures and had to be surmounted during the formation of the primal words. (Gebser, 1949/1985, p. 124)

Gebser's view of the origins of language, suggested a proto-language as many contemporary researchers do. As expressed here, Gebser contradicts the more conventional *compositional theory* of language origins, yet is aligned to more recent theories proposed by Steven Mithen—pointing to the research of linguist, Alison Wray—referred to as the *holistic theory* (Mithen, 2007, p. 3).

From an archaeological perspective the present section focuses on the Middle and Upper Palaeolithic periods, which are the earliest periods during which *anatomically modern humans* began to make their marks on their environment.

Foundations of Speech through Song and Music

> Perhaps the auditory sense is not the first from a physiological standpoint, but it is definitely more prominent in the magic realm than the visual sense. (Gebser, 1949/1985, p. 126)

The aural strand of language appears to have been primary to the visual strand—language was first expressed in song and natural music. As discussed above, human singing, chanting and dancing appears to have predated speech (Merker, 2001; Skoyles, 2000; Steiner, 1904/1959). It is possible that Australian aboriginal *Songlines*, or *Dreaming tracks*, are the closest phenomena we have today to the origins of language through chanting and song.

Earliest known petroglyph in the world, Auditorium Cave, Bhimbetka, dated very conservatively to earlier than 200,000 BP.

[33] *Note.* From *Rock Art Science: The Scientific Study of Palaeoart* (p. 182), by R. G. Bednarik, 2007, New Delhi: Aryan Books International. Copyright 2007 by Robert G. Bednarik. Reprinted with permission.

> Around campfires, they repeat legends of the Dreaming, stories that tell of how their Ancestors created themselves and how they walked throughout the land speaking and singing each object in the natural world into existence, leaving an unbroken trail of spoken words and musical notes along the line of their footprints. (Grigar & Barber, 2004, Abstract)

Songlines were introduced to a broader audience around twenty years ago with the publishing of a popular book (Chatwin, 1987). The songlines not only connect the aboriginals with the land of their ancestors, but deeply with the land itself. The songlines have been described as a type of geographical mapping and communications system between tribes (Grigar & Barber, 2004).

The history of music also predates the written word and presumably first occurred, like synchronous chorusing against the backdrop of birdsong and other animal sounds. It has been argued that Neanderthals began to use rocks, stalactites and other natural objects as proto-instruments to create music (Mithen, 2007). New research on the origin of music appears to be adding some weight to the *long-range* theories of cultural and consciousness evolution (Dissanayake, 2005; Mithen, 2007; Wallin, Merker, & Brown, 2001). The earliest known musical instruments are carved bird-bone flutes from a site in *Geissenklösterle*, Southern Germany, authentically[34] dated by archaeologists, Francesco D'Errico and Graham Lawson to 36,000 BCE (Mithen, 2007).

Archaeologists in China researching the early Neolithic site of *Jiahu* in Henan Province, claim to have found the earliest complete, playable, multi-note musical instruments—resembling flutes (Zhang, Harbottle, Wang, & Kong, 1999, pp. 367-368). However, researchers[35] on this early Neolithic site (c. 7,000 BCE) seem unaware that much earlier flutes have already been identified in Germany. Also these Chinese artifacts need further investigation to authenticate. The earliest Indian flutes—the seven-holed flutes—appear to date from the Indus Valley civilization, along with various early stringed instruments (Massey & Massey, 1996).

Foundations of Writing through Painting and Carving

> Simple non-iconic markings appear in the late part of the Lower Palaeolithic, and they continue to be made during the Middle Palaeolithic. Over an enormous time span they seem to experience some change towards increasing complexity, but their range

---

[34] The authenticity of these artifacts are in contrast to the false claims in 1995 that the world's oldest flute had been found in Western Slovenia and dated at 54,000 years ago. This claim was contradicted by microscopic analysis by archaeologist Francesco d'Errico demonstrating that the perforations were natural and not human-made (Mithen, 2007; Watson, 2005, p. 31).

[35] This project was supported by the National Natural Science Foundation of China [and] the Department of Science & Technology of China, the Chinese Academy of Sciences and the Structure Research Laboratory at USTC. Research at Brookhaven National Laboratory is supported by the US Department of Energy. The full article is available online. http://www.shakuhachi.com/K-9KChineseFlutes-Nature.html

> nevertheless remains remarkably consistent: parallel lines, convergent lines, radial motifs, zigzags or meanders, dot patterns, lattices, circles. (Bednarik, 2003b, p. 102)

The *visual strand* was first expressed in the visual arts by hominins modifying natural objects through coloring with pigment, engraving petroglyphs, and shaping beads apparently for decorative purposes—the earliest of those that have been found were demonstrated above. Petroglyphs continued throughout the Middle Palaeolithic period, and were supplemented at least from the Upper Palaeolithic by cave paintings.[36] (See Table C1 for chronology.) These earlier forms of picture consciousness were followed by pictograms when mythic consciousness began to emerge in the late Neolithic period and into the Bronze and Iron Ages. Eventually, full-writing systems, such as logograms, syllabaries and alphabets emerged with the gradual awakening of ego-mental consciousness, in the first millennium BCE.

Middle[37] Palaeolithic Petroglyphs and Engravings

Prior to the discovery of the Acheulian petroglyphs found in India, as discussed above, it was believed that most petroglyphs were created during the Upper Palaeolithic period. However, Bednarik claims that, for more than hundreds of thousands of years prior to the iconic Upper Palaeolithic cave paintings found in Europe, non-iconic cupules or other patterned engravings were being made on rocks and other available materials. The engraved bone fragment pictured in Figure C5 is from the *Oldisleben 1* Site, Germany, possibly 120,000 years old. It shows two sets of sub-parallel lines engraved with stone tools. A significant type of petroglyph that has survived from the Middle Palaeolithic involves multiple uses of cupules arranged in what is likely to have been a meaningful shape. Figure C6 is an illustration of a large limestone slab from a Neanderthal[38] infant's grave, La Ferrassie, France, bearing eighteen cupules on its underside, most of them in pairs. It is the earliest known rock art in Europe, being from the *Mousterian*[39] period, and most likely 40,000-70,000 years old (Bednarik, 2003b, p. 98).

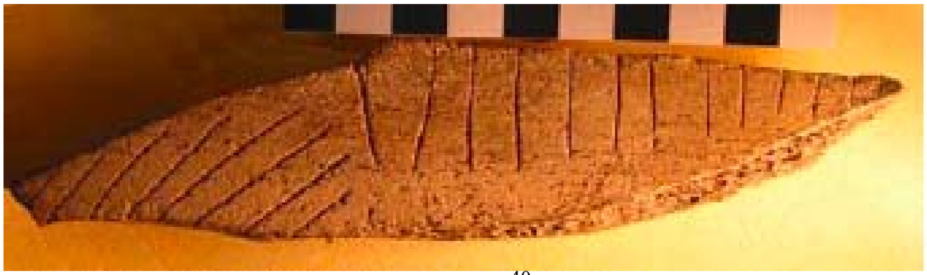

Figure C5: Engraved bone fragment,[40] Germany, c. 120,000 BP

---

[36] It should be noted that although it is believed in conventional archaeological theory that petroglyphs were an earlier form of rock art than cave painting, this conclusion may be a result of taphonomic factors, in that petroglyphs—being engraved in the rock are more likely to have survived the ravages of time (Bednarik, 1994).

[37] See Table C1.

[38] Homo Neanderthalensis appear to have been the first species to ceremonially bury their dead.

[39] See Table C1.

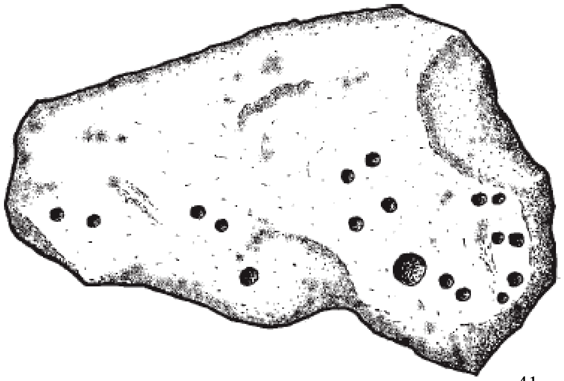

Figure C6: Neanderthal child's grave,[41] La Ferrassie, France > 40,000 BP

Middle/Upper Palaeolithic Rock Art

During the Upper Palaeolithic period in Europe, numerous types of art developed and consolidated that could be regarded as proto-writing—particularly abstract and figurative rock engraving and paintings—as magical consciousness was beginning to give way to more symbolic, image-based forms of expression. Gebser pointed to the features of magical consciousness that can be discerned in the cave paintings, particularly those of the animal hunt, which he claims are predominantly spell-casting and magic in character (Gebser, 1949/1985). The notion of themes related to magic in Upper Palaeolithic rock art is one of a number of interpretations being considered in contemporary archaeology discourse (Conkey, 1999). Because the major focus of archaeological and Palaeoanthropological research until a decade or two ago was privileging Upper Palaeolithic European sites—especially Western European—the taxonomy of cultures that has been developed has nomenclature based on the names of the French sites where particular art was found. (See Table C2 below for summary of the main classifications.) Since the Upper Palaeolithic European cave art, such as *Chauvet* (c. 32,000 BP) and *Lascaux*[42] caves in Southern France are quite well known, this section will focus on presenting some less documented rock art from Australia—some of which occurred within a similar time frame[43] as the oldest of the Western European cave art.

Some of the earliest known rock art outside of Western Europe is sub-continental Indian and Australian. The earliest rock art of indigenous Australians has been found in the limestone caves of Mt Gambier in South Australia, the Kimberleys and Pilbara regions in Western Australia, and Kakadu National Park in Arnhem Land, near Darwin in the Northern Territory. Archaeological evidence demonstrates that Kakadu has been continuously occupied by indigenous Australians for at least 40,000 years and some parts of Arnhem Land as long as 60,000 years.[44] Petroglyphs from Malangine Cave, near Mt Gambier, are believed to be some of the oldest in Australia and are dated at in excess of 28,000 years old (Bednarik, 2003b, p. 94) (See Figure C7). The *Gwion Gwion* rock paintings of the West Kimberleys, in Western Australia, are some of the most outstanding in terms of color and richness and exceptional in terms of their unique style (See Figure C8). Although the dating is most likely within the early Holocene period, because of the technology used, this would need to be classified as Middle Palaeolithic art from the perspective of the European nomenclature.

---

[41] *Note.* From "The Earliest Evidence of Palaeoart," by R. G. Bednarik, 2003b, *Rock Art Research 20*(2), p. 98. Copyright 2003 by Robert G. Bednarik. Reprinted with permission.

[42] The cave art of *Lascaux* caves in France was made famous by French anthropologist and philosopher, Georges Bataille, in his book, *Lascaux or The Birth of Art* (Bataille, 1955).

[43] It should be noted that according to Bednarik in a personal email to me, the European nomenclature is not used in Australia. In addition, he pointed out that if researchers wish to use it then they need to take into account the fact that ALL Australian tool technology up to about mid-Holocene is of *mode 3 technologies*—that is, Middle Palaeolithic. Consequently, most Australian rock art—in excess of 100,000 petroglyphs—is technically Middle Palaeolithic, from the European terminology perspective. From this perspective there is thus *more* Middle Palaeolithic rock art in the world than Upper Palaeolithic (R. G. Bednarik, personal communication, November 23, 2007).

Table C2: Taxonomy of Cultural Periods used for classification of Eurasian Archaeological artifacts during the Upper Palaeolithic

Sub-Divisions within Upper Palaeolithic	Approximate Chronology	Geographical Locations	European Archaeological Cultural Taxonomy
Early Upper Palaeolithic	40-28 kya[45]	Southern Europe and Near East	*Aurignacian*[46] (Named after *Aurignac* rock shelter, Pyrenees, France)
Upper Palaeolithic	28-20 kya	South-western, central and Eastern Europe	*Gravettian* (Named after *La Gravette* Dordogne, France)
Upper Palaeolithic	19-16 kya	South-western Europe	*Solutrean* (Named after the open-air site *Solutré*, France)
Late Upper Palaeolithic	16-10 kya	Western and Central Europe	*Magdalenian* (Named after *la Magdeleine abri*, Dordogne, France)
Final Palaeolithic	11-10 kya	South-western Europe	*Azilian* (Named after *Mas d'Azil*, Pyrenees, France)

Note. Compiled from information in Bednarik (2007, pp. 201-212) and White (2006, p. 270).

---

[44] "Archaeologist Rhys Jones obtained dates for the earliest occupational layers of about 53,000 to 60,000 BP, more probably the latter . . . The oldest painted and engraved surfaces dated back perhaps as far as 40 000 BP, and signs of artists working with ochre paint possibly as far back as 60,000 years ago [at Nauwalabila]." http://www.aboriginalartonline.com/art/rockage.php

[45] "kya" stands for thousand years ago.

[46] In some classifications what is here called Aurignacian is further divided into Lower Aurignacian—Chˆatelperronian, Middle Aurignacian—Aurignacian, and Upper Aurignacian—Gravettian (White, 2006, p. 270).

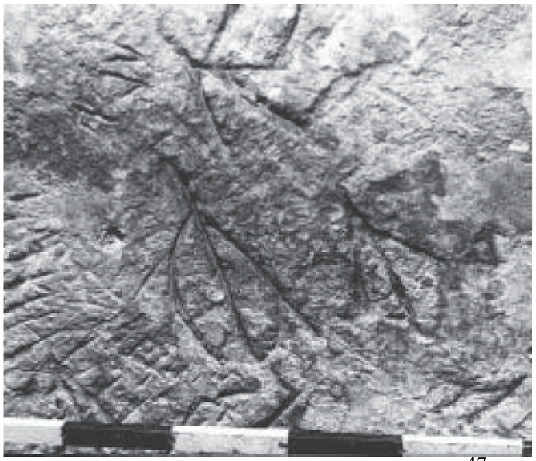

Figure C7: Australian Petroglyph[47]
Malangine Mt Gambier > 28,000 BP

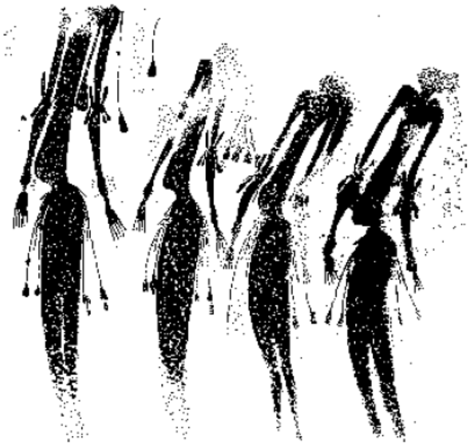

Figure C8: Gwion Gwion[48]
Kimberleys W. Australia 4,000-10,000 BP

Upper Palaeolithic Sculpture and Pottery

The Upper Palaeolithic seemed to also mark the beginnings of what we could call sculpture. This is notwithstanding the earlier examples of enhanced natural objects from the Lower Palaeolithic, which could perhaps be called proto-sculptures. Fully formed iconic sculptures are not found in the archaeological record until at least 30,000 ka—with the exception of the presumed bear head from *Tolbaga*, Siberia, possibly a few thousand years earlier (Bednarik, 2007). The so-called *Venus figurines* of the Eurasian Upper Palaeolithic are the earliest known sculptures but there is much controversy about their dates as well as their meaning. It should be noted that the term Venus figurines is used for a vast collection of artifacts from the *Gravettian*[49] tradition—many of which show no female attributes (Bednarik, 2007). Two notable figurines whose gender has not been questioned are illustrated below. They are of ceramic and ivory, respectively. The *Venus of Dolní Věstonice*—about 11 centimeters tall—is reputedly the oldest known ceramic artifact in the world, dated to the *Aurignacian*[50] period. It was found in 1925 between *Pavlov* and *Dolní Věstonice* in Moravia, Czech Republic, and has been exhibited over the last 12 months at the National Museum in Prague (See Figure C9). The more famous *La*

Dame à la Capuche—also sometimes called the *Venus of Brassempouy*—has been thoroughly microscopically studied and dated to the *Gravettian* (White, 2006, p. 252). This small, 3.5 centimeter ivory sculpture found in Western France in the late 19th century—although technically a bust—is generally also referred to as a Venus figurine (See Figure C10).

Mythic Imagination Threads into Story—Origins of Writing

> It was first hieroglyph, that is, mythically stressed writing and only later a script of sign or letter, that is, mental and abstracting. The meaning, in other words, had to be expressed, most likely by sound and intonation—acoustic characteristics of the magical structure—and only later in pictograph or sign. (Gebser, 1949/1985, p. 156, Note 6)

Gebser claimed—as indicated in this quote—that language development went through a three-stage sequence of *tone-image-sign* that he claimed was echoed in the development of writing. Steiner presented a similar three-stage process in that he referred to the first stage of language development as being related to our early attempts to imitate the sound component of what we experienced in the outside world—expressed as song and music; secondly, that we began to transform the sound experience inwardly into symbolic images—externalized as pictographs and hieroglyphs; only then, from a more abstract conceptual consciousness were we able to conceptually create abstract signs such as alphabets. He also indicated that in the present cultural period we need to move consciously beyond mental abstraction towards a further development of symbolic imaginative conceptions—but it is beyond the scope of this appendix to pursue this claim (Steiner, 1930/1983a, p. 9).

While there are many possible definitions for the concept of writing—the broad definition being advanced here was put forward by Gelb (2004) “a system of intercommunication by means of conventional visible marks” cited in Postgate’s review (2005, p. 276). Linguists tend to identify four main methods of making records or communicating information: pictograms/ideograms, logograms/word-signs, syllabic signs and alphabets (Hooker, 1990, p. 6). Pictograms and logograms began to emerge at the end of the fourth millennium BCE, and developed in several regions during the second and third millennia BCE. They are associated with mythic consciousness by Steiner, Gebser and Wilber as were the early writing systems that combined logograms with syllabic signs—signs corresponding to sounds in the language—in Sumer, Egypt, China and Meso-American Mayan script (Houston, 2004). Alphabets, however, did not emerge until the first millennium BCE, in Greece, building on the Phoenecian proto-alphabet that emerged in Crete a few hundred years earlier (Hooker, 1990; Poletti, 2002). The literature on the origins of writing—like the discourse on human origins—is vast, growing exponentially, and somewhat contentious. Since a full analysis is well beyond the scope of this appendix, I will point to significant recent publications, which can direct the reader to some of the main issues involved.

There are several contested issues in relation to the origins of language:

- The traditional philological notion that proto-writing is merely “a deficient representation of language” *versus* the epistemological perspective that proto-writing is rather a “successful means of representing knowledge and transmitting it” between individuals and generations (Damerow, 2006, p. 2);
- *Mono*genesis—the notion that language was invented only once—*versus poly*genesis—the notion that proto-writing has emerged in different places without direct contact with each other. “The emergence of the Indus script, of Chinese itself, or of Maya writing . . . cannot easily be related to models of monogenesis and diffusion” (Damerow, 2006, p. 2, 9);
- The role of linguistic structures *versus* the role of non-linguistic structures and mechanisms—the latter exemplified in administrative cuneiform, arguably the earliest form of proto-writing (Damerow, 2006, p. 9);
- The role of symbolic, pictorial, representational aspects, as exemplified in the Egyptian and Mayan glyphs, *versus* the more graphic aspects of the Mesopotamian and Chinese systems (Baynes, 2004, p. 172);
- *Taphonomic* factors are significant in all Palaeoart as discussed earlier (Bednarik, 1994) and also to the history of proto-writing, where it is believed that outside of Mesopotamia where clay tablets were used for script, “much of the early script development has been lost because most documents were written on perishable materials (Postgate, 2005, p. 278).

Damerow has created an aesthetically pleasing diagram depicting the major proto-writing phases from a planetary perspective (See Figure C11).

Pictographic/Ideographic Proto-Writing

Pictographic scripts (in which the graphemes are iconic pictures) are generally not classified as complete writing systems. Most linguists claim that a writing system cannot be completely pictographic or ideographic but must be able to refer directly to a language in order to have the full expressive capacity of a language. Although the details of exact chronologies are hotly—and perhaps territorially debated—earlier pictographic writing has been found in Sumer, Egypt, China, Mesoamerica and the Indus Valley regions.

The Indus script (See Figure C12) is a pictographic system that developed between 2700–2500 BCE as the Early Harappan culture transitioned into the Mature Indus Civilization. Around 2000–1900 BCE the Indus Civilization came to an end in the Indus Valley, which led also to the disappearance of the Indus script (Parpola, 2005, p. 31). There were also earlier pictographic forms of writing on clay in Uruk perhaps as early as 3,300BCE, which may have laid foundations for the later wedge-shaped cuneiform (Hooker, 1990, p.19) (See Figure C13).

Still extant pictographic scripts are found among the North American first nation *Micmaq* people, the Aztec *Nahuatl*, and the Sino-Tibetan *Naxi* people.

Logographic and Syllabic Writing Systems

Although preceded by earlier pictographic systems, the following are considered to be the first complete language-based writing systems: Sumerian Cuneiform (See Figure C14), Egyptian Hieroglyphs (See Figure C15), Chinese *Hanji* (See Figure C16) and Mayan glyphs (See Figure C17). The Chinese Hanji—was used for short texts on bronze vessels and in the oracle bone system from the Shang Dynasty (c. 1,200 BCE) (Trigger, 2004, p. 50). In a recent edited book on *The First Writing*, anthropologist Stephen Houston (2004) presents these as the first systematic scripts representing units of sound and meaning. Something of an expert on Mayan script, his claims that the earliest Maya texts are not mere logograms has come as something of a shock to traditional notions of Pre-Columbian Mesoamerican development. He claims that Mayan scripts are as "linguistically equipped, with ergative pronouns, possessive suffixes, and instrumentals, as anything seen in [Chinese] Oracle Bone inscriptions" (p. 351). These four systems all appear to combine logographic, syllabic and determinative features.

[59] Maya glyphs in stucco at the *Museo de sitio* in Palenque, Mexico. This image is in the public domain. http://en.wikipedia.org/wiki/Mayan_glyphs

A significant point of distinction is beginning to be made—in relation to the origins of writing—between the more symbological systems such as Egyptian and Mayan glyphs which show one approach to developing scripts and integrating them with high culture and the more graphical systems such as Mesopotamian and Chinese (Baynes, 2004, p. 172). The recognition of these different types of early writing opens new potential avenues for considering other complex recording systems as writing systems as well—most notably the Inkan *Khipu*.

Cord[60] Re*cord*ing Systems

The *khipu*[61] (or *quipu*) is a textile artifact demonstrating a complex system of different colored cords and knots (See Figure C18). An Italian archaeologist, Laura Minelli, has posited that two Italian Jesuits who had begun the deciphering process, between 1610 and 1638 identified the khipu as a writing system. According to Minelli, the Jesuits claimed, "There were quipus that differed from the ones used for accounting. These so-called royal quipus[62] had elaborate woven symbols, which hung down from a main string" (Domenici & Domenici, 1996) (See Figure C19). The authenticity of this claim is still in dispute. Anthropologist, Gary Urton, refers to Inka *khipu* as "an integrated system of knowledge, skills, and communicative practices that I believe would qualify, in the eyes of most theorists on writing and literacy, as a writing system" (Urton, 2003). He has also deciphered it sufficiently to claim that it was primarily structured as a binary code, like the coding systems used in present-day computer language.[63] This factor seems to suggest that it may have been both a simple writing system in combination with a counting system. This writing system of the Inkas was once thought to have only been in use at the height of the Inka civilization (14th to 16th centuries CE), but recent discoveries in coastal Peru, suggest much earlier. Ruth Shady, an archeologist leading investigations into the Peruvian coastal city of Caral claims that *Khipus* were among a treasure trove of articles discovered at the site, which are about 5,000 years old.[64] This claim will need considerable research to establish its veracity. However, if the claim were found to be valid then it would suggest that the Inkan counting system pre-dated the Babylonian and Greco-Roman counting boards[65] that had already pre-dated the Chinese *abacus* by approximately 1,500 years.

---

[60] It is interesting to note the etymology of the word "cord" as the suffix in the verb "record," from the Latin: *recordari* "remember, call to mind," from *re-* "restore" + *cor* (gen. *cordis*) "heart" (as the metaphoric seat of memory, cf. *learn by heart*). www.etymonline.com

[61] *Khipu* is the Quechuan spelling. *Quipu* is the Spanish spelling. For more information on the current state of academic research, see the *Khipu Database Project*, funded 2002-2004 by the National Science Foundation and Harvard University, and in 2004-2005 is funded by the National Science Foundation. http://khipukamayuq.fas.harvard.edu/DatabaseProj.html

[62] Reputedly, most of the *royal khipus* were burned by the invading Spaniards.

[65] The *Salamis* tablets (300 BCE) were the first known counting boards, and were apparently invented by the Babylonians. They were followed by Greek and Roman counting boards and the medieval European abacus, while the Chinese abacus originated in 1,200 CE followed by the Japanese and Russian. There are

Towards Alphabets

The evolution of the first full alphabet[68] in Greece c. 800 BCE was followed by the Roman version, which is the alphabet used for English and most Western European writing today. Linguists claim that the Greek alphabet developed from Egyptian hieroglyphs through a number of other proto alphabets such as the Proto-Canaanite (c. 1,400 BCE) and the Phoenician (c. 1,100 BCE) (Hooker, 1990). The situation is much more complex though in relation to other writing systems and beyond the scope of this appendix which was intended to focus on *pre-literate* language development through art.

Literacy and Beyond—Future Directions for Language as Art

The above illustrated discussion was intended to introduce a cross-section of Palaeoart and pre-historical artifacts that demonstrate a remarkable degree of aesthetic sensibility—not to mention other qualities and faculties—in early humans and even our predecessors, well before the invention of the alphabet and what is generally referred to as literacy.[69] Up to that point in

---

also suggestions that the Aztecs had a portable abacus as early as 1,000 CE. There are references (in Spanish) listed on the following website. http://www.geocities.com/a1ma_mia/abacus/

[66] A simple khipu most likely used for accounting. This image is in the public domain. http://en.wikipedia.org/wiki/Image:Quipu.png

[67] An elaborate khipu showing different colored threads and variously positioned knots that may possibly have been a Royal khipu. This image is in the public domain. http://en.wikipedia.org/wiki/Image:Inca_Quipu.jpg

[68] Full alphabets consist of both consonants and vowels. Earlier proto-alphabets—called abjads—only consisted of consonants. A similar development apparently occurred in language evolution though much earlier (Foster, 1999; Kay, 1977).

[69] For a postcolonial critique of the Eurocentrism in the taken-for-granted modernist notions of *literacy*, see the following critiques of the World Bank's *Education for All* agenda (Gidley, 2001b; S. Jain & M. Jain, 2003b).

time—around 1,000 BCE—according to the narrative unfolded in the main paper, human consciousness was of a different nature from what it is today. The archaic, magic and mythic, modes of consciousness demonstrated in the previous sections became superceded in many parts of the world—but significantly for European history, in Ancient Greece and Rome where writing based on alphabets began in earnest (Poletti, 2002). Perhaps the most notable feature of the development of consciousness that arose with the intellectual-mental-rational mode of thinking is that it led to the breaking up of earlier more unitive magic and mythical consciousness into what we take for granted now as more or less separate faculties—speech, writing, visual arts and music. Prior to the 1st millennium BCE these faculties and the processes and products associated with them were much more closely interwoven than they are in most 20th and 21st century *modernized* humans—as indicated in the preceding illustrations. The *most* unity was in the Palaeoaesthics of the very early human and the *least* integration between these faculties has been evident in the last two hundred years—with key individuals along the way being multidimensional exceptions. The latter are often referred to as Renaissance men/women indicating the integration of their intellects with art, music and spirituality. The narrative that I have been presenting throughout this appendix and throughout the whole paper points towards an emergent reintegration of these key human faculties—through postformal-integral-planetary consciousness. The future indicated would be one where language again becomes artistic, yet also rich with the conceptual content, organization and clarity that may arise from the integration of aesthetic creativity *and* mental conceptualization.

Conclusion

From the perspective taken in this appendix I invite a deeper appreciation of aesthetic sensibility as one of the core characteristics that distinguishes us as human beings. Anthropologist of art and culture, Ellen Dissanayake has referred to humans as *Homo Aestheticus* (Dissanayake, 2003). Gebser and Steiner both point to the significance of artistic aesthetic enactment through renewed forms of scholarly-poetic writing as part of the new emerging consciousness. Edgar Morin appears to have a similar idea with the use of his term *Homo Poeticus*, (cited in De Siena, 2005). This appendix points to the need for further research in this area. There are multiple theoretical implications that could be drawn from the above data. It is not the place in an appendix such as this to attempt to cohere this evidence theoretically. My primary interest was to present some of the critically underappreciated evidence of the emerging aesthetic sensibility of hominins, and the several phases of aesthetic flourishing that pre-literate humans have demonstrated, as potential contra-indications to the premature theoretical closure of either the *up from apes* biological narratives, or the Upper Palaeolithic *cultural explosion* narratives. Clearly more research and delicate theorizing is needed to enter phenomenologically and hermeneutically into the deeper meaning of this evidence.

Towards an Integral Critical Theory of the Present Age

Martin Beck Matuštík

Abstract: A new model of a critical theory that is integral is introduced. It adds a seventh stage to a six-stage model of critical theory. Building on the model's predecessors, from Kant, Hegel, and Marx to Habermas and Wilber, this proposal is a three-pronged model of material, socio-political, and spiritual critique of the present age. Each dimension is non-reducible to the other. The current model echoes the attempts to bridge social and existential perspectives by early Marcuse and Sartre, and the author's prior work that did this for Habermas and Kierkegaard. This model of an integral critical theory introduces a self-transformational axis, the integer or witness-self, complementing transversally the vertical stages and horizontal states of consciousness.

Keywords: Critical theory, Habermas, integral, model, Wilber

Introduction

A new—integral—critical theory (ICT) of the present age calls for at least three non-reducible dimensions of inquiry and practice, each dimension addressing a distinct field of human needs. My thinking about the possibility of ICT is programmatic in ways it poses its questions: How do we come to terms with economic, political, and religious conflicts in the context of their globalization? And, in response to their global character, how do we integrate the fields of the economy, politics, and spirituality? Answering these questions is a matter of planetary survival, and some preparatory work is in order. In taking such a propaedeutic step in the direction integral questioning opens for us, I describe three distinct and yet interrelated fields of needs and their historical modes of economic, political, and spiritual scarcity. ICT requires us to rethink the fault lines of conflict not as so many clashes of civilizations but rather as collisions of frameworks among material, political, and spiritual levels of development within each civilization and increasingly globally. By "integral" in the context of "critical theory" I mean a theory that includes the three essential and non-mutually-reducible (or orthogonal) dimensions of human existence: material, sociopolitical, and spiritual needs. ICT endeavors to bring together the personal or existential freedom with sociopolitical liberation and spiritual self-transformation.

While there have been schools of thought in other disciplines that chart various integral perspectives on human development, there have not been new or fully successful attempts in philosophy that would bring together the personal or existential freedom with sociopolitical liberation and spiritual self-transformation. Integral perspectives on human and social development were not generally available as a possibility before the notions of biological evolution (Darwin), psychological development (Kierkegaard, Dostoyevsky, Kafka, Piaget, Freud, Kohlberg), and social evolution (Hegel, Marx, Weber, Durkheim, Habermas) were introduced in the nineteenth and twentieth centuries.

SOME RIGHTS RESERVED

Accordingly, I will begin with a brief review of major efforts that pave the way for the very possibility of ICT and next describe the seven stages of critical theory. I will introduce then three fields of human needs and corresponding ideal dimensions of their satisfaction. With the ready-made outline of dimensions, fields, and ideals of ICT, I will chart the basic modes of critical deficit that describe various types of failure of meeting the ideality. Finally, I will show that *integral* critical theory must embody *redemptive critique,* insofar as its motive not only develops a theory with practical intent but also with transformative hope.

Sources of Integral Critical Theory

My thinking about an ICT of the present age does not originate in a vacuum. It has numerous theoretical and practical forerunners, and thus raises both old and new questions. While the notion that the political is personal and the personal is political echoes some of the more recent ferment of the 1960s, in the West we find much earlier ideas for integrating personal and social perspectives both in the Judeo-Christian and philosophical writings. The Jewish Law, Torah, and the early Christian faith embody the communal forms of life that are at once socially and personally transformative. Plato's *Republic* offers a thorough examination of the intrinsic relationship between the twofold founding of justice, that of a just individual (psyche) and society (polis). The Middle Ages achieve an increasing synthesis of these classical perspectives: St. Augustine's *City of God* responds not just to Cicero but mainly to the collapse of the ancient Roman civilization, and the "city" becomes the dominant metaphor of personal-political *Ordo* in its human and divine ordinances. St. Thomas Aquinas erects in his *Summa* an architectonic of a spiritually informed real-politics. And the Jewish, Christian and Arabic scholars in the Golden Age in Spain, e.g., Maimonides, engage in a civilizing, philosophical dialogue among the three religions of the Book.

The precursors to what I call integral critical theory are found much closer to our times. In his early essays from the 1930s, Herbert Marcuse attempted to integrate the existential ontology of Martin Heidegger with the newly discovered humanistic perspective of the young Karl Marx. That attempt, initiated while Marcuse was writing his second doctorate under Heidegger, was cut short by the rise of Nazism. Marcuse joined the Frankfurt Institute of Social Research on its flight into exile and never resumed the project of phenomenological Marxism. It was not until the mid-twentieth century that Jean-Paul Sartre embarked upon a major effort to link in a single philosophical space of theory the existential (personal) together with the sociopolitical (public) perspectives on human development. The accent of the early Sartre in *Being and Nothingness* falls on the personal development, the accent of the late Sartre in *Critique of Dialectical Reason* falls on the social, political, and institutional analysis. These two perspectives, existential Marxism, Marxist existentialism, are like the popular optical illusion showing, depending on one's figure/ground perspective, a duck or a rabbit, and so one can never quite see both at the same time. There were other parallel projects of phenomenological or dialectical Marxism proposed by the Yugoslav *praxis* philosophers, such as by Mihailo Markovic and Svetozar Stojanovic, and by the Czech philosopher Karel Kosík. The Yugoslav experiment in thought had its unreliable companion in Tito's authoritarian socialist regime that morphed after his death into ethnic warfare. Some of the former philosophers of existential praxis became the proponents of the new Serbian nationalism. The Czech idea of existential humanism was promulgated in practice by Alexander Dubček's socialism with the human face, only to be crushed by the invading Soviet army in 1968. What was left of this existential perspective immigrated into the theater of the absurd of Václav Havel who performed it faithfully from his dissident years all the way into his Czechoslovak Presidency after 1989.

In my earlier work (Matuštík, 1993, 2001), I took one small step in the direction abandoned by early Marcuse and unsuccessfully pursued by Sartre. I did so by articulating Jűrgen Habermas's theory of communicative or discourse ethics in conjunction with Søren Kierkegaard's indirect communication underwriting his existential ethics. To be sure, Kierkegaard is able to provide critical theory with an existential dimension of communication that critical theorists of the Frankfurt School tradition for the most part rejected on account of Heidegger's momentary lapse into Nazi activism and more recently also because of the lapse of the Yugoslav *praxis philosophers* into Serbian nationalism. Throwing out the baby of existential perspective with the dirty bath water of nationalism left critical theory too weak to be able to confront the arising religious fundamentalism in the present age. Whether or not one can begin to sketch a critical theory that would give justice to self-transformative and socially transformative perspectives without violence and reductionism, this is no longer an academic question. What is at stake is our ability to come to terms with globalization of socioeconomic, political, and religious conflicts. While social experiments in real existing socialism yielded at least as much suffering as they hoped to alleviate, the reigning neoliberal market ideologies deepen the wasteland left by the previous century. We must learn from their failures as much as achievements, but have we found yet an economic way of life that would not be self- and other-destructive, that would resemble in the material domain what many invoke in their Friday or Sunday prayers? Have we found a political and cultural way of life that would prevent even our best institutions from taking self- and other-destructive paths? Can we say with clear conscience that more democracy has meant less war and exploitation? I pose these as questions, lest someone thinks I easily dismiss the levels of complexity seen in our age and the good-efforts of humanity to meet them. These questions are not rhetorical points for a homily, asking them should not be judged as preaching either. The search for integral thinking and living in the fields of the economy, politics, and spirituality is a matter of global survival.

Seven Stages Toward Integral Critical Theory

While one could name numerous other contemporary sources of or precursors to integral thinking, my most immediate motivating impulse for developing the notion of ICT came from engagement with Ken Wilber's thought in 2006. Because I discovered Wilber rather late, I had both certain distance of a centurion who had never been a disciple as well as independence of years of thinking on the topic with which I came into our dialogue. I want to conclude this review of precursors with two relevant impacts of Wilber's thought on my thinking about integral critical theory.

The first is Wilber's (1997) early engagement with Habermas's critical theory. In my 2001 (xxv-xxvi) biography of Habermas I describe six stages of theory on the way to becoming 'critical.' In my recent engagement with Wilber and other integral thinkers I began to work toward the seventh, integral stage of critical theory, which I introduce in this programmatic essay. To briefly outline the seven stages: First, the Kantian critique of the conditions of possible experience gives us apriori structures that, while as formal perspectives are never experienced themselves, set limits to rational thinking and protect understanding from illusions and contradictions. Second, Hegel, impacted by Darwin and historical consciousness of nineteenth century, taught us that all formal structures or perspectives are themselves developmental, and so while also never experienced as such, they can be grasped retrospectively in their forms of life. Third, Marx discovered that because structures of understanding are not only apriori and developmental conditions of possible experience, but also categories rooted in material career of institutions and modes of economic life, critical theory must not only think possibilities, it must become emancipatory of concrete people and their lived possibilities. Fourth, Western and Freudian Marxists asked the Soviet or orthodox Marxists why greatest critical deficits occurred in the context of revolutionary upheavals of the twentieth century? With Nietzsche and Freud and later with postmodern and literary critical theorists found in cultural studies, they theorized the failure to attend to the depth (hidden, irrational, or deceptively willed) dimensions of human unfreedom. Fifth, early Frankfurt School thinkers, Benjamin, Marcuse, Adorno and Horkheimer among them, learned as much from Western Marxists as from Max Weber and rejected the vanguard hubris of the Soviet and Chinese Marxism, but they retained the emancipatory aims of critical theory. Here belongs also Horkheimer's (1937/1972) classical differentiation of critical, emancipatory theory from traditional, disinterested theorizing. Sixth, Habermas introduces from the late 1970s a communicative model of critical rationality that integrates the elements of Kant, Hegel and Marx and yet reinscribes their achievement within the study of linguistic competences and social evolution. Seventh, ICT adopts Habermas's (1984, 1987, 1992) linguistic-communicative turn and his postmetaphysical standpoint as both a step forward and partial to its own achievement of formal rationality. It is a step forward insofar as Habermas's critical theory explains the apriori structures of understanding or perspectives as grammatical (performative) moves within communicative interaction in which a speaker (I) addresses a hearer (you, we) about something (it) in the world. Habermas is, however, partial to his version of post-metaphysical thinking insofar as he accepts Weber's reduction of all religious development into one of the secularized validity spheres of culture (science, morality and law, and art). In disagreement with Habermas, ICT allows for the possibility of post-metaphysical and postformal spirituality to emerge precisely where he projects a blank vanishing point, that is, under the disenchanted and linguistified conditions of postmodernity. (See Habermas, 1987, figure 28, where the bottom two spaces are left blank, indicating reduction of all sacred contents into profane domains of validity claims. This is precisely where I would theorize in ICT an emergence of postmetaphysical and postformal spirituality.)

Now Wilber adopted the Habermasian linguistic structure of three validity claims and the distinct nonlinguistic rationality of systems theory into the structure of four quadrants. The four holons (the wholes that are simultaneously parts of some other whole) of the integral AQAL perspectival structure (subjective, intersubjective, objective, and inter-objective perspectival wholes) correspond roughly to Habermas's three validity claims of communicative action (intentional or truthfulness speech claims, cultural or normative speech claims, and behavioral or objective speech claims) and the noncommunicative systems rationality (social or inter-objective, functional imperatives of markets and administrative power). At this juncture Wilber and Habermas share all that comes under the sixth stage of postmetaphysical critical theory. The key to my thinking is not what Wilber takes over from Habermas but rather what he impugns to him, namely that his social evolutionary model stops with formal stage of communicative rationality and neither allows for postformal stage of consciousness (read: individual, social, and cultural) development nor for nondual postformal states of awareness. Habermas adopts Weber’s reading of Kant’s three critiques (reason, morality, and art) and Hegel’s three spheres of culture (science, morality and law, and aesthetics). On that view social rationalization of modern cultures resulted not only in a disrupted, fragmented value spheres of expert knowledges (laboratory, jurisprudence, museum and aesthetic criticism), but also in a thorough reduction of the differential rationality-deficit between sacred and profane domains. In brief, social evolution has ushered our age into a thorough postmodern disenchantment with all spiritual or religious claims about subjective, intersubjective, and social worlds. If there has been a line of religious or spiritual development, like the evolution of dinosaurs, it ends with the linguistification of its claims to validity because those very claims are now answered by the expert cultures and the formal (I, you, we) perspectives we can take on all contents (it). Habermas, just like Wilber, integrates post-Darwinian, Piagetian, Kohlbergian, Hegelian models of human evolution but unlike Wilber stops short of allowing for religious evolution after Weber's and generally critical theory's disenchantment with religion. The postformal model of human evolution is, like Habermas’s, based on a reconstructive social science, yet unlike Habermas, it theorizes experience and claims of individuals who already today develop stages and states of consciousness beyond formal rationality. This permits us to raise spiritual claims to existence *after* the postmodern disenchantment with religion; indeed, certain atheism or ”death of God” may be assumed in such postformal and nondual claims.

Nothing in Habermas’s model precludes, Wilber (2001) writes in response to him, postrational stages and states of consciousness because the unfolding of new patterns cannot be read off the accomplished forms of understanding. And so in responding to Habermas’s brand of critical social theory, Wilber boldly calls for an integral “critical spiritual theory.” While Habermas’s “religion or ultimate concern,” is communicative rationality beyond which he finds “no alternative to postmetaphysical thinking,” Wilber proposes to develop “a thoroughly postmetaphysical, post-Kantian spirituality.” And he hopes that this can be accomplished in part within a Habermasian formal framework, as a reconstructive science, yet with new sets of evidence of postrational development offered by those with developmental competence in the dimensions of postmetaphysical spirituality. To sum up my discussion of the seven stages leading up to the ICT, let me cite Wilber’s (2001, Part 1) most important statement about Habermas’s research program in critical theory:

> I consider Habermas [to be] the world’s greatest living philosopher. This does not mean, however, that I agree with all of what he has to say. But in very general terms I do find much agreement with his quasi-universalist approach; his developmental perspective; his dialogical methods; his three domains and three validity claims (art, morals, science—one version of the four quadrants); his championing of the lifeworld in addition to the systems world; his attempt at a reconstruction of the pragmatic history of embodied consciousness; his normative boldness; his blend of both transcendental and context-bound claims; and his critical stance.
>
> I respectfully disagree on many of the details of those broad programs, however; and I strongly part ways with Habermas on his treatment of both pre-linguistic and trans-linguistic realms. Habermas relates humans to both preverbal Nature and transverbal Spirit in ways that I believe are profoundly incorrect. A more integral (or “all-quadrants, all-

levels, all-lines, all-states") approach allows us to handle a much larger view of the Kosmos than Habermas allows.

This brings me to the second area that impacted my current thinking about ICT, my on-line exchange (Wilber & Matuštík, 2006) on stages and states of development. In that conversation I proposed something analogical to my published work on Habermas and Kierkegaard, namely that we introduce an existential dimension into the The Wilber-Combs Lattice (Wilber, 2006, figure 4.1), the integral model of stages and states, and that we do so by drawing a distinct transversal axis that would complement the vertical axis of stages and horizontal one of states. This proposal addresses the question of whether there might be a need for a third, transversal axis, in addition to states and stages of consciousness, in order to account for Kierkegaard's spheres of existence. This is the two-fold background to my question: First, to resume from the previous discussion of stage six of critical theory, Habermas's analysis of social evolution gets us to the amber level of modern and perhaps also higher postmodern consciousness, yet Habermas requires reduction of the rationality differential between sacred and secular, and so requires a translation of spiritual faith-based *mode* of human development into the validity and cultural value *domains of modernity*. In this translation the religious value sphere drops out. Second, Kierkegaard's study of existential spheres admits (with Hegel and so also with Weber and Habermas) that there is no existing religious culture in modernity; there are no Christians in Christendom, though there are nationalist, herd-religious forms and Christians in despair. We are thus required to change the entirety of our sphere of existence. I argued in my book, *Postnational Identity*, that Kierkegaard's transformation of individuals is required by the type of social evolution posited by Habermas, otherwise it falls into anomie and meaninglessness and remains too weak to resist fundamentalist and nationalist modes of individual and group formation (consciousness falls back into tribal-ethnocentric stage).

I agree that we cannot jump the stages of consciousness, or as Habermas, with reference to Hegel's and Marx's developmental theories, would say of social evolution. I also agree with Wilber and against Habermas that the modern Enlightenment reduced all enlightenment to its particular stage of development, and so it now treats all religious states as ego- and ethno-centric, traditional, pre-critical, requiring falsely a full translation of the spiritual into the secular. And the fundamentalist forms of that archaic-cum-postmodern consciousness then clash with the modernist critical view represented, e.g., by Habermas's formal rationality. Iran's treatment of its philosopher Ramin Johanbegloo, who likes to quote Habermas among others, is the case in point (Matuštík, 2006). But I want to hold that we need, besides the vertical axis of stages and the horizontal axis of states also the transversal, or genuinely vertical-inward axis of existential self-transformation. It is true that one cannot jump the stages, but in a non-evolutionary sense the spheres of existence, as shown by Kierkegaard, are available to everyone at every stage of consciousness. Yet existence spheres are not exactly the same as states of consciousness. Kierkegaard criticizes Hegel for confusing transition with transformation, evolutionary developmental dialectic of both-and with existential transformative dialectic of either/or. We need to posit in contrast to Hegel-Marx-Habermas-Piaget-Kohlberg-Gilligan, etc. and their evolutionary models, something akin to Kierkegaard's existential spheres of existence (esthetic, ethical, ethico-religious, generic and higher level-religiousness) as a motivational-inward prerequisite for the very possibility (condition of possibility) of evolutionary change. And since states are not the conditions of the emergence of stages, then we cannot speak of spheres of existence simply in terms of states either. My model of ICT assumes that we can introduce a three-pronged lattice or axis with stages and states of consciousness and spheres of existence. Enlightenment is vertical (stages of conscious and social evolution leading to the fullness of content), horizontal (states of possible awareness receding to the emptiness of form), and transversal (existential spheres moving ever deeper to the awakening of spirit in the witness self).

Three Fields of Needs, Three Dimensions of Ideal

Beginning with the seventh, integral stage of critical theory, let us imagine a triangle: At the base of the triangle are material needs (IT as represented by the objective behavior and body and inter-objective functional systems of markets and administration) and social-political needs (YOU/WE of intersubjective and cultural interaction), at the top are self-transformative or spiritual needs (I-I no longer as a metaphysical soul or transcendental ego but as an integer and existential witness, awareness within stages and states of consciousness). Speaking of needs and dimensions of ICT indicates that critical theory must operate in both incarnate and ideational modes. The needs represent the basic nourishment necessary for sustaining the very human existence. Each type of nourishment has its own field for growing and harvesting. Ideals become critical tools when we lack certain needs, and the time and place where one stands while envisioning what one lacks in the present condition is not a field but a projective dimension (*utopos* has no place or field, yet it exists in a dimension of ideal, hope, waiting, possibility). Any impetus for transformation of the field of needs thus comes from the recognition of the dissonance between the reality and the ideal, thus from the material, political and cultural, and spiritual dimensions of critique and possibility.

One field of ICT pertains to *material needs* and resources for their satisfaction. Its corresponding dimension encompasses *critique of political economy,* whereby it articulates vehicles for just economic distribution of material resources for the satisfaction of bodily needs. Another field concerns *social and cultural needs* for recognition and institutions for their expression. This dimension of ICT develops *critique of society*, whereby it seeks political vehicles for social integration, democratic participation, and cultural reproduction. The third field articulates ultimate concerns or hope—*spiritual needs* for the self-transformation. The dimension of *spiritual critique* in this field is to unmask not only the secular but also the religious idolatry *of finite absolutes*. In this triple approach, an ICT would promote ways of human self-transformation, practices aiming at spiritual liberation, and communicative channels to redemptive hope.

No one field of needs can be satisfied by another field (any such attempt would lead to suffering and violence); hence no dimension of critique can be overtaken by another dimension (any such attempt would lead to ideological reductionism). Material scarcity can be overcome by social justice, while the scarcity of recognition is met by reducing the democratic deficit in social, political, and cultural institutions. The scarcity of hope can be overcome neither by economic nor political means. Political economists, critical social theorists, and social activists presuppose hope for their work but do not have access to its renewable resources. The ultimate concern or hope is not like addressing an inconvenient political truth about the climate and energy decline, e.g., by converting soybeans into biodiesel or switch grasses into ethanol. Hope is not the same as hopes, one can have ultimate concern, hope (verb) yet one must not project one ultimate something, a hope (noun). As Rabbi Cooper (1997) says, “God is a verb.” No critical theory can get off the ground without hope in the verbal, active, performative sense, yet this dimension is recovered only within the seventh stage of critical theory that integrates material and sociopolitical hopes with redemptive hope. The scarcity of hope calls for a redemptive dimension of critical theory (Matuštík, 2008).

ICT addresses three non-reducible *fields of human needs*—material, social and cultural, and spiritual—developing *three dimensions of critique and possibility*—political economy of social justice, politics of recognition, and ultimate concerns for self-transformative and redemptive hope. These are laid out in Table 1.

Table 1. Dimensions, Fields, and Ideals of Integral Critical Theory

FIELD OF NEEDS	*DIMENSION OF CRITIQUE*	*REGULATIVE IDEAL or POSSIBILITY SOUGHT*
1. material needs	critique of political economy	social justice: economic redistribution of resources
2. social & cultural needs	critique of society	deliberative democracy: political & cultural recognition
3. spiritual needs	critique of secular and religious idolatry	redemptive hope: spiritual liberation & existential self-transformation

The Basic Modes of Deficit

When fields, dimensions, and their projected idealities are conflated or reduced into one another, major deficit and even violence may occur. I introduce some *basic deficit modes*, where in the following "-" indicates a deficit and “+” a reduced (truncated) addition of a field or dimension of ICT. For example, "(2) - (1) + idolatrous (3)" means a perspective that focuses on sociocultural needs, does not adequately consider material needs, and supplements with an idolatrous interpretation of spiritual needs.

(2) - (1): If we try to meet social and cultural needs without attending to the material needs, we get *an economically deficient model*. Safeguarding democratic institutions, access to opportunity, and even political pluralism and multiculturalism, yet doing so without addressing the material conditions for their very possibility yields the economic deficit of bourgeois liberalism. For example, Hegel formulates in his *Philosophy of Right* a social ideal of a rational state in which he reconciles various modern conflicts, such as those between the individual rights and social duties, by envisioning a higher-level ethical whole. In such a higher-level whole, the individual finds his or her fullest self-expression in and through the social institutions of the state, not against them. Yet Hegel, against Kant who proposed before him the League of Nations and even perpetual peace for the end of all wars, leaves all nation-states in the international state of nature in their mutual relations, each state exposed both to hunger and war. Poverty, class-based racism, gender ceiling, and international struggle among warring nations are all conceded as necessary evils by Hegel’s ethical state as well as by the other great modern theorist of political liberalism, John Rawls.

(1) - (2): We get *a politically deficient model* if we reverse Hegel's ideality and focus on the economy alone without safeguarding the institutions of the lawful state. This deficit is best exemplified in the Soviet Marxism or Stalinism. Of course this deficit can plague both classical market liberalism that has but few minimal legal protections against wild markets and neoliberalism that has taken away as many of such protections as possible. This is the meaning behind calls for the withering away of the state (Lenin) as well as for starving the state with reducing social spending (market liberalism). The protests against the lack of political and representative democracy in the World Trade Organization on the other hand call for more political transparency. In state socialism (defined by Webster as *etatism*) state becomes a badly run corporation and all citizens are at its mercy as its employees without any independent legal protection. Without deliberative democratic institutions and sociopolitical recognition, the markets and attendant corruption rule by their not so invisible hand, as we see in many a post-Communist country today. Before them, the party directives for economic redistribution relied on models of social totality. All real existing socialisms, not just the Soviet and Chinese Marxism, tended to reduce political, legal, and multicultural sphere to the economic. Just as Hegel balked at Kant's hope for perpetual peace in the League of Nations, so Marx, unlike Hegel and Habermas, never saw the need for a philosophy of right.

(2) - (1) + idolatrous (3): Take the economically deficient model and add to it an idolatrous form of religiosity. The major difference between secular political liberalism and *religious conservatism* does not lie merely in the economic sphere to which they tend to be inattentive (or which they treat with minimalism), but rather in their pseudo-religious means of legitimating and justifying persisting social inequalities. Idolatrous religiosity elevates as ultimate one or another political or cultural or economic need. Dostoyevsky's literary figure of the Grand Inquisitor describes idolatrous satisfaction of spiritual needs. Moral majorities and televangelists, whether among the believers or from the bully pulpits of churches, mosques, synagogues, and political parties, emulating the Grand Inquisitor, offer the angry and pliant individuals and masses false redemptive hope, for they promote vengeance against and fear and envy of the hated other.

(1) - (2) + idolatrous (3): Take the politically deficient model and add to it an idolatrous form of religiosity. Insofar as the cults of personality in Stalin's Russia, Mao's China, or Castro's Cuba replaced, and so stealthily supplemented, the ultimate human concerns, they exemplified *in that field* the worst Caesaro-papist excesses also described by the portrait of the Grand Inquisitor. The secular idolatry of the party or progress or personality cult (the ultimates or practico-inert absolutized hopes supplied by to so-called atheistic states) differs only in kind from the religious idolatry of conservative religious-moral majorities in developed West (the ultimates or practico-inert absolutized hopes supplied by nationalist or state interests). While the deficit of the model *(1) - (2) + idolatrous (3)* can justify someone to claim that 9/11 was God's punishment on the sins of homosexuals and feminists in America; the deficit of the model *(1) - (2) + idolatrous (3)* justifies violent revolutionary means of the present as a necessary sacrifice for the secular-cum-divine future to come.

(3) - (1) - (2): The model that jettisons both the economic and the political needs and tries to meet both spiritually yields myriad forms of *religious oligarchy and theocracy.* These modes of incarnate (economic and political) deficit within the religious forms of life entrench priestly or other religious elite, which then lives from natural wealth and the toil of the poor it serves. All

along the elite cult imposes on the people strict codes of behavior, perhaps exhibiting more of a drive for power than for the divine. These deficit modes are rare in the West ever since the end of the Middle Ages. But they define a great part of the Middle and Far East. The Shiite Ayatollahs of Iran or the Saudi Arabian Sunni rulers could care less for their own poor or even for the poor Palestinians, whether these poor happen to be Muslim or Christian believers. The impact of a religiously informed ICT would be to speak as powerfully to established Islam*ist* order today as Kierkegaard did to the powers that be in Christendom, to develop a religious critique of certain spiritlessness, to ask where are the Muslims in Islamdom? A religiously informed ICT would unmask any notion of a "holy land" as a piece of a prized real estate that must be won at all cost, even that of social and economic oppression.

(3) - (2) + supplement of (1): When religious groups attempt to satisfy material needs while suppressing political freedom, we get a postsecular convex mirror of the state socialist or *etatist* deficit model. *Fundamentalist religious movements* try to meet the material needs of economically oppressed and politically unrecognized groups through institutions of social welfare, but they bind the hearts of the masses with strict adherence to a religious-nationalist doctrine. The success of Hamas or Hezbollah mirrors the initial success of the welfare policies in the Communist East, perhaps also those of the Kibbutz movement (both socialist and religious) among the early Jewish settlers in Israel. The success lies in their program of economic sharing and redistribution. Religious fundamentalists and the orthodox vanguard (whether on the Left or on the Right) alike suffer from democratic deficits. The secular idolatry of the Communist cults differs only in kind from the religious idolatry of fundamentalists.

But There Are Alternatives!

One often hears from the liberals that there is no political alternative to modern democratic institutions, and so, we hear, we must learn to live with some economic deficits and even with war. One often hears from the leftists that there is no just economic alternative to commanded (revolutionary) redistribution of material resources, and so, we hear, we must learn to live with some democratic deficits and even with class conflict and the transitory dictatorship of the poor. One often hears from religious conservatives, fundamentalists, and even many a sincere believer that there is no spiritual alternative to their real existing religion, and so, we hear, we must learn to live at times with economic and at times political deficits and even with ensuing religious conflicts.

TINA—there is no alternative—is a condition of paralysis, a failure of imagination, thinking, and hope, cancer affecting all three fields of needs, dimensions of critique, and ideals sought. TINA has been originally formulated in the field of material scarcity and its dimension of economic critique as a claim that there is no economic alternative to the economy shot through with some social injustice. But, secondly, one could speak more specifically about material, postmodern, and postsecular forms of TINA.

The postmodern TINA condition affects the field of the political and its scarcity of recognition and social critique. It is the claim that there is no alternative political narrative and thus viable ideal of liberation. The postmodern TINA condition expresses the scarcity of critical resources (it asserts the impossibility of formulating normative critique and liberating narratives).

Thirdly, the postsecular TINA condition affects the field of the spiritual and its scarcity of hope and requisite critique of secular and religious idolatry. It is the claim that there is no religious alternative to the scarcity of hope. The postsecular TINA condition aggravates the scarcity of hope, namely the sinking sense that no alternatives exist to fundamentalist and secular wastelands of the present age.

The reductionisms of analysis of human needs and the deficits of critical thinking about alternatives have crippled experiments in economic, socio-political, and religious change affecting the last two centuries. The human race has been producing unparalleled economic, political, and spiritual wastelands in the last hundred years. The productivist, functionalist, and technological paradigms of thought and action have dominated both the evolving capitalist mode of production and real existing state socialism that just wanted to best it. The inconvenient truth about industrial socialist experiments is their ecological devastation carried over to the wild free-market economies in the post-Communist East. The fear of open thinking and exchange of ideas in the East and the market manipulation of the liberal field in the West have produced several generations of people incapable of thoughtful democracy. The Chinese economic miracle is underwritten by Western internet companies willing to close off free access to information. The authoritarian political models are the preferred ones from Asian economic tigers to Islamist theocracies to Bush's America. Wastelands of spiritlessness in modern times (just like any serious ecological devastation) are scary in that they might be irreversible—from outright annihilation of religious life and ancient wisdom traditions not just in Russia and China but also in Albania or in the most atheistic of European countries, the Czech Republic, to spiritlessly reactive world-religious formations of rising Christian, Jewish, and Islamist fundamentalism.

My programmatic thinking about the possibility of ICT had but one aim, to begin to come to terms with globalization of economic, political, and religious conflicts and from it the emerging need to develop serious integral thinking and living in the fields of the economy, politics, and spirituality as a matter of global survival. In taking a step in this direction, I described distinct fields of needs and their historical modes of economic, political, and spiritual scarcity. In relation to the incarnate fields of needs, I distinguished corresponding ideal or redemptive dimensions of transformation from which alone any critique of the present gets its impetus. Would we be able to recognize our fields of scarcity without a dimension of anamnesis (recollection of the dangerous memory of our future) or without an existential repetition forward of our possibilities (active, redemptive hope)?

I showed how the deficits result from the reduction of fields as well as dimensions of inquiry to each other. The regulative idealities yielded the triple disenchantment housed in the reductionist claims (theories, ideologies, forms of life) of economic, postmodern, and postsecular TINA. The best work done today in each field of needs, dimensions of critique, and redemptive idealities is the integral thinking in which there has transpired an astonishing learning curve from the past and present failures. To mention just a few very specific examples: Addressing material needs, Schweickart (2002) dares to think about alternative economic institutions *after* the failures of state socialism and capitalism. His ideal is stimulated, among others, by economic cooperatives of Mondragon, Argentina's bankrupt companies that were saved and rejuvenated by their workers, as well as China's hybrid environment of postcapitalist attempts at economically viable socialism. In the area of struggle for recognition, the late rapprochement between Jacques

Derrida's impossible hope invoked as religion without religion, the works in feminist and race theory, and Jürgen Habermas's communicative paradigm of morality, law, and democracy all stimulate thinking about institutions that could accommodate our multicultural lifeworlds. Beyond the skeptical postmodern claims, a new critical postmodern theorizing is at once normative and self-limiting (see Matuštík, 2001, 2008, part 1 on Derrida and Habermas). Finally, we are hoping against hope because we live in the crisis of idolatrous ultimates or under the conditions of the "death of God." There is growing a worldwide community of thinkers and meditation practitioners, theorists of developmental studies and integral spirituality introduced models of stages and states of human development suited for understanding the inward dimension of global human flourishing. Beyond the postsecular claims of aesthetic religiosity and secular idolatry, integral spirituality introduces post/modern stages and states of consciousness that envision the divine as at once opening the doors to social justice, multicultural worlds, and the priority of one's inherence in spirit over the adherence to doctrines.

There is one astonishing implication of taking steps in the direction of ICT: What we are suffering in the twenty-first century is neither solely an economic class war, nor Samuel Huntington's clash of civilizations, e.g., between modern West and traditionalist Islam, nor simply religious wars. The revolutionary subject of true human needs, critique, and hoped-for ideals is not to be sought along one single trajectory: either economic or political class or orthodox religious brand-names. ICT requires us to rethink the fault lines of conflict as collisions of frameworks among material, political, and spiritual levels of development. Such collisions arise both from disturbances within the frameworks and in hegemonic struggles among them. The economic analysts need to focus on models best suited to local and global justice. Political theorists and social critics cannot resolve market efficiency and distribution questions, but they must develop legal and political safeguards for deliberative practices and social recognition. Economists and political theorists, whether secular or religious, should in their domains hold their tongues about ultimate concerns. Marx was not the first, Bush is not the last who misspoke from left or right sides of their mouths on religion. It is always disastrous when politics cross-dresses in religious costumes, or when religion underwrites politics, or when economic welfare buys religious adherence.

Illuminating the Blind Spot:
An Overview and Response to Theory U

Jonathan Reams

Introduction

There have been numerous attempts to make a contribution to the conversation about how we can make the world a better place. These cover a full range of approaches including scientific, political, economic, social, new age consciousness and so on. Many of these attempts focus on the value of seeing the world through the lens, discipline, doctrine or ideology of a particular approach, and thus advocate for the primacy of that approach. In other words, they preach the latest gospel that can bring salvation to a troubled world.

To see the world as a troubled place is not hard. In fact, many would say that if you saw it otherwise you must be blind or seriously in denial. And so efforts to make the world a better place are a response that arises in many forms. The question then arises; what would an integral approach have to offer? How might it go beyond any particular ideology, discipline or doctrine? What if instead of creating models responding to the ongoing problems of the world, we looked at illuminating the blind spot lying within such models, and generated a more comprehensive framework for seeking to understand the underlying processes behind change itself? This is one way to look at what Otto Scharmer has been working on with the development and publication of *Theory U. Leading from the Future as it Emerges. The Social Technology of Presencing.* (2007. Cambridge, MA: The Society for Organizational Learning, Inc.). It can be seen as a way of understanding the underlying processes behind deep change, and of enabling the enacting of such change processes.

In this essay, I will present a substantial overview of Scharmer's new book. The aim of this overview is to give readers a good feel for the scope and depth of this book, (even entice them to read it for themselves), as well as to set the stage for my own comments that follow. These comments will offer responses on two levels; one focusing mainly on cognitive development concerns and how they might have implications for his work, the second focusing on combining some specific points in Theory U and their implications with my own views and pointing to a perceived tension and possible blind spot.

A Whirlwind Tour of Theory U

My plan is to invite you along on the journey I took in reading this book. I will describe the work as I encountered it, chapter by chapter. I will summarize the main points and try to weave together a picture of how Scharmer unfolds his view. He covers a great deal of territory, so settle in for a long journey.

Introduction

The introduction to the book lays out the scope of territory that will be covered. Scharmer begins with a discussion of social inequities in the world, and describes current trends as pointing to a crisis in our society that is making the old forms of institutions and social

SOME RIGHTS RESERVED

structures obsolete. He sees them as falling apart, and in the midst of their rubble, something new has the possibility to arise. “What I see rising is a new form of presence and power that starts to grow spontaneously from and through small groups and networks of people” (p. 4). This is the new social field Scharmer sees emerging, and he sees the blind spot of this or any social field as “the place within or around us where our attention and intention originates” (p. 6).

His insight to this blind spot is derived from Bill O’Brian’s observation, derived from years of studying and practicing organizational learning efforts, that the “success of the intervention depends on the *interior condition* of the intervener” (p. 7). From this, the underlying question Scharmer poses is: “How can we act from the future that is seeking to emerge, and how can we access, activate, and enact the deeper layers of the social field” (p. 8)? Thus Scharmer lays out the core issue that his work revolves around.

Scharmer also opens by drawing on his farming background, using the term “field” from this context as a metaphor to describe how he views the “*field structure of attention*” (p. 10). The combination of the two elements above (our interior condition and acting from the future seeking to emerge) leads him to working with this “field structure of attention” as the mechanism that links what we say and how we act with where we operate from, or our blind spot. He begins to point to the ways in which consciousness (where we operate from) creates experience as the process or principle in operation in the construction of social fields. “The same activities can result in radically different outcomes *depending on the structure of attention from which a particular activity is performed*. Put differently, “*I attend* [this way] – *therefore it emerges* [that way]” (p. 13). This distinction leads Scharmer to delving deeply into how our attention is and can be structured as a major portion of the book.

Once this foundation is laid Scharmer sets out to build upon it and has three aims for book:

1. To provide a social grammar of the social field that illuminates the blind spot.
2. Exemplify this grammar by revealing four fundamental metaprocesses that underlie the collective process of social reality, moment to moment: thinking, conversing, structuring and globally connecting (global governance).
3. Outline a social technology of freedom that puts this approach onto its feet and into practice through a set of principles and practices of presencing.

This leads to a call for “discover[ing] a more profound and practical integration of the head, heart, and hand—of the intelligences of the open mind, open heart, and open will—at both the individual and collective level” (p. 20).

Part I: Bumping into Our Blind Spot

Chapter 1: Facing the Fire

This brief chapter sets the tone by revealing the earliest intimation of Scharmer’s work. He describes the day when he was sent home from school to find the family farmhouse burning down, and how he stood watching everything he was identified with disappear. He then describes his experience of realizing that this burning away of his old identity allowed him to be present in a way previously unknown, that he was drawn out of his body and into being the “seer,” the true Self. He then relates this to a realization of two selves, which he frames as one being connected to the past, and the other as “who I could become in the future” (p. 25).

Chapter 2: The Journey to "U"

Much of this book describes the journey Scharmer has taken in coming to his understanding of how we can access and enact the future that wants to emerge through us. It begins with Bill O'Brian's comment quoted above about the interior condition of the intervener. Scharmer calls this the blind spot of how we have approached change. He describes levels of subtlety at which change takes place as going from re-acting to re-structuring to re-designing to re-framing to re-generating. This last one he calls presencing, or "seeing from our deepest source" (p. 29).

Scharmer then describes his encounter with economist Brian Arthur and his description of two levels of thinking, a kind of reflex downloading and a deeper kind of knowing. Arthur's process is described as lots of waiting and reflecting, or "observe, observe, observe, retreat and reflect, then act in an instant" (p. 34). This is then related to Francisco Varela and the core process of how one becomes aware, leading to the "three gestures of becoming aware. They are: suspension, redirection, letting-go" (p. 35). These then become the journey down the left hand side of the U. Going up the right hand side of the U is characterized as letting come, enacting and embodying. This creates a total of seven cognitive spaces: downloading, seeing, sensing, presencing, crystallizing, prototyping, performing/embodying. From this Scharmer calls for "a new type of social technology that is based on three instruments that each of us already has—an *open mind*, [IQ] and *open heart*, [EQ] and an *open will* [SQ]—and to cultivate these capacities not only on an individual but also on a collective level" (p. 40). The essence of presencing is described as our two selves (past and future) talking to each other.

This model of moving consciousness, collective or individual, is further shown to be marked by three gate keeping processes that go on in our minds. These are described as the three enemies of the journey down the U; the voice of judgment (VOJ), the voice of cynicism (VOC), and the voice of fear (VOF). Each of these can abort the process of deepening the field structure of attention. Scharmer says that all of these situations drive us to the need for examining our blind spot, or the source of our attention.

Chapter 3: Fourfold Learning and Change

This chapter focuses on a discussion of how the unintended consequences of our actions frustrate us. Four levels of change are described:

- *Reacting* or manifest action.
- *Redesigning*, or process and structure.
- *Reframing* or thinking.
- *Presencing* or the sources of intention and creativity.

How prior organizational learning efforts were based on single and double loop learning is shown to be limited by only being based on learning from the past. This is in contrast to presencing, (the combination of presence and sensing) which is about learning from the future that wants to emerge. As a step in this direction, systems thinking is shown as being able "to help people close the feedback loop between the enactment of systems on a behavioral level and its invisible source of awareness and thought" (p. 55). This is highlighted in Scharmer's interview with Peter Senge and his reference to Master Nan and the core issue facing the world of "*the reintegration of matter and mind*" (p. 54).

Chapter 4: Organizational Complexity

This chapter examines three types of complexity: dynamic, social and emerging. Dynamic complexity appears as systemic types of framing that systems theory addresses. Social complexity appears as a postmodern recognition that stakeholders have different views/perspectives. Emerging complexity is about disruptive patterns of innovation and change. Scharmer describes the movement of attention from products to processes and then finally to the sources of processes/products, and provides good examples of this movement. One example involved how people from Ford and Toyota both looked at an old Ford plant and saw very different things, and how this allowed Toyota to innovate in ways that gave them huge advantages. This different type of seeing was perceived to have arisen through the application of systems thinking. This led to a call for cross institutional places for productive conversations among relevant stakeholders.

Chapter 5: Shifts in Society

This chapter looks at three major shifts in society; the rise of a global economy (as distinct from a world economy), the rise of a network society, and the rise of a cultural-spiritual shift. The first of these shifts tends to reflect a socialist view of the need for economic equality as a right of sorts. Otto tells a story that reveals how his participation in an anti-nuclear protest shaped his journey in this work. During the protest police attacked protesters, and his group non-violently resisted, with the police gradually relenting. This event is shown to have significantly influenced his drive to work on changing “that system” that has dominated the global economy.

In discussing the networked society, he shows the changes in social capital from traditional forms of social relations typified by Putnam’s book *Bowling Alone* to NGO type social networks working quietly to change the system. He then describes the cultural-spiritual shift, defining spirituality “as the source of our creativity. It is distinct from religion, for it concerns experience and not belief systems” (p. 90). He also focuses on working across ecological, social and political streams of experience and institutional structures in an integrated manner.

Scharmer then goes into a deeper analysis of the structures or arenas of experience historically, identifying objectivity, inter-subjectivity and trans-subjectivity as arenas of clashing forces related to each of the three above domains. This produces a nine square grid, where he feels that each square needs to be taken into account. He identifies the most significant clash as being in the spiritual domain, between self and Self. In his framework this means who we have been and who we can become, our highest future possibilities. He mentions Ken Wilber and AQAL theory as the most comprehensive meta-framework developed to date to comprehensively address all of these domains.

He also uses the notion of the blind spot to highlight what he perceives as the issues not being addressed by any given approach, and calls for knowledge that enables the creation of the realities we talk about. He then says this requires us to “trust our own senses, experiences and insights – without having a clue as to where that journey will lead next” (p. 104).

Chapter 6: Philosophical Grounding

A pause is taken here to recount the journey so far, and pay attention to the epistemological and ontological roots of the inquiry. Husserl and Heidegger are mentioned as setting the stage for deepening our collective inquiry in the 21st century. Scharmer lays out a matrix showing the movement of systems thinking from liner to non-linear and on to self-transcending systems as a source point, and on the other axis the movement from explicit to tacit knowledge to "self-transcending primary knowledge" that is not yet embodied. The first four cells of this matrix have been developed and explored, but there is grey area in the domains of the third movement along each axis. He cites David Hawkins as he lays out the territory that this kind of knowledge is about love as being global and rising about the separation that we normally experience.

Chapter 7: On the Threshold

Scharmer then looks at thresholds in a way that describes the process of developmental shifts very clearly. In many ways this process follows Robert Kegan's description of the developmental transitions. The movement across the threshold involves a kind of dying, a letting go of the old identity. He sees the key discipline of our time as being the capacity to attend to cracks that open up in our reality and to go and flow with them.

Part II: Entering the U Field

After presenting his rationale for why we need to look into our blind spots in Part I, Part II of the book goes into depth describing the processes and stages of the U process. The introduction given in Part I to this model laid out the basic territory, and now Scharmer proposes to take us on a deep journey into the "way we pay attention, the *field structure of our attention*" (p.117).

Chapter 8: Downloading

Here Scharmer introduces us to downloading by telling a story of a company that enacted old patterns of behavior used by the first and then subsequent three CEO's, showing how they set the tone and culture of the organization. He points to four failures of attention that this story illustrates about downloading (recalling the language of the field structure of our attention).

1. Not recognizing what you see (decoupling perception and thought).
2. Not saying what you think (decoupling thinking and talking).
3. Not doing what you say (decoupling talking and "walking").
4. Not seeing what you do (decoupling perception and action).

These four are shown to be barriers to learning and change within organizations. Reversing them leads to crossing the first threshold and entering into the second space of the U process, seeing.

Chapter 9: Seeing

The first shift occurs in moving from downloading, the result of this denial or decoupling, to seeing. In this process the field structure of our attention moves from being encased in the center of things to seeing from the periphery or boundary. Here we can see the data in front of us instead of only perceiving the downloaded images of the past. An attitude of wonder is highlighted as essential to keeping the capacity for seeing open.

Scharmer borrows from organizational learning and change literature by reframing Bohm and Isaac's notion of dialogue from being the 'art of thinking together' to the art of *seeing together*. He then uses a story that recurs throughout the book of a patient-physician forum in Germany that shows how this quality of seeing was present when people moved from an outcomes downloading approach that left the room deadened, to one of looking into first person experience and focusing attention on what was present in the room at that moment. This then moves into chapter 10 and the notion of "sensing."

Chapter 10: Sensing

The story of the patient-physician health care group experience continues in chapter 10 as the group clearly sees its assessment that the system they are working in and using operates at the mechanical/downloading levels, and that their desired notions of health care are much more holistic. Then the mayor, a teacher and a farmer all point to the same issues being present for their communities of practice. Scharmer uses this to describe the field structure of attention in sensing as allowing perception to move from individual heads to coming from not just the periphery of, but outside of organizational boundaries. The process of moving into this stage of the U involves:

1. Charging the container.
2. Deep diving.
3. Redirecting attention.
4. Opening the heart.

The story of Parsifal and Scharmer's meeting with the Circle of Seven (seven women who had formed a group for supporting their deep process work) then illustrates this process of opening to the wisdom of the heart. This leads into the work of Henry Bortoff and a distinction between counterfeit and authentic wholeness. Counterfeit wholeness is seen as attention within the mental constructs, while authentic wholeness is about sensing from within the field, having a perception from wholeness. This is linked to the story of Plato's cave, redirecting of our attention away from the mental shadows on the wall and around to the sources of those shadows and beyond to the reality outside.

Chapter 11: Presencing

This chapter on presencing goes deeply into the core of the Scharmer's work and the U theory. Presencing is described as a combination of sensing and presence. It is "a moment when we approach our self *from the emerging future*. . . . The key difference is that sensing shifts the place of perception to the current whole while presencing shifts the place of perception to the *source* of an emerging future—to a future possibility that is seeking to emerge" (p. 163).

This stage of the U journey is characterized by two core questions at the heart of creativity. Scharmer discusses his interview with Michael Ray as having best articulated these questions as who is my Self and what is my Work? The capital S self is one's highest/authentic self, and the capital W work is not our career but our purpose for being here on earth.

Scharmer talks about the field structure of presencing by telling of his pursuit of the source of the Inn River in the Swiss Alps. There he found no single source, but a host of glaciers all contributing to a small lake, and realized the distributed nature of source being everywhere. In this way the field structure of our attention is not only outside of our normal horizons, but surrounds it as a sphere would.

He then goes into Eleanor Rosch's distinction between conventional analytical knowledge and "primary knowing" or wisdom awareness. This knowing is characterized as being open and has unconditional value. He goes on to tell how she described a very Eastern spiritual view of the source of this knowing and how it can act in the world. "That knowing capacity actually is the field knowing itself, in a sense, or this larger context knowing itself" (pp. 168-9). This is followed by examples of a sculptor whose hands know what to do, a businessman falling apart to break through, and a participant in a workshop for an organization breaking through a membrane to get at a vividly living question that transformed the project. He also continues with the patient-physician dialogue story, as well as another group project.

The Circle of Seven then describe what they call the presence of the circle being, which arises when someone in the group steps over a boundary and lets go of their normal way of being in the world. This leads to the identification of three conditions of deep listening: unconditional witnessing, unconditional impersonal love, and seeing the essential self. The presence of this circle being is described in terms of time slowing down, ears ringing, not speaking casually and a palpable shift in energy. Otto then gets to experience this as they ask if he would like his work held in this circle.

Scharmer lists principles of presencing as;

- letting go and surrendering,
- inversion or going through the eye of the needle,
- the coming into being of a higher (authentic) presence and self, and
- the power of place: creating a holding space of deep listening.

Otto's experience with the Circle of Seven brought an authentic quality to his description of the presencing phenomenon. While his interviews and research with leading scientists bring great knowledge and a learning journey of great depths, and his experiences of facilitating experiences for others illustrates the principles very well, it is this disclosure of his own experience of being held and seen in the way he is describing that conveys to the reader an energetic quality behind the theory and stories, infusing them with a more authentic and vibrant feeling.

Chapter 12 Crystallizing

Here we begin moving up the U, and learn the steps seen as critical to moving into the world from this deeper place of presencing. It is the work of keeping the connection to higher Self that is made at the bottom of the U that the next chapters focus on. The stories used in previous chapters continue to illustrate this stage of the U process, and this helps to give the reader a fuller sense of the richness of each story.

The early intuitions that arise about what wants to emerge from the future, or from our highest possible future, then require some clarification and grounding in forms that we can act on. Crystallizing “facilitates the surfacing of a living imagination of the future whole” (p. 195). We can create visions from anywhere, even downloading, but harkening back to O’Brien and how the interior condition of the intervener determines the success of the intervention, creating a vision and intention from the highest self is clearly a very different thing.

Crystallizing uses principles of the power of intention, and here Scharmer uses another personal story of creating a global peace university with five student colleagues after being inspired by the pioneering Norwegian peace researcher Johan Galtung. The next principle involved is letting come, involving the question of “how can you tune in to that intention?” (p. 199). The issue is letting go of the old ways of thinking and perceiving to make space for something new to come and the capacity to listen to the new deeply. Scharmer then describes the principle of operating from “grand will” and quotes Martin Buber to illustrate the surrender that is required to let go of the ego or small self’s habitual action of inserting itself and its images into our will. Finally he talks about venues for waking up, or environments/contexts that facilitate sustaining the attention in this consciousness.

Chapter 13: Prototyping

Using the concept of prototyping from the design industry, Scharmer shows how we can help to maintain this consciousness of the higher Self by utilizing the wisdom of our hands/bodies to act in ways that our heads can only catch onto later. He talks about the tension between and care to navigate between “two major dangers and pitfalls: mindless action and action-less minds” (p. 205).

The principles involved here begin with connecting to the inspiration, maintaining our connection to the source at the bottom of the U. This requires daily practice at making and keeping that connection. He has Joseph Jaworski describe how he stays connected through daily practice, then holds that deeper intention as much of the time and as long as possible, finally noticing and seizing opportunities when they arise.

The second principle is being in dialogue with the universe. This is working with synchronicity, trusting that the universe is a friendly place and that it will help you find and refine opportunities in alignment with your higher self. Then prototyping is connected to failing early and leaning quickly by putting things together and out for feedback before they are finished and polished.

The final principle is creating strategic microcosms, or landing strips for emerging future possibilities. This means doing things under the radar, or incubating them out of the glare of the kind of attention that can crush such projects by unnecessary criticism while the seeds are still tender and new.

Chapter 14: Performing

In order to carry the field of presencing into this stage of enacting in the world, Scharmer talks about how we need to stay connected with the macro level while acting personally. Attention moves to the larger kinds of institutional ecologies that our work is embedded in. The field unfolds in a more integrated way with the center flowing out to the periphery as an integrated whole rather than a crossing of boundaries. The principles involved in this include systemic integration, innovative ecosystems, and field shift of the evolving ecosystem. He then lists eight observations that he has noticed over time that support this kind of work; core group composition, primacy of praxis, practice fields and tools, parallel learning structures, purpose and shared principles, passion or personal embodiment of purpose, perception-driven participation and finally products.

This completes the in-depth tour of the U process, and paves the way for examining how it can address the issues outlined in Part I.

Part III: Presencing: A Social Technology for Leading Profound Innovation and Change

Here Scharmer lays out the rationale for this work, reiterating the importance of moving beyond examining what we do and how we do it to the inner source from which we operate, or our blind spot. His proposition boils down to being able to distinguish that any action we take can emerge from one of four sources or fields of attention; "from the center (I-in-me), from the periphery (I-in-it), from beyond one's periphery (I-in-you), and from permeating all of one's open boundaries (I-in-now)" (p. 228). How we learn to navigate these fields is seen as depending upon learning a new grammar in order to be able to make appropriate distinctions on our journey.

Chapter 15: The Grammar of the Social Field.

Scharmer has 21 propositions that outline what he calls the grammar of the social field. He is explicit in building on the early work of Kurt Lewin in describing social systems as fields. These propositions are in effect laying out a way to make distinctions about the U process his research has revealed, and are the core tools for learning how to direct the field structure of attention. They cover much of what has gone before, and package it in a concise manner. However this is not a cursory outline of highlights. Each of the 21 propositions is explored in sufficient depth to get a good feel for what is involved in actualizing it. This lengthy chapter is also full of diagrams that build on previous diagrams to illustrate how various propositions reveal the implications of the U process. Many matrixes are the result, showing how this pattern of movement shows up in a comprehensive array of human experience and endeavor.

This mapping also includes the opposite movement that is not only possible, but in many ways dominant. The differences between presencing and its U cycle of activity are compared to the cycle of absensing, which results in not seeing, de-sensing and absensing/hubris, followed by self-deluding and aborting and destroying, and how this shows the archetypical pattern of the anti-cycle. That we as humans live in the tension between these is pointed at, but not so clearly illustrated is how these tensions may hold us in the center, not moving too much through either cycle.

Chapter 16: Individual Actions

In this chapter Scharmer focuses on choices we make as individuals, leading to mapping out the "anti-space" of the U, which depicts the processes and outcomes that arise when we move in the other direction and allow the seeds of downloading or reenacting the past to drive out attention and actions. The anti stages are *blinding* leading to not seeing, *entrenching* leading to de-sensing, and *holding on* leading to absensing/hubris. From this place begins the processes of *manipulating*, *self-deluding*, *abusing*, *aborting*, and *annihilating* all leading to destruction. In this cycle open mind becomes stuck in one truth/view, open heart becomes stuck in one world/ us versus them, and open will becomes stuck in one self/will. He calls this the space of social anti-emergence, or the shadow space of absensing. He describes how we can flip quickly between these two spaces, and points to staying awake as the way to stay connected to the source, or our highest Self.

Chapter 17: Conversational Fields

In this chapter, Scharmer lays out his work around how conversations can move through different fields. This incorporates and extends the work done by Bill Isaacs on dialogue, which itself helped to bring the original impetus that David Bohm brought to the field. This is summarized by using the matrix of the four fields used throughout the book to describe how conversations can evolve.

- The first field of downloading is enacted by speaking from what others are perceived to want to hear. This brings about the kinds of polite routines and empty phrases that we know so well. Central to this is not saying what you think, creating an *autistic* system.
- Then the second field of debate emerges when people begin to speak their minds, and is characterized by "talking tough." People speak from what they think, and are embedded in and identified with their point of view. The system here is *adaptive*, and people say what they think.
- The third field, or dialogue emerges when reflective inquiry begins and when conversation arises as speaking from seeing one's self as part of the whole. Instead of defending the viewpoint that was identified with at the previous stage, participants are able to inquire into other viewpoints. A *self-reflective* system emerges, with the capacity to see and reflect on one's own part in the creation and maintenance of the system.
- Finally, in the fourth field, presencing occurs and is characterized by a generative flow. Speaking arises from what is moving through the field, which has qualities of stillness, collective creativity and flow. It becomes a *generative* system with an identity shift to the authentic self.

Scharmer then maps these four fields of conversation onto the figure showing the anti-space of absensing. Here the movement begins with the same kind of downloading or talking nice of habitual conversation. Moving in the opposite direction, it goes through silencing the views of others through blaming others to absensing and hubris. From there it moves through intrigue and disinformation, and harassing and bullying, resulting in collective collapse. He describes the result as "conversations that pollute, poison and pathologize our collective thought (through intrigue and disinformation), that poison microcosms of emerging futures (through harassing, bullying, stifling innovation), and that eventually destroy the structural collective ground itself (collective collapse)" (p. 287).

The dynamics between the U space and the anti-space are seen as dialectical and non-linear, being able to flip back and forth instantly. He brings up the question of how can one awaken and train a capacity to perceive the threshold between the two, which is seen to exist at a very subtle level. He describes "this eyelike entity, from which sparks of our attention and intention originate, is what I call the *I-in-now*. It's the invisible origin of your real presence and power" (p. 295). Examining how the different places of origin open up spaces for different levels of conversational possibility, he charts the precursors of each of the four conversational fields, showing how the movement to each level or field is dependent on the origins of the communication; whether they are originating from downloading, factual connections, personal connections, or source connections.

Scharmer notes that most individuals do not aspire to enact the anti-space, but to live from the deeper levels of conversation, and asks why it is that our institutions seem to be stuck in the grip of pathological patterns of conversation and action. He maintains that this is from our lack of ability and capacity to direct attention to the sources of our conversation, especially the deepest source or our highest Self. He identifies the key to developing this capacity: “That journey is about deepening our attention *first* before we start to act on an impulse” (p. 299).

Chapter 18: Organizational Actions

This chapter applies the same structure to examining the evolution or devolution of organizations.

- Level 1 organizational structures are characterized by centralization and machine bureaucracies. The source of power is the hierarchical structure and complying with central rules. They are center driven and have a logic of economies of scale around production.
- Level 2 organizational structures are characterized by decentralization and work through divisions. Their source of power is market success so they operate by meeting market demand and are thus periphery driven. The operating logic switches to economies of scope related to customers.
- Level 3 organizations are networked, and have relational or matrix structures. The source of power is networked relationships, and thus they are relationally driven. They operate on a logic of economies of innovation, focused on product innovation.
- Level 4 organizations are seen as ecosystems of innovation, whose sources of power are the field of emerging possibilities. These organizations shape innovation ecosystems which are driven by this emerging field. The logic is economies of presencing and system innovation.

Stories of DEC and Enron help to illustrate how organizations have fallen due to either not moving to deeper levels (DEC) or from falling prey to the operations of the anti-space (Enron). This anti-space begins in the same place, or in centralization of the organizational structure, but the movement is characterized by institutional ignorance, arrogance and hubris leading to disinformation, sclerosis and collapse. Each of these is illustrated though following the collapse of Enron and of the socialist system in Eastern Germany.

He closes the chapter by pointing to the deeper aspects behind the development of the different levels of organizational structures, showing how functional processes and centralized structure, core processes, stakeholder conversation process and ecosystem innovation processes are the sources of the four levels of organizational structures.

Chapter 19: Global Actions

This chapter brings the focus of the U theory to the domain of global development issues and the core structures underlying them. The example of health care opens the discussion by showing how little attention is placed on support for changes in lifestyle that have clearly been shown to have a strong impact on the highest cost (in terms of dollars and quality of life) health issues. Scharmer identifies three areas of activity at this level, business, politics and civil society.

- Communication between these sectors at the downloading level takes the form of things like commercials, propaganda and bribery, soft money and lobbying. The inequities in the current structures of society are shown to work with these forms of communication to reinforce the dysfunctional operation of systems in our world today.
- At level two, the realm of debate, we get consumption as the beginning of two way communication between business and civil society, elections as communication between politics and civil society, and regulations between politics and business.
- Level three communications, dialogue, shows up between business and civil society as stakeholder dialogue, between politics and civil society as referenda, and between politics and business as public conversations.
- The fourth level sits in the center as collective presence and co-creation that operate across all of these boundaries.

The examination of the field structure of attention in this domain has:

- Level one centralized structures of government systems with emerging private sectors. The source of power is in the court and state and the coordination mechanism is center driven planning. The driving force is the politics of the court.
- Level two is characterized as decentralized with market competition and an emerging private sector. The source of power is capital and business, coordinated by a periphery driven market. The driving force is then the demands of this market.
- Level three is characterized as networked, with negotiation and dialogue with an emerging civil sector. The sources of power are public opinion and NGOs. They are coordinated by dialogue and are relational driven. The driving force behind this level is a values based civil sector.
- Level four is characterized as ecosystem presence, with emerging cross-sector action. The source of power here is the presence of the emerging whole and presencing is the coordinating mechanism coming from the emerging field. The driving force is cross-sector awareness and action.

The U and its anti-space are described as beginning from the public sector in terms of the state and government hierarchy, and with the suspension of state-centric power the private sector emerges with its capital, business and markets. The redirection of market-centric power leads to the rise of the civic sector and the focus on people, NGOs and dialogue. The letting go of system-centric power allows for the emergence of ecosystems of innovation and collective cross-sector creativity. Going up the left side of the U, letting come brings communities of cross-system co-creation. Enacting these leads to strategic microcosms of the future, and embodying these brings about deep direct democracy.

The anti-space is described as the public sector being stuck in or blinded by one power mechanism. This leads to a special interest state and lack of competition. The entrenching of this leads to being stuck in one world or logic, producing structural violence and a lack of dialogue. This is furthered by being stuck in one self, and a holding on that brings us to a collective absensing and disconnect to the emerging whole, or being stuck in the old self.

From there, the downhill ride continues with manipulating and public disinformation and anomie. The abusing of this brings about societal sclerosis and an inability to redirect attention which brings about annihilating and the destruction of democratic foundations and social cohesion.

Scharmer then outlines a way that can be used to support the transformation of capitalism and democracy through the leverage point of infrastructure innovations. He outlines innovations in democratic, market, cultural and power place infrastructures. His analysis also leads to identifying a lack of leadership "capacity to collectively sense, shape, and create our future" (p.352). This leadership must have the capacity to address the four meta-processes of the social field covered here, those of thinking, languaging, structuring and evolving.

Chapter 20: Catching Social Reality Construction in Flight

As we approach the end of this journey through the social fields, Scharmer takes us to the next level of reviewing and integrating all that has been covered at a meta-process level. He describes how the core capacity of being able to notice differences between the field structures of attention can allow us to alter their structure and direction. The place from which we can overcome our blind spot is described as the *I-in-now*.

He invites us to conduct a thought experiment by thinking of these social field structures as living entities, and to envision our jobs as being to help them become aware of themselves and evolve to the next level. He then proceeds to review the journey thus far that has taken us through multiple domains of inquiry and see what meta-patterns and processes are at the heart of the whole.

- Field one is characterized as being made up of *autistic* systems. This is from seeing that nothing new gets into systems that operate by downloading or any other level one quality. Responses to the environment are limited to automatic reflexes, habits and routines from the past.
- Field two is characterized as being composed of *adaptive* systems. There is now an opening to data from the environment and other level two characteristics across the domains encountered. One good example of how integral or meta-systemic Scharmer's Theory U is emerges when he discusses how the work of living systems describes this field of activity through the mechanism of structural coupling. The view that social systems are auto-poetic entities is popular in this approach, and a powerful framework for understanding living systems. Applying the U theory framework to the domains covered by structural coupling, Scharmer identifies the truth that this perspective brings as well as the limitations of the approach in that it does not recognize the other three levels or fields in how it views the world.
- Field three is characterized as being composed of *self-reflective* systems. He notes that the simple test to see if you are in field three is if you begin to see yourself as part of the system. In this way the system is able to see itself, and thus is self-reflective. When the capacity to operate from this system is present, environmental stimuli can trigger responses or reacting (level 1), adapting (level 2), or self-reflecting (level 3). Thus the range of choices available expands significantly, and the potential outcomes along with the different sources that can be chosen. Another feature of this field is that instead of boundaries being closed as in level 1, or when

entities influence one another across boundaries in level 2, boundaries begin to open and even partially collapse in level 3.

- The shift to field four has yet another fundamentally different quality of being *generative*, that Scharmer characterizes as moving from being connected to the current reality to “connecting with the deepest presence and source of the best possible future possibility that is seeking to emerge” (p. 361). One can now notice that “*I attend* [this way], *therefore it emerges* [that way]” (p. 361). The shift to this field is also characterized by a collapse of the boundaries between systems, and a sense of wholeness becomes much clearer.

He then presents a summary of the grammar of the social field that outlines all seven stages of the U process (downloading, seeing, sensing, presencing, crystallizing, prototyping and performing) in ten categories (gestures of paying attention, place of operating, seeing the world as, knowledge, social space, social time, collective social body (complexity) as, primary causal mechanism, episteme and self). The last three categories are then examined more closely (the others having already been covered). Different types of causal relations are categorized according to the four fields or levels and Aristotle’s four types of causation (material, efficient, formal and final). How we epistemologically move through the U is explored briefly, and a section looking at how the self is experienced is explored. This section is of relevance for those familiar with developmental models, as Scharmer demonstrates how the stages (sliced and named somewhat differently by different researcher’s foci) describe a universal human condition. He is clear that this aspect is “the most fundamental grounding condition” (p.375). The movement of the self “progresses through stages and states that shift from emphasizing the subjective, objective, intersubjective and trans-intersubjective” (p. 375) realms.

Chapter 21: Principles and Practices of Presencing for Leading Profound Innovation and Change.

In this final chapter (other than the epilogue) Scharmer moves from the theoretical and technical discussion of Theory U to providing readers with a “how to” approach, the practitioners view. This involves 24 points, complete with examples and practices for each. This provides the reader with a shift in perspective, allowing the theory to come alive in a new way that is more active. Passing over the same territory with another iteration taken from a different slant enables a kind of triangulation for the reader. It helps to emphasize that the theory has resulted from practice and experience as much as reflection.

Suggestions for how to engage others in this process, how to apply it in various contexts and situations, and how to prepare one’s self in the navigating the various transitions all round out the picture in a rich and engaging manner. It also demonstrates that this is not just a theory, that Scharmer has practiced what he preaches.

Epilogue

The closing few pages of the book tells more of Scharmer’s story, activities and aspirations for his work. He is very candid about his hopes and dreams, and the unknowing and trust in the emergence of the open will or surrender to the higher Self and its capacity to act for the greater good. There is much to be inspired by, as his enthusiasm flows through and between the lines. A kind of transparency of self is present, and you can *feel* your way into the space he creates through his stories. The epilogue is in a sense a call to action, an invitation, although not explicit. How readers choose to respond to this call will be the next phase of the story.

Critiques and Reflections

I will now offer some critiques and reflections on Scharmer's book. Beyond my general interest in the field of leadership, I have focused on the intersection between understandings of higher state and stage structures of consciousness and leadership in particular. This area of research overlaps with the territory that Scharmer covers in his book, in particular the aspect of deepening consciousness and leadership's relationship to the capital S higher Self.

I begin with a response of gratitude for Scharmer having taken the time and effort to distill what is clearly a life's journey into a clear, coherent and well organized volume. Scharmer presents his material in an accessible manner by taking an initial overview and then unpacking it through multiple iterations. These iterations cover what is revealed near the end to be the meta-process underlying all of the various iterations. There is also a deep underlying coherence in how the work hangs together. An example is the way in which the figures (which do a great job of illustrating the text) are able to repeat and add in different aspects of the process to show how this meta-process manifests in various forms.

From this stance I will now examine a few ideas presented in the book that could benefit from some further elucidation or development. The first thing that drew my attention was that it seems that the further up the right side of the U Scharmer goes in his description, the thinner the details and descriptions of how we can actually embody and engage the consciousness of presencing are at these later stages. This may be because there is simply less to say about it – the preceding groundwork makes it evident where the leverage points are, in getting to the bottom of the U. If we don't get there, we don't get the full benefits on the upward side anyway. Or it could be that there is less known about how to operationalize it in the world. Either way, the emphasis is clearly placed on the left side descent to the bottom of the U.

Chapter 15 on *The Grammar of the Social Field* contains Scharmer's 21 propositions for understanding social change. These offer a summary of Scharmer's view and understandings in one concise area, and I will frame my comments around selected points.

Identity and Creative Being

In point six, I perceived a potential blind spot related to notions of identity. By talking about the move from level three to level four, Scharmer says that an open will "requires *letting go* of old identities and intentions and letting come new identities and intentions that are more directly connected with one's deepest sources of individual and collective action and energy" (p. 242). This description is reminiscent of Robert Kegan's discussions of transformations between levels of consciousness, and I think would fit quite nicely within this framing of the process of how identity shifts with development.

However, Scharmer has in places drawn on David Bohm's work, and I find that there is a subtle distinction that Bohm offers that is relevant to how this point is framed. While I agree with the letting go of old identities, this misses Bohm's point in his inquiry into the concept of thought as a system, that the most essential blockage or incoherence occurs from the process of identification itself, and that a more *creative* sense of being is more appropriate. I think that this is one area in Scharmer's work where some further exploration of what is going on at this deeper level could help to clarify the depth of demands that this stage is making.

At point 16, Scharmer does address the issue of identity at the bottom of the U in another way that aligns more with Bohm's sense of a creative notion of being. "Here the self functions from its open boundaries and its surrounding sphere as a generative vessel through which a new collective reality is coming into being. There the self is no longer locked into the center, rather, it co-evolves by participating in the coming into being of a new social collective" (p. 254). This also comes up in point 14 where Scharmer recounts an incident related to this. "When I returned that evening, I was no longer the same person (implying that somewhere along the way I must have had an encounter of connection with my emerging self)" (p. 251). This very interesting quote reveals something about the relationship between an identified sense of self and the "emerging self" or "highest potential future self" which has a more creative than identified focus. On the next page this comes through as well; "to an authentic self that is identical to our highest future possibility and that comes into being through the open boundaries of the human body field, both individually and collectively" (p. 252).

These points reveal to me some of the complexities and challenges involved in attempting to convey the subtleties of conceptions of the self that are outside of the normal conceptual constructs of general public discourse. While the notion of changing identities is covered in point six in a way that is easy to understand, the more fluid and creative, process oriented descriptions of being in points 14 and 16 could benefit for further clarification, and I believe that Bohm's notion of a creative notion of being would make a good a good ground for this. Later in this review, I offer further considerations on this point and what I perceive as implications for Scharmer's work.

Developmental Issues

In point nine, Scharmer talks about an open heart as the "capacity for empathic listening, for appreciative inquiry, and for 'exchanging places' with another person or system" (p. 244). While this is indeed a valuable quality, what are not discussed here are the prerequisites for doing this. One may have an open heart in many ways, but there are specific action-logic stages at which the capacity to actually take another person's perspective emerges and goes through degrees of growth. While many adults have a rudimentary level of this capacity, it also seems apparent that many people do not have some of the more complex degrees of this capacity. For instance, Bohm points to the reflex defenses of the system of thought that can hide self-deception. Noticing, illuminating and suspending such reflexes of thought entail a capacity to notice complex internal processes that are relatively rare in society today.

What then is the implication of this? Is this another case of the implicit curriculum making demands that place people "in over their heads?" Can this lead to presencing and the U theory being limited to an elite spectrum of the population such as the so-called "cultural creatives?" Scharmer addresses this in one way in chapter 20, where he talks about how "the collective serves as a gateway to access the deeper states of awareness and knowing" (p. 375). I have also discussed this with others as how a facilitator can use their own access to higher states of consciousness and action-logics to create a space or container where people can "draft" into it and engage deeper levels than they might on their own. However these issues sort themselves out, I think that there is further work to be done here to clarify and strengthen how the U process deals with these issues.

One area in which this is discussed to some degree is in chapter 17 on conversational actions. Here I think that it would further strengthen readers' ability to apply the U process by having a discussion on the relationship between the process of dialogue (as one involving participants moving through the four stages outlined) and the capacities required in terms of action-logics. Key issues could be framed in terms of a distinction between *structural* stages (relating to relevant action-logics as centers of gravity) and *state* stages (relating to this aspect of the field of attention).

Another approach could be to examine in more detail the relative impact of the structural stage capacities present in individuals within a group on how well a structured process can facilitate people moving into these higher state experiences of reflective or generative dialogue. What level of higher order cognitive capacities are necessary, or how much can this process act as a holding space for structuring state experiences? How much of any of this is dependent upon or facilitated by the level of cognition and or state experience and presence of a facilitator?

It is these kinds of questions that arise from reading through this section of the text. As this happens, my attention is drawn to inquire into what other areas of the work are also dependent upon higher action-logics. At the same time, I also reflect on how other aspects of our being in the world may be able to influence or open up space for this kind of work in ways that can transcend developmental limitations. This is an ongoing area of research fueled by conversations with colleagues and personal experience.

A Blind Spot?

I think that for me to engage the U theory and process at its deepest level, it might be helpful if I were to make some of the underpinnings of my view explicit first, to allow you to take into account my biases going into this. I will use a story to illustrate the essence of my view. I have a Jesuit friend with whom I have had an ongoing conversation about the nature of the relationship between human persons and soul. What I hear from his theological perspective is that we humans have a soul, (kind of like we have a liver or a right foot). The underlying connotation is that we *are* this physical body and that any idea of a soul must be some kind of appendage, situating itself in relation to the body. I would argue that this didn't make sense to me. I said that from my view, humans as physical bodies are transient and temporal (we live and die in time) while soul is eternal and various other qualities of a transcendent nature. How could the transcendent end up as an appendage of the transient? It made much more sense to me that we *are* soul, and that the relationship between soul and being human was that soul was having human experiences.

This view is seldom relevant in most of the conversations that I have, but in this case I found myself noticing how it could be relevant to a number of issues that arose for me in Scharmer's text. I use the term soul in a manner that I interpret Scharmer describing as our highest Self, our highest future potential, or our authentic Self. (Further framings of a more non-dual nature are also possible to use about these distinctions, but for current purposes the distinctions as laid out serve a relevant purpose). This is in contrast to the self that is constructed by habits and past experiences. The mechanical self acts in the world from a place of disconnect from the present as well as from the wholeness that is seen to be at our authentic core. The authentic Self acts as the *I-in-now* and comes from this place of wholeness. While it can be present to the current realities surrounding it, Scharmer makes a distinction about it primarily acting to bring forth what is proposed to want to emerge from the future. I highlight the similar meanings apparent in our use of different terms to emphasize what I perceive as a common aim.

From this common ground, I want to point to a tension and possible blind spot I perceive emerging from bringing together two points from the text and introducing an implication of how these are potentially impacted by a different view I will introduce. The first point from the text is O'Brian's insight that the success of any intervention depends on the *interior condition* of the intervener. The second point is how we need to deepen our attention and connection to our authentic Self *first* before we act on an impulse. The view I want to contrast arises from a reaction I noticed in myself to a number of characterizations of the state of affairs of the world, (and that I point to in my opening remarks), is that there is something fundamentally wrong or unfair about the world in its present condition. I want to contrast this with a view of the world as being *exactly as it should be*.

As I mentioned in my introduction, most people would (and will) think that you (I) must be blind or in serious denial to think other than that the world is unfair, in a mess, or headed for destruction unless we do something soon. There are a number of places, such as the introduction to Scharmer's book, where this view is put forward as a kind of assumption about the current state of the world. Later (p. 299) Scharmer lays out a similar critique (that gives the impression of a rant) of how children are raised and schooled through TV, violent video games, downloading schooling and drugs to treat attention deficit disorder, that display this underlying perception.

In contrast, what is described as emerging in the world has to do with many efforts at making this world a fairer and equitable place, eliminating poverty, distributing economic rewards more evenly and so on, and indeed there are many such efforts underway today. The reaction that arises in me reading these kind of descriptive statements is that the only acceptable response to the current state of affairs is moral outrage and activism to change things. I am reminded of a saying I once saw posted on a door to the effect that – "if you're not outraged you're either asleep or not paying attention." This sentiment is not particular to Scharmer. I find it in many places in the world. I also want to make clear that I see this particular perspective as a part of the larger view presented in the book. (I want to be clear that this does not mean that I think we shouldn't do anything to make the world a better place. I feel that one of the core purposes of our existence here is to learn how to leave things better than we found them).

This brings me to the tension I perceive arising from the application of the two points from the text to the difference in view I present. If our interior condition impacts the success of our interventions, then the view we act from is the highest leverage point we have. The need to pursue the source of our connection to the whole, or our highest future selves, as fully as possible before taking action in the world seems to me to be central to our interior condition. The view that arises for us would also seem to be connected to the route we take and how far we have gone on our journey.

The tension I perceive is between poles wherein the world is fundamentally flawed or exactly as it should be. Where one views the world from along this continuum will have a significant impact on the interior condition being applied to any intervention seeking to help make the world a better place. I would characterize the pole viewing the world as fundamentally flawed as a "social consciousness." While the social consciousness often wants to "save the world" from its fundamental flaw, the view arising from the other pole can offer a degree of non-attachment and alleviate the "should" energy of the social consciousness. I would propose that this quality of energy arising from the social consciousness pole of this continuum could impair the interior condition of the intervener and lessen the effectiveness of any interventions. There is a razor's edge here, between the desire to be of service to the world and one's fellow human beings, and the quality of energy one brings to these acts of service.

Thus what I perceive to be at issue here is a mix of views. On the one hand there is the social consciousness that is driven to save the world from the view of a flawed world. On the other hand the U process drives consciousness to deeper and deeper connections with something beyond self that in some spiritual perspectives arrives at a place of non-attachment, acceptance and compassion. This view can coincide with seeing the world as being exactly as it should be, and can make space for a different quality of energy in the interior condition of the intervener.

This brings to my mind Bohm's inquiry into the root causes of challenges in our society. His view was that it is incoherence in our thinking that continues to worsen the situation. To solve these problems we think about them, but are not necessarily using thought from our highest Self, or soul in my vernacular. Instead, we allow thinking to be in charge, allowing the social consciousness (my view of it as being a symptom of the reflexes of thought) to hold sway and continue to perpetuate conditions that maintain and justify the view that the world is fundamentally flawed and in need of rescuing.

The view I introduced of our being soul and having human experiences can shift the view and place from which we make our interventions. It is much easier from this view to let go of an existential identification with or attachment to the human body as the ultimate source of our existence, which can shift energy away from the social consciousness pole. The creative process of an unfolding sense of being can be seen as soul continually revealing and coming to know itself in the actions of being in the world – being in this world but not of it. The locus of Self is not ultimately dependent upon the condition of the world. At the same time, from a place of non-attachment, acceptance of the world as it is, and compassion for all, the interior condition of our interventions aimed to make the world a better place can have a better chance of success.

This is a potential blind spot I see in how the U theory and process is described by Scharmer. The tension between the two poles described of a spiritual and social consciousness, and the tendency prevalent in our society today to act from an interior condition charged with energy more from the social consciousness end of things could be a limiting factor in attempting to solve the very issues the approach is intended to deal with.

Epilogue

After writing this overview and reflections, I had the opportunity to discuss them with Otto Scharmer over breakfast. Our intense and stimulating conversation covered many facets of these ideas and areas for future inquiry and research. As well, in response to my description of a potential blind spot, Scharmer made a comment that I felt revealed the sense of depth of view that came through between the lines of his book. As I described the widespread consciousness of the world as fundamentally flawed and in need of rescuing, he replied that his writing reflected a phenomenological reporting of a kind on the times he had grown up in and experiences that shaped his view. This revealed to me a feeling of him being able to talk about his entire body of work on Theory U as an object of reflection, something that he could take a perspective on. While my reading of his book gave me a sense of something between the lines beyond what was being said, it was not so clear until the moment of his response to my critique. From this experience, I came away with a deeper sense of the potential that Scharmer's work with Theory U has, and at the same time how much it is a work in progress and a rich avenue for future research.

Jonathan Reams, Ph.D., *is Editor-in-Chief of* Integral Review *and currently an associate professor in the Department of Education at the Norwegian University of Science and Technology, where he teaches organizational counseling, coaching and leadership, and is pursuing research in the areas of leadership, dialogue and counseling.* Jonathan@Reams.com

Sent to Play on the Other Team

Josef San Dou

The star player on the soccer team that season was my six-year-old son, Jack. As the team's coach, I once made him play on the opposing team. I have been asked, why did you do that? And what happened when you did?

In our soccer league, the teams of the same age group often have their practices at the same time. Ours is U-6 team with players from age four to six. We usually use the last 30 minutes of field time to play a scrimmage game with another team. As unofficial games, scrimmages are another form of practice, but of course with a more serious feeling tone about them than when the team practices by itself.

This particular day, we were going to play scrimmage against a team we had beaten every time we scrimmaged that season. It also happened that this team was short of players that day, something that had never happened before. We could not have a scrimmage if one of the teams was short of players.

I explained to the boys and girls on my team that the other team needed one more player. I asked which one of them was willing to play on the other team so we could have our scrimmage. No volunteers. So I told my son Jack to go over to the other team. He didn't want to, but I pushed him to agree. He went grudgingly.

Once the game got underway, Jack played just as if he were playing on his own team, giving it his best. History was made that day: his goals won the game for the other team, its first-ever win. Afterwards, Jack got an unhappy earful from his teammates. Even his then-four-year-old sister, a first-year soccer player and spectator of the whole event, gave him a chiding look for causing his team's defeat. With all that pressure, he was very sheepish about it afterward. I just smiled to see all the commotion. Later, I pulled Jack aside and mentioned to him that he did a good job and had played really well. He seemed to feel better about it.

That other team had a lot more experience with feeling sheepish, but not about winning. With no wins in their record till that day, it was always obvious to me how discouraged its members felt before a game. It was great for them to win that scrimmage, and to have the encouragement that came with it.

And that kind of encouragement is what my coaching philosophy is all about. It explains why I chose Jack to play on the other team when no one would volunteer. The way I put a team together is based on balance of strength, and I want to have two teams with equal strength. Although that day was the only time I sent a player over to another team, I work for such balance in all our games. I don't want other teams to feel discouraged that they lose all the time. It is an attempt to shift the strength when things are out of balance. That way, all the kids from both teams can have an enjoyable and exciting game.

SOME RIGHTS RESERVED

The last official game of that season happened to be against this same team that Jack had played for. But this time, Jack played for his original team. By half time, we were up 4-0 with Jack doing most of the scoring. I held Jack back in the second half and let others play. This way, both teams had an exciting game in the second half. The game ended with a tied score. I was happy to see both teams having fun. Even though there is score-keeping, I want to keep the balance between the two objectives of having fun first and then hopefully winning the game.

The players' experiences and perspectives are not the only thing to balance: there are also the parents and the grandparents of the players. They want a good game, too. They come to root for their kids and they want them to be successful. Understandably, they don't want to see their kids cry when they fail.

For teaching soccer skills to kids aged four to six, I have only two expectations: that they learn the correct kicking techniques, and that they learn to kick the ball to the right direction. You know, sometimes they kick the ball to their own goal! It takes practice. Coaching is like gardening. You plant the seeds in the ground by teaching the kids the right kicking technique; you water it by regular repetitive practice; and then you hope they will continue to grow and produce beautiful flowers that are going to bloom some day.

Just as each kind of plant is cared for differently, the way I deal with each player is also different. I evaluate each player's strengths and weaknesses and try to empower them from there. Some players learn faster than others, but I believe each player has his or her time to bloom. This past fall season, we had a player who didn't do anything but play with the grass both during practice and during the game. Her parents were so discouraged that they wanted her to quit after our second game of the season. But with eight games to go, I encouraged them to give her a chance at least till the end of season and see how she did. So, she kept coming to practice, and in the last two games, she came around and played really well. Both she and her parents were really happy about it. Their patience paid off. I was proud of her.

Patience is another important element in teaching these kids in the early years of playing. The principle is really the same as for gardening: to patiently water the seeds and young plants so that flowers can bloom someday. In its own time, the flower will bloom.

In a way this is really my approach to life, including the way I manage at work: I identify the strengths and weaknesses of each person and assign them at the right post so things work effectively. Well, it is like any sport, say football: you cannot expect a lineman to play as a wide receiver or vice versa. But if everybody plays according to their strengths and plays in the right position, you will have a good team. I am biased of course, but I think we also have a good team in the department where I manage.

My motive for having a good team is really to have a good time. When I was growing up in Indonesia, I played soccer almost every day. Between chores we had to do, playing soccer was our main avenue to have fun. Winning or losing are just byproducts of the game. If you win, you win, and if you lose, you lose. We didn't really emphasize winning or losing. We just had fun.

In Indonesia back then, we didn't have a system like here in the U.S. Starting kids playing soccer at very young ages in an organized league is an excellent system. But the system will work only if we are patient and realistic about kids' ability and timing of development. Quite often, parents have unrealistic expectations. Understandably they want their kids' team to win. But in my opinion, this makes it hard for kids. This will be even worse if the coach has the same mentality. Let the kids grow and as the saying goes, winning is not the only thing.

The focus of the game should be enjoyment of the game itself. If you play without any pressure or expectation to win, most of the time you will win the game. When you try to play with the intent to win, more often you lose the game, and quite often it hurts more. It's better to approach the game just for the love and enjoyment of the game itself. It's like watching the flowers in your garden. Of course you want them to bloom right away, but that's not going to happen. Just enjoy the moment and in their own time, the flowers will bloom. As I say often, winning or losing are just byproducts of playing a game. It goes back to balancing the team, having the enjoyment of enjoying the game, rather than the winning of the game. That's the real win.

My son Jack has never asked to be sent over to an opposing team since that day when I forced him to. Just as in any sport team, there is a tribal energy in a team, a sense of belonging there, especially because they practice together so much. In his team's case, with Jack being the best player, I found they relied on him a lot. So it was a good opportunity for them to have to do without him that day. They got to rely on themselves and have a chance to break the habit of relying on the star to win the game. When we take the star out, we can see others develop. And that's what this soccer gardening can do really well, when we approach it with the aim of keeping the strengths and weaknesses balanced: Develop our kids so they can bloom.

Art and the Future:
An Interview with Suzi Gablik by Russ Volckmann

One day, I was interviewing a particle physicist (Basarab Nicolescu, Integral Review 4) and he called my attention to the work of an art critic. I wondered to myself if this was a case of transdisciplinarity. Well, in a way it was, at least at the level of valuing meta approaches to life. He indicated that the art critic, Suzi Gablik, had referred to transdisciplinarity and also the integral theories of Ken Wilber in her book, Has Modernism Failed? Well, I just couldn't let that drop. It was just too intriguing to see if I could find the themes that brought these two unique individuals together. I wanted to play in that sandbox, too.

First, I turned to Gablik's book, Has Modernism Failed? *Here is a summary of what I found that encouraged me to take the next steps. Her thesis is that the world of art has become competitive and exploitive and that the focus in the world of art had become profit. Not only are these limiting to artistic expression, but they ignore essential concerns of art: aesthetics and ethics.* “Aesthetic autonomy is a deeply rooted idea—autonomy implying moral and social separateness as the condition of art-making,” *she wrote. She saw the need for a unified vision of the world where art and ethics would not only coexist, but cooperate.*

Gablik found in the works of Ken Wilber the promise of integralism where diverse perspectives can be engaged to address the world as one undivided whole with the “well-being of each part is the responsibility of every part.” *Here she found a promise for an end to art dominated by economics and consumerism, an art liberated to be an essential life of individuals and of communities. She found examples of this in the world of art. Two high school teachers engaged their ceramic students in the Empty Bowls project to help a local food drive. This simple project has grown into a nonprofit organization, The Imagination/Render Group, which supports drives around the world.*

She then turned to Basarab Nicolescu's Manifesto of Transdisciplinarity, *which she sees as pointing the way to dealing with multiple levels of reality at the same time. Gablik observes,* “Also, it has a unique goal: to propel us beyond either/or thinking into a coexistence of nested truths.” *This leads to the potential for the individual artist to become an integral component of a larger social network, which she sees as a generative creative force. Seattle's ARTS UP program that pairs artists with communities around the United States has led to engage in a civic and artistic dialogue. These dialogues have led to numerous projects* “founded on the idea that art can have a vital role in community building, and in giving voice to those whose lives are otherwise unrecognized or isolate.”

Her book closes with a note of optimism in which she senses

> that significant changes in power relations are occurring as these decentralized network structures now offer the possibility for artists to interact with each other, and share information, in a democratic and cooperative atmosphere that was mostly absent within the hegemonic, competitive, institutional structures of modernism.

SOME RIGHTS RESERVED

This would lead to "a new kind of art that can help realize needed change in the world."

Now this was going somewhere interesting, I thought to myself. This sounds like a whole new perspective on growing a healthier world. The edition I read was published in 2004 (1984 was the original), so here is an opportunity to explore that perspective. After setting up a date to have the interview with Suzi Gablik, she helped me access a couple of her other books.

Conversations Before the End of Time *(1995) is a series of interviews about the themes related to the development of a relationship between art and community, art and a healthier future for the world. It includes discussions with James Hillman, Thomas Moore and many others more directly involved in the world of art.* Living the Magical Life: An Oracular Adventure *(2002) is an intimate focus on her own life at a time when she seems to be a coming to peace with her having moved to Virginia from London in 1991.*

> Everything is collage. In a sense, the parts 'give themselves.' Living the magical life means learning to recognize and connect them to the whole. We are translators and mediators in the field from which our experience arises. In this field, all is analogy, relation, revelation, by the laws of correspondence. Imagination is what opened the connection between one level and another.

She has learned that "the universe is a better organizer than you could ever think of being, so give it a chance and stay out of the way. Surrender to the world, receive it in your stillness:

> And it will happen. For miracles gravitating
> To earth, know just where people will be waiting.
> And eagerly will find the right address
> And tenant, even in a wilderness. (Joseph Brodsky)

Her account of relationships, experiences and explorations leads ultimately to this:

> Psyche's secret has finally become transparent to me: Let go of the consciousness of disappointment. Release your belief in the promise unfulfilled. Sacrifice the need to know, and trust the invisible processes that are at work. Develop a mind that can work with whatever happens. Allow everything to be all right as it is and simply remain true to the quest. When you learn to stop struggling and do nothing, everything is possible. Submit, surrender, become an embodiment of the feminine principle. Don't assume you know the right answer in advance. We are simply part of the vaster design that is unfolding.

I hope that these glimpses into the work of Suzi Gablik prepare you for this challenging interview. It is challenging, perhaps, because I have not yet learned Psyche's secret.

— ***Russ Volckmann***

Russ: *Suzi, it's a great pleasure to talk to you. I've read three of your books, and it seems as though you've been on a quest—perhaps more than one. Initially it seemed you were concerned with the commercialization of modern art, particularly in the New York art scene, and next, the relationship between art and the ecological and sociological crisis we face in the world. Then, you seem to go on to looking at the role of esthetics and ethics in art. Finally you have engaged in the discovery of the mystical in your own life. How would you amend that summary of your quests?*

Suzi: I don't know that I would amend it. I think it's nearly perfect. I definitely would say that my initial concerns with the idea of art being so commodified, and my subsequent search for alternative models of art making are still a concern to me. Since I first started writing and talking about these things, a kind of alternative parallel art scene has developed that is quite fluent and rich, but at the same time, the hard-core art world is more commodified than ever, and is still firmly entrenched in those same patterns of behavior. So in one sense things have changed, but in another, nothing much has changed.

Q: One of the things that really struck me in thinking about art in some very new ways as a result of reading your work was the idea of art as a social expression, as a political expression, and so forth. A colleague of mine called my attention to a quote from the German artist, Joseph Beuys, which states:

> Only on condition of a radical widening of definitions will it be possible for art and activities related to art [to] provide evidence that art is now the only evolutionary-revolutionary power. Only art is capable of dismantling the repressive effects of a senile social system that continues to totter along the death line, to dismantle in order to build 'a social organism as a work of art'…every human being is an artist who—from his state of freedom, the position of freedom that he experiences at first-hand—learns to determine the other positions of the total art work of the future social order.

Does this comment of his, written in l973, and the kinds of work that he did in Germany in the '80's with, for instance, the 7000 Oaks project, represent the sort of thing you are looking to have happen in the art world?

A: I would say very much so. In many ways, Beuys was possibly the first person to put forward a significant and radical idea that ultimately became a ball many of us took up and ran with: the idea of "art as social sculpture." With this small phrase, Beuys laid claim to the idea that art doesn't have to be made from specific physical materials like wood and stone, or paint and canvas, but rather you could sculpt society itself, shaping it through ideas and modeling behaviors. He made use of social processes and contexts that went beyond familiar art institutions, like museums and galleries.

Beuys is a particularly interesting figure, however, because he was like a shaman in that he could navigate freely between different worlds. Many of his art works consisted of things like projects for planting trees and he was even the founder of the Green movement in Germany. But he was also quite comfortable making art in more traditional modes, which he exhibited in the usual art world channels. They were not necessarily the most predictable kinds of objects, however—his sculptures were often made from bizarre materials like fat and felt. They were exhibited in a huge retrospective show at the Guggenheim Museum in New York. Beuys was unusual in the way he was able to straddle and bridge two worlds. Most artists tend either to follow the predictable, lockstep scenario for becoming "professional" and competitive in the art world, or they go off in a completely different direction and make their own path. Beuys was interesting because he did both.

Q: *I recently read your book,* Conversations Beyond the End of Time, *and thought it was just an extraordinary work. I don't think I've ever seen anything quite like it where over a period of about a year and a half, you had conversations with all kinds of people—artists, critics, psychiatrists, sociologists, and more—discussing these themes. You were able to create a work that shows art as a developmental path, not only an expression of the individual, but as an evolving social expression as well.*

A: My work over many years has been to articulate the vital role of artists in society, and along the way, to create a new paradigm as well. In my early years of writing art books, I was very influenced by New Age, or new paradigm thinking—that included things like systems theory and the eco-philosophies that burst forth on the scene during the 1970s. Many books were written that influenced my own approach greatly. I tried to apply these ideas to the sphere of art.

I guess I've always been trying to deconstruct the cultural narrative which pins art to careerism, self-promotion, and the creation of "art stars," and which is linked to the obvious gallery and museum nexus. I wanted to validate and expand the possibilities for art making, so that they could include many more options than that. This was not meant to negate the former, but rather to help those artists who found careerism a deadening path break out of the mold. I wanted to encourage them to feel validated if they work outside the familiar contexts.

Others have taken up the same banner, so at this point there is a whole world of post-studio practices, and of artists who see themselves not just as makers of valuable commodity objects, but who see themselves as active participants in a global world, and who are willing to make art in the service of something more positively social or environmental. Many of them set out to try to solve social and ecological problems as artists. That often entails embracing what probably interests you most in my work: a willingness to embrace a healthy confusion of genres, to cross boundaries and disciplines at will. In a way that often decentralizes the act of creativity. This stands in direct contrast to the heightened individualistic modality of "look at me and admire what I've done" that is so much a part of the art scene.

Q: *There are several themes in what you've just said that are really interesting. I'm reminded of how during the Depression, artists and architects were used to create public works, be they paintings, buildings or sculptures, to try and help bring some income to* *them, as well as make a contribution to the public. We had an example of an economic crisis that brought a very special role for art in the culture. Would that be an early example of what you're talking about, at least in the last century?*

A: Up to a point. But those public works' projects, in the context of the time in which they happened, pre-date what we can call the "paradigm shift," which refers to a change in the whole modus operandi of making art. Mural artists then were still making art in acceptably traditional ways, although they were oriented towards a different kind of public and site, and they were more socially directed in their imagery.

Q: In more contemporary terms, I've seen public programs that work primarily with at-risk youth who paint murals on public buildings; they're being guided by muralists, and that's another example of the same phenomena.

A: Yes, but there's an important difference between the two. Both produce murals, but in the more community-based art of today, there are other creative social processes going on, such as building communities for these youth, and positively altering their lives in the process, by giving them a sense of purpose, or bringing out artistic talents they didn't know they had. It offers a more healing component rather than just a purely visual experience.

Q: That's one of the streams that I think your comments brought out—that of the healing potential of art. Another one is that art can be an expression of a desire for change. It is a desire to have the world be more aligned with aesthetics and beauty, perhaps even with social justice and other humanistic criteria. Is that also a stream you were alluding to?

A: Yes, definitely. The whole idea being to open art up to a larger definition of itself, and allowing it to engage with more aspects of life and the world than is possible if you are functioning alone, behind closed doors in a studio. A lot of this sounds pretty old-hat now, but at the time that I first started writing and talking about it, these ideas were pretty blasphemous. Sometimes I'd be greeted in a lecture hall as "that woman who hates art objects." At other times, I'd get a standing ovation, so it was a very emotionally intense kind of stand to take at the time. What I was saying really challenged accepted ideas that were strongly in place and still are, for that matter, in terms of the culture. If you work with young people (which I don't do much anymore), you will find that, in any group of art students, there are always the ones who want to go the accepted cultural route. That is to say, if there are megabucks to be made, they are certainly up for it, willing to give it a shot and abide by all the rules of that game. Then there are others who are not drawn by that at all. They want to pursue a kind of art oriented towards a different vision of "success."

Q: You talk about ecology as well. In the nineties, the threat to our world was very prominent in your thinking. Is that accurate?

A: That is accurate, but it can't hold a candle to where my thinking is now. My distress at what is happening to our world is so consuming now that art has just about dropped below the radar and become almost irrelevant.

Q: So are you saying there is no role for art in trying to address the ecological challenges we face?

A: No, I wouldn't precisely say that. I still consider that an "eco-vention" by an artist—meaning, for example, the reclaiming of a contaminated landscape or restoring a polluted river, is arguably a more honorable and interesting form of engagement with the world at this time than seeking to get one's work favorably reviewed in a major art magazine. That sounds very judgmental, I know, but I'm only speaking for myself here.

Q: But with the intensity of the ecological crisis we have in the world, that's what's calling your attention, is that correct?

A: What is calling my attention right now is a book I'm reading, called *Endgame*. Its author, Derrick Jensen, puts forth a rather unforgiving and radical thesis—one which those of us who have been thinking about these things for decades already know, but haven't ever quite put in such drastic terms. Jensen claims that civilization is unredeemable; it has catastrophically degraded the planet and has given us license to destroy life on many fronts—species, plants, humans—in order to get whatever resources it needs to keep itself going and continually moving forward. Meanwhile we've vastly overreached the earth's carrying capacity, yet we continue to expand as if this were not the case. Jensen calls this a "traumatic situation," because no action we can take at this point is of any avail.

There is a second volume in which he actually encourages the dismantling and destruction of civilization—taking it out before it takes us out. I think he's right about the intransigence of the cascading crises that confront us. I don't think there is any escape from situations like the polar ice caps melting. Nothing we can do at this point is likely to reverse that, and this is just one example of an intractable situation.

There's another way that we are under total threat as a civilization and as a species and that is the virus of holy war. I've spent the last year reading about the threat of global jihad and the clash of civilizations: jihadism versus democracy. What it comes down to is a sort of lust to annihilate at any cost. For us, it's a matter of taking control of markets and devouring resources to sustain our way of life, whereas jihadists want to take over the world under the umbrella of a very sinister religious control. If we think that America is bad in the department of imperialistic agendas, I can tell you that al Qaeda is far worse, albeit for different reasons than ours.

Q: That leads to a kind of pessimistic perspective that is a little different from 1994 when you were talking with Laurie Zuckerman in your Conversations *book about the ecological crisis. You had some sense, then, of optimism about a paradigm shift. I remember one statement in which you were talking about living in a transitional time, when the values* *and way of life we've been taught to live by in our culture have come to be seen as toxic. This brought up issues of healing and transformation. You said, "It seems as if there is a spiritual and social obligation to participate in this process of healing our world, however one can." Does that mean that if things are as bleak as you've just described, that you've moved away from that?*

A: I don't know what I think at this point. I'm trying to come to terms with the unpalatable fact that despite decades of so-called "paradigm shift," little has really changed for the better. It seems instead as if things have gotten much worse. So I think I would want to frame your question differently: "If you were on a bus going down a mountainside, and you realized that the bus was careening out of control and about to go over a cliff, what would you be doing? Would you be looking out the window, or would you be hiding your eyes?"

Q: I guess I'd be looking out the window.

A: That may be our primary task at this point: to come out of denial and bear witness. To really confront the sheer deadliness of our present circumstances. It's a moot point as far as what the human race can do about all this now, since too many genies are out of the bottle and we can't put them back in. The human race has proven itself to be deeply dysfunctional. We've known for a long time that we're destroying the planet, yet we continue to do it with no let-up. Everyone knows that this war in Iraq is lethal, but we've managed to create a situation where nothing we do can solve the problem. Whatever we decide to do, the truth is we're trapped—or as Jensen prefers to put it, more grandly, "We're fucked."

Q: Back in 2004 when you published the new edition of Has Modernism Failed?, *your closing chapters indicated that you had an interest in transdisciplinarity and integral theory—in the works of Basarab Nicolescu and Ken Wilber. It seems that you saw something about the work they were doing as providing frameworks or perspectives that added value.*

A: I definitely believe that's true and I haven't changed my mind about that. Integralism is a great antidote to perceiving reality in the dualistic mode that plagues Western civilization. It calls for reciprocity and equality among all the levels of reality, and all levels of being. If I seem to have developed what you might call a bad case of "disheartenment," it's because I see that all the information we need is out there—all the philosophies and spiritualities that could guide us through—were we but to espouse them. But make no mistake, we haven't espoused them, and now our problems may no longer be amenable to amelioration by such means. So the question really is, "What is it about the human race that prevents it from following its own wisdom?" We've learned so much, but failed to put it to use.

Q: Do you have an answer?

A: Like I said, I think we're a flawed species, and we've managed, unwittingly, through our many technological advances and our unwavering belief in them as desirable, to write ourselves out of the picture, Obviously this is very unfortunate, both for us and for all the other species of the world that we're taking out along with us.

Sometimes I think I shouldn't be talking like this at all—I don't enjoy the Cassandra role. A friend of mine sent me an article that she had written a year or two ago about "peak oil," and how supplies are running out. She described how whenever she brings the topic up in conversation at dinner parties, she never gets invited back. This is not the kind of thing that people want to hear.

There's a conversation I had with an artist friend of mine, James Marriott, who does environmental art work in England. (I think you can find the text of it on the website of www.greenmuseum.org). We get into an old idea of James Hillman's and Michael Ventura's from their book *We've Had a Hundred Years of Psychotherapy—And the World's Getting Worse.* What should you be doing when the ship is going down? I don't know that anybody has a suitable answer to that question. Something James and I discuss is, at what point do you actually accept the fact that the ship *is* going down, and how does that affect what you think or can do about the situation?

Q: *One of the things that seemed to happen in your life, and was expressed in magical ways in your memoir,* Living the Magical Life, *was that you seemed to turn to a larger sense of life and to invest yourself at the level of faith. Is that still there?*

A: Yes! I still find synchronicity the most interesting spiritual phenomenon that I've run into in terms of human experience. I consider it to be the biggest pointer to the possibility that there is indeed something out there that we can't see, something that may be orchestrating events in a way that we don't understand. If I were to say I had any hope for the human race—and to counter everything else I've said so far—it would be that if there really are such forces, they may be operating now in a way that could save us.

I saw a movie recently about the Mayan calendar ending abruptly in 2012. The speculative thesis about what this could mean is that maybe time as we know it, time as delineated by historical narrative and the continuity of a certain way of life, will suddenly come to an end in 2012, precipitated by we know not what. But the spin that many scholars have put on it is that there will be cascading crises that will lead eventually to opportunities for evolution. We will come out in a place of higher consciousness. I would say that it's possible. But the odds don't look that way to me. However, I'm only one person, and I may not have any special insight into the future.

Q: *One of the comments you make in* Living the Magical Life *is that the universe is a better organizer than we are. We just need to stay out of the way. Is that a principle that still applies under current circumstances?*

A: I am basically Taoist in my spirituality. Non-interference is a very Taoist approach. So yes, I do think that many of the problems we are experiencing in the world at this time are the result of human actions, especially untrammeled ego and ambition and greed. If you are a Taoist, you are trained to see yourself more as a speck of dust than as a towering rock star. Taoism says instead of striving for something, going somewhere, needing something, be happy over long periods of time with almost nothing. Economize. Simplify. Do not try to continue the pretense of more opulent times, as the *I Ching* counsels.

Q: *If the bus is going over the cliff—*

A: Russ, do you think it is?

Q: *I don't know. There's a very good chance that it is. History suggests that there are surprising things that happen that we can't predict. I don't know if it is, but I'm concerned for my children and my children's children.*

The question that came up for me was, if we're going over the cliff, and all we can do is either watch or close our eyes, is there anything about the transdisciplinarity or integral approaches that you see that helps us, at least if we keep our eyes open, better to comprehend what we're seeing?

A: I am of the persuasion that knowledge and the ability to confront and metabolize what's happening is the first order of the day. I absolutely agree with Alice Walker in this regard, when she says that even if there is nothing you can do personally—for instance, to stop the war—it's important to face what's really going on. People often avoid confronting how bad things are because they feel vulnerable and helpless, and are afraid of becoming too depressed. Alice Walker says we need to have the courage to be more depressed! I agree with that. She says that in today's world, where we are, who wants to be Little Miss Sunshine anyway? It's scary.

Q: *Could you be more specific about the things that you think help you get a sense of the whole picture that you're seeing?*

A: I'm a collage artist with a special gift for synthesis. It means that I can take the bits and pieces from everywhere and see how they connect, perhaps in ways that someone else might miss. That is, of course, the ultimate integral theory—which is that everything is interconnected. There is a wonderful Zen saying that embodies this: "When you pick up one piece of dust, the entire world comes with it." This is a basic idea that seems very hard for our atomized and individualistic society to grasp.

Richard Rorty, the philosopher who recently died, once said there is no big picture. He is very highly thought of, but personally, I think that is a stupid statement, an essentially misguided idea. I believe there is a big picture, and integralism—moving between inside and outside realms, between individual thoughts and collective worldviews, and seeing how all these things interact and interconnect, is very helpful. It creates a multi-dimensional, non-compartmentalized view of reality in which boundaries are permeable and divisions are transcended. Only then can one begin to grasp the infinitely complex cat's cradle that is out there. Without that grasp of the totality, it's no wonder that no one has any workable idea for a solution, say, to the Iraq problem, or any way to navigate through this awful maze.

Q: If the bus is going over the cliff, and you're keeping your eyes open, even if there are only a few minutes to be able to pay attention, is there anything you would be doing for your fellow passengers?

A: I think it's one of those situations that until you're in it, you don't know. If the real question is, "What is our task?" I suppose our task is, at the very least, to be constantly vigilant in considering what our task is, rather than mindlessly pursuing our own agendas. We can enter into the Apocalyptic mysteries, as one writer I read suggests, by looking seriously into the realities of the times. This is a "gift" to the community. Obviously, beyond that, we can try to mitigate whatever suffering we can and undermine the levels of destruction.

Q: A friend of yours is promoting a different way for us to be in the world. Riane Eisler's new book, The Real Wealth of Nations, *continues to build on her partnership model versus the dominator model.*

A: Her model of partnership was very influential for me in my early writing about art, to construct a notion of art that's built around relationship, participation, collaborative communities, and interaction with others. This is in strong contrast to the modernist construct of art as radically individualistic. The whole possibility of art as dialogue rather than monologue (an idea I also borrowed from David Bohm), puts it back into a *social* context, instead of the artificially constructed context of the marketplace. Putting art into the marketplace is, for me, a bit like putting animals into a zoo.

So much has come down the pike since then that much of this seems quaintly historical now, but the *modus operandi* for being an artist in this culture is still very much in lockstep with the idea of selling yourself and becoming an art star, even if it's only for the fifteen minutes that Warhol so astutely allotted. When you start to bring in something larger, such as a social purpose or a use value for art, you will still run into vociferous opposition from people who consider art's value to reside in the fact that it serves no purpose beyond itself. It's the paradigm of freedom and autonomy.

Q: The diagnosis of the world being already at its end is terminal, so it cuts out all possible interventions—we can keep talking until it happens—but the interventions of someone like Riane Eisler to shift to a partnership model, or the use of dialogue or any other human creation, doesn't it make all that seem rather pointless?

A: These ideas have been out there for a long time now. Riane's books, my books, many other peoples' books, have been out there for some 30 or 40 years. These ideas have taken hold on a certain level in the culture, but in terms of affecting any real transformation and change, what is your view? Do you feel that it's all happening, that we're getting closer to where we need to go?

Q: *For me, it's important to keep the focus on trying to create what's important, and that includes the survival of the planet. I'm not so sure there's a lot we can do at this point; that's partly why your position is so strong in my opinion, and difficult to react to other than with a sense of loss.*

A: And it was not what you expected.

Q: *I wasn't really expecting anything in that regard. I knew that your more recent writings were strongly about the political and ecological challenges we face.*

For me, as long as there's life, there's hope. I'm in agreement with you, Suzi, that we all need to do whatever we can to try and make a difference.

A: Have you read *The Road* by Cormac McCarthy?

Q: *No, I haven't. Maybe I'm avoiding the pessimist.*

A: Well, Russ, you're hardly alone in that! In the case of *The Road,* what McCarthy has done is to write a novel which takes place in a post-apocalyptic world; it is so cinematic and intense and drastically simple that you actually get to live inside that experience. You follow a father and son, who are two of the rare survivors in a disfigured landscape where everything has been destroyed. It's raining all the time and everything has become ash, and the two figures are slowly walking south, hoping to get to a warmer place. The scene McCarthy sets seems to me to be a more likely outcome of all these impending crises than this big transformative thing, but I could be dead wrong.

Q: *Others are suggesting that destruction of the human race is a step in the evolution of the universe. Who knows what our destruction will make room for? I'm reminded of a close friend whose grandmother taught her as a child to expect an apocalyptic event, the Nostradamus predictions that people see as predicting the end of the world. In our culture the doomsayers have always been people to laugh at, ignore, or treat as strange. It seems like the case you're making is that it's really where we need to be thinking these days; it's where we need to focus.*

A: It's a question of how reality-based one is, and how willing to enter into painful spheres of thinking. I agree with Alice Walker who says that we are living in "probably the most dangerous, frightening, unstable times the world has ever known." It's not a position that I necessarily want to defend; I'm just speaking from my heart, and that is how I see things. Pipe dreams and soap bubbles aren't working at this point. It's hard for me to deny what I see. Perhaps I have got a kind of negative spin on things. Who knows? But I can tell you that spending a year reading some ten books on jihadism has made me understand that we are in way over our heads. I don't know whether our government truly doesn't understand the forces it has unleashed, or whether they can't afford to admit what they've done—but what is clear is that I don't think we're going to emerge from this gracefully or intact.

Q: *Is there another book in Suzi Gablik's future?*

A: I don't know—some of my feelings about this can be found on my blog. I've perversely taken to blogging, given that I think technology is part of what's going to undo us in the end. Al Gore's newest book says that because of computers and the Internet, we can revivify our stolen and dismantled democracy, and rebuild it again at the grass roots. He doesn't mention the fact that the biggest tool for the Islamists is also cyberspace. It's the place where the jihadists are recruiting their terrorist converts and selling their anti-American propaganda around the globe. What we have defined as the "war on terror," they call the "war on Islam."

Q: The point there is that any tool can be used for various purposes.

A: No, I'm afraid it's not as simple as that. Technologies like the car and the computer are *not* neutral. They change us. They arrive in our world, and society builds all these narratives celebrating them. But then, they actually change our lives, and we become addicted to them. Only much later do we discover that we've got holes in the ozone, that we're destroying the biosphere, rewiring our brains, or that there is such a thing as cyber-terrorism. But by then, we've become prisoners of these technologies, and it's too late to change. We feel like we can't survive without them. Eventually, we hardly remember there was once a world where you could actually do things without having to mediate it all through machines.

The way we're going, there will be less and less that you can do that isn't mediated by technology. Once that happens, it will be very hard to live our lives any other way. So it's not just a matter of technology being good or bad only in relation to some hypothetical user's intention; technology affects things in ways we don't foresee and didn't figure. By the time we find out the consequences, it's too late to do anything about it.

Q: What is your blog address?

A: http://virgilspeaks.blogspot.com

I feel timorous that I sounded so bleak. You wouldn't know it, but I'm a great lover of life and believer in life. It's very painful to watch it all going under and being systematically destroyed. I find myself like an alien member of the human race—how can people act like this? How did this happen?

Q: If you weren't such a lover of life, then you wouldn't feel the pain.

A: Well, I suppose that's true. Sometimes I find myself thinking of the small bands of Eskimos that Gretel Ehrlich describes in one of her books. Even when they are starving, they laugh and enjoy life. They are not fazed.

Q: Thank you very much Suzi.

Reactivity to Climate Change

Jan Inglis

For many years, public discourse concerning climate change seems to have been divided into two main camps: those who did believe it was occurring and cited experts and years of research that proved the planet was warming up, and those who did not believe that these indicators were anything more than isolated events. A subtopic of the former position also divided into two camps: those who thought climate change was due to human causes and those who thought it was just a natural cycle. These debates have preoccupied attention, polarized local and global consideration, and failed to contribute to any coordinated responses. Instead, they seem to have prevented or at least distracted a process in which such responses could be initiated. The structure of these arguments has largely been conceptual and factual.

Once connections were made between tsunamis, Katrina, wild fires, floods, droughts, ice storms and undeniable changes in weather patterns, a picture of the whole constellated. The discourse eventually moved from conceptual and factual arguments to lived experience and pattern recognition. It seems that a “tipping point” in public recognition of climate change has been reached. At least from my North American observations, during the middle of 2007, a profound shift in public discourse has been occurring. It indicates an acceptance that climate change is really happening now, and that it is growing exponentially due to human activity. General public sentiment seems to have landed on the side of agreeing that we have a very real problem that needs to be faced collectively. The discourse has moved well beyond its former argumentative positioning to a place where shared meaning is possible.

This new shared meaning might herald a take-off point that could support a comprehensive societal response. However, within just weeks or months of the development I described above, I have noted the formation of yet another polarity in the discourse. Both poles share the characteristic of faulting the other. One camp is faulting those who present forecasts of climate change as being too alarmist and too negative with potential to cause people to be overwhelmed and then shut down. The other camp is faulting those who present positive images of the future and human capacity to make a difference as being too soft, and not really dealing with the incredible challenges we are facing. The fault-finding voices have replaced conceptual and factual arguments.

I have also observed a subtopic of that debate arising: the question of whether those who espouse the need to take action are themselves “pure.” For example, Al Gore, recent winner of the Nobel Peace Prize, has been publicly criticized for his large house and its energy usage. David Suzuki, Canada’s environmental guru and geneticist, is criticized by people who check out his grocery cart in the line to the teller, and then announce publicly that some of his food choices are not as wholesome as they “should” be.

SOME RIGHTS RESERVED

My observation is that the topics have shifted but the style or structure of public discourse underlying the topics may have remained the same. In each of the cases noted above, the structure was dualistic, one set of arguments or judgments pitted against another.

These dynamics have consequences. Embedded in this apparent need to categorize, label, and judge is the framing of climate change as an "out there" thing. When put "out there," that "thing" seems to motivate a narrowing of public attention to focus on which camp one belongs to with respect to the "thing." This distances *us* from *owning* the issue, which happens to be *our* issue. It interferes with the necessary exploration of the full gamut of concerns and responses that are naturally arising. So our discourse can become perilously reduced to talking about others talking about the "thing" without addressing the thing itself.

The kind of thinking behind this discourse does not help us make vital connections, such as seeing the whole picture *and* seeing ourselves in that picture *and* seeing the causal links to the ecological challenges we face. When we do not recognize that our own thinking and behaviour is contributing to the issue—i.e., has causal links to the very development of the issue—we ourselves, by our limited perspective, hinder adequate responses to the issue. I see these dynamics as splitting apart things that already form a whole. This then blocks the whole from being in our line of vision just when we need most to see it.

> The . . . world begins by making splits, then drawing boundaries, then solidifying these boundaries. Then we fool ourselves into believing what we have made ourselves see. Solidifying boundaries is very comfortable, because it allows us to deny our experience . . . We miss the whole system. (Bateson, 1978, as quoted in Campbell, 2006)

I have been considering these observations through the lens of developmental dynamics. In particular, I have been categorizing these as transitions from tasks at one stage of hierarchical complexity to another (Commons, Rodriguez, Miller, Ross, LoCicero et al., 2007). Commons et al. describe steps that range from thesis to antithesis to relativism and then through a chaotic "smash" to an eventual synthesis. Earlier arguments, described above, were thesis-antithesis ones, e.g., from there is no climate change problem to yes, there is a climate change problem. And, from it not being human caused to yes, it is human caused. A movement seems to have occurred but are we now sidetracking ourselves, procrastinating, in a hidden relativistic either/or phase, e.g., either we will or we will not step up to the plate and tackle this problem? Does this pattern of drawing boundaries and labelling camps suggest a reticence to move out of the reactive phase of relativism, into the chaos stage?

The chaos stage brings with it recognition of unknown outcomes. In the case of climate change, it also includes the need to commit to engage the issues enough to understand their multiple layers (including personal and cultural values and behaviours), to create and sort options, and to consider all the various responses. This represents a movement *toward* the issue, and *toward* synthesis. By contrast, to frame the topic as a debate of "us and them" and "for and against" camps keeps the discourse at a superficial, possibly more distant, and thus more comfortable level. Such approaches represent a movement *away from* the issue, and *away from* synthesis. They take us back to the antithesis phase of transition instead of forward into the chaotic stage of working things out.

In summary, my observations suggest that at present, intense focus on climate change and pent up concerns seem to be milling around in the comfortably familiar territory of dualistic dynamics rather than moving forward. More complex styles of thinking are needed to shape public discourse and to bump up our attention to climate change to a higher level so we can get focused on effective cultural engagement to address it. Such forward momentum may allow us to move beyond the seemingly natural slide to comfortable dualisms. While these are natural, even necessary parts of the transitions process, they are unproductive on their own for addressing such a complex and pressing issue as climate change. By naming these dynamics and reflecting on their impact, perhaps we can see our way into that forward momentum—and maybe even to addressing climate change with the complexity of engagement and coordination it demands of us.

Developing *Integral Review*: IR Editors Reflect on Meta-theory, the Concept of "Integral," Submission Acceptance Criteria, our Mission, and more.

Introduction

Over the past three years our journey as editors of *Integral Review* has been full of rich learning. The processes of providing authors with feedback, going over reviews of articles as well as writing ourselves have all contributed to our growth. The primary forum for this learning has been the many conversations amongst us to deal with the various issues that arise in publishing IR. Our intention in this brief piece is to share some of our reflections on this learning journey with you. These will take the form of contributions/reflections from individual editors, allowing us to share with you the particular issues we feel of value in this process.

By writing these short pieces, we aim to provide additional resources for understanding how IR works. While we have guidelines and criteria for submissions on our website, it seems that narrative voices from individuals may add some flesh to them. Relating how we perceive issues around writing for an “integral” journal offers a supplement for engaging these criteria, and will hopefully bring them to life. As well, we hope that our writing provides insights into how and what we think about issues relevant to IR’s mission. These pieces reflect the unique voices we have as editors of *Integral Review*, and demonstrate some of the thinking and passions behind this journal.

Russ Volckmann

I believe my most significant contribution to *Integral Review* during this “start up” phase has been the interviews I have done with people whose insights and publications contribute to our processes in significant ways. By processes, I mean the community’s ability to reframe and build a metatheory that allows us to incorporate the brilliant ideas and perspectives so often confined to academic disciplines or labels that often exclude, rather than invite.

Integral Review is an invitation, foremost. It is an invitation to participate in and contribute to a process that I hope will lead to approaches to framing our world, our experience, and our aspirations in ways that generate far more hope for our future than fragmented approaches are capable of doing. There are some arenas in which the fragmentation is welcome; after all, specialization leads to a quality of expertise that brings us products and approaches that help us address the challenges we face. We can find such specialization in many, many places. By adding a meta-theoretical perspective, however, my hope is that we can reduce the unintended consequences that lead to the destruction of the planet, its societies and its people.

SOME RIGHTS RESERVED

Those I have interviewed represent interests in integral theory, management and leadership, conflict management and the work of defense organizations, art and the complexity of our world, and particle physics and transdisciplinarity. Each is interested in ideas and action, equally. One without the other is, well, full of hope, perhaps. I know of no other publication that would provide a home to such diversity and richness. Things I have learned from this process include that there are individuals out there who have been working from an integrative perspective for decades. This has led to pessimism on the part of at least one, to more creative work on the part of all, and the creation of an intellectual space intended to support the vision that I hold for engagement in a generative lifestyle and the purpose that *Integral Review* serves in support of this.

Thomas Jordan

It is probably impossible to summarize the criteria of good scholarly work in a way that the academic community would agree on. Here is, however, one view that might serve as a starting-point for discussions. There are many paths to meaningful knowledge, the path the scientific community has chosen is only one, but one that has certain strengths. These strengths come with limitations as well, which means that science should be seen as a particular genre in the broader quest for knowledge. The goal of science is to produce tenable knowledge. We are nowadays aware of the perishable nature of absolute truth claims, because we know that all such formulations depend upon the characteristics of the discourse in which they are embedded. Therefore we no longer think of science as step by step building an ever larger body of true statements about reality. But still, the task of science is to strive for knowledge that is as tenable as possible, which generally means that when we make assertions about anything, we are supposed to have good arguments for the validity of the assertions.

A lot of the criteria generally used to define the genre of science follow from this basic task formulation. We expect scholarly texts to be stringent in their use of concepts. We expect that authors take care in formulating the purpose and research questions of their investigations; to describe how they have proceeded in order to seek answers to their questions; we want to have explicit and precise statements about what conclusions the authors have made; and we expect the authors to support their conclusions by arguments that are transparent, stringent and reasonable. A very characteristic quality of the academic community's style of knowledge seeking is that we are very sensitive about validity claims. As soon as an author makes any kind of assertion, i.e., claims that a certain statement should be regarded as valid, the academic instinct is to check whether the validity claim is reasonable. Some assertions need not be supplied with supporting evidence or arguments, simply because nobody would challenge their validity. If I say that WW2 ended in 1945, I don't have to prove this assertion, because it is generally known and accepted as a fact. But as soon as a validity claim is not self-evident or generally accepted as valid, the author of a scholarly text should take care to specify what evidence or argument the author feels is strong enough to support the validity claim.

In a scholarly text, authors cannot simply make assertions about reality just on the basis that something seems plausible, sounds reasonable or is appealing because it conforms with the authors' values or expectations. We expect authors to be more critical, to discuss supporting evidence (e.g., empirical data or logical arguments) and alternative interpretations. A text that formulates a theoretical framework mainly by formulating principles and specifying details by deductive reasoning may be a valuable contribution, but then the author should stick to the realm of theory formulating. As soon as a statement is made about reality, it is not sufficient that the statement sounds plausible or attractive; there must be reasonable arguments that support the validity claim.

We sometimes get manuscripts that seem to be the product of an author trying to make sense of a particular field by interpreting it through a theoretical framework. It seems that the main criterion used by the author when making validity claims is that the framework seems to make sense to the author him- or herself. Developing a theoretical model may be a perfectly valuable contribution in a scholarly community, but it is problematic when the author simply claims that the concepts used in the model explain or correspond to certain empirical phenomena without really examining whether there is supporting evidence for making such claims.

Bonnitta Roy

It seems to me rather unfortunate that the term *integral* has been associated with the notion of "A Theory of Everything." In a recent dialogue hosted by *Integral Review*, a revision to "A Theory *for* Everything" was proposed—but even that seems to me to be problematic. While I consider the term "integral" to refer primarily to noetic enterprising, the notion of theorizing about everything seems somewhat at cross purposes to the integral embrace of body, mind and spirit. I believe that what is integral about *integral* is the capacity for integrating thinking, doing (including communicative acts) and being.

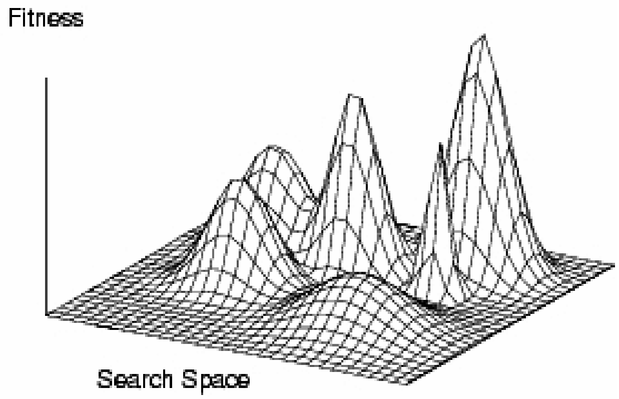
While an important critical component of *integral* is the articulation of distinctions, too much abstract theorizing results in the stratification of existence into a dizzying complexity of parts, and the hyper-intellectualization of the person at a loss for the whole being-in-Being. The product of this kind of hyper-intellectualization is the belief that reality is really composed of the discrete parts that we continue to identify. This puts us in the unfortunate position of having to create complex frameworks to explain how the parts fit together to retrieve a *really whole* reality.

Humpty Dumpty fell off a wall . . . all the king's horses and all the king's men . . .

Rather, it seems to me that *integral* is the art of nuancing the whole—in teasing the creative flavors of our being from the whole of Being. It is as if we are children lying in the deep grass on a sunny day, watching clouds. I spy a rabbit and then you see it too. You spy a wizard, and then I see it, too. Joy.

Then again, it seems to me there is an inherent telos associated with the notion of *integral—a direction toward increasing view*. Here again, it is unfortunate that it is fashionable in some circles to imagine integral as the *one view* from 30,000 feet that captures everything else. This has created a kind of reality TV mentality in the integral community, where we get to vote people off our island until one guru remains. This can be quite ugly at times. If instead of thinking of view as a complex abstraction that contains everything and everyone—truly a great hubris that dogs the integral community—we imagine the telos of *integral* as being a direction toward increasing degree of freedom. I have argued in this journal and in the dialogues hosted by IR, of just this notion of *view as degree of freedom*.

It occurred to me recently to think of *integral* in terms of a noetic *fitness landscape* where there are several views from 30,000 ft, and 25,000 ft, and 5,000 ft—and they are all equally relevant to the meaning of *all things integral*. This notion of fitness landscape has been used to understand evolution of all kinds of systems, including economic and biological. A graph of a fitness landscape looks like this:

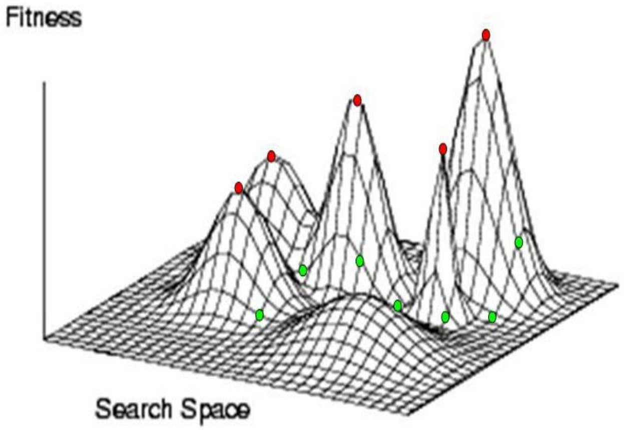


The hypothesis behind a fitness landscape is threefold:

1. The system seeks to maximize novelty.
2. The system is wholly autopoietic, that is, inputs and outputs are coupled and co-generative.
3. Agents and environment (figure and ground) are co-creative.

When thinking about evolutionary dynamics, the tendency is to in-animate the environment and animate the activities of potential agents with respect to the environment. The environment becomes a passive and negligent ground of activities among agents. This is at odds with both the notions of a wholly autopoietic system and the co-creative process between agents and environs. Not surprisingly, such a system does not maximize novelty.

When we focus mostly on cognitive adaptations, or a single summit of knowledge—that is the mistake we are making. We are dispossessing the environment and the process of their role in maximizing novelty. When I think of the noetic enterprise, *integral*, in terms of a fitness landscape, I think of the search space as the ground of Being, the contours of the landscape as the ascents of our being, and the summits of the landscape as the novel noetic points that emerge in a wholly autopoietic, generative process. If in this landscape, I plot specific noetic points (the red and green dots) as shown.



I can ask myself what are the kinds of relationships between the noetic points, the topographic scales and the relative heights of the summits. If *integral* is a noetic enterprise that emerges from a wholly autopoietic process, then the red points represent the greatest novelty (most emergent ideas) in the system. I imagine these points collectively as *integral thinking*. I imagine the topographies as *integral doing* – the paths that takes being there. And I imagine the search space as the ground of Being.

But when imagining the telos of *integral* as degrees of freedom, my interpretation shifts. The red dots are actually older, more stratified noetic points, and the new forms are continually being renewed from the fabric of the search space. In other words, the up rush of the tectonics of freedom *are from the search space, the very ground of Being.*

As the word *integral* generates new meaning(s) for us, I think it would be helpful to be mindful of the whole of which *integral* is not any single summit, but an essential part of the landscape of being-doing-thinking from which its own creative novelties are emerging. As we speak.

Tom Murray

"My well written AQAL-based paper was rejected by *Integral Review*—what's up with that?"

In many circles the term "integral" is so strongly associated with Ken Wilber and the Integral Institute that it is worth taking some space here to clarify *Integral Review*'s relationship to Ken Wilber, his work (particularly the AQAL model), and the Integral Institute which he founded, in part to help potential contributors understand how we evaluate submissions for publication. As I do so I will also discuss why we look for works that take a metasystematic perspective on one or more models, rather than simply apply a model.

Wilber's prolific, popular, and deeply insightful writing has been a major force of influence on the community of thinkers drawn to integral, holistic, trans-disciplinary, and systems-theoretic philosophical approaches. Following Sri Aurobindo and Jean Gebser before him, Wilber began using the term "integral" to describe his model around 1983, at the beginning of what some call the "Wilber-III" phase of his writing. Because some associate integral theory entirely with Wilber, it is worth noting that his approach is one of many approaches (the most widely known) that wrestle with the philosophical questions drawing the integral theory community together. *Integral Review* is "A Transdisciplinary and Transcultural Journal for New Thought, Research, and Praxis" and its editors are interested in a variety of interpretations and treatments of integral theories, provided they are of sufficient quality and originality. IR does not limit itself to pieces that explicitly deal with "integral," but this essay discusses our approach to evaluating submissions that do.

At the center of Wilber's work is his AQAL model of "quadrants, lines, levels, states, and types" (see "A Theory of Everything," 2000). We at IR sometimes receive submissions that illustrate rather straight-forward applications of AQAL theory to some domain (education, leadership, health, art, etc.). Such papers illustrate how the theoretical and practical elements of a domain can be conceptualized as conforming to the AQAL model, and note how insights from the AQAL framework illuminate key questions of their domain. We usually suggest that the authors of such pieces submit them to the Integral Institute's AQAL Journal (http://aqaljournal.integralinstitute.org), which specializes in applications of the model. IR and its editorial board have no official affiliation with the Integral Institute (or its many branches) or AQAL Journal. Though the IR editors owe a debt of gratitude to Wilber for his influence in defining many of the key issues of the field, and for galvanizing wide interest in them, none of us see ourselves as working strictly within the AQAL model, and we each have our own critical intellectual relationship to the AQAL model.

IR publishes a variety of genres, including scholarly papers, artistic pieces, and opinion essays. For scholarly papers, one can make a rough distinction between those that share a new finding and use a model or framework to explain the finding, from those that reframe known material in some new way through the use of a model or framework. In both categories the scholarly submissions are of course evaluated in terms of rigor and originality, and (among other things, see http://integral-review.org/submissions) whether there is a clear indication of what the contribution is. For the former, it is the finding that makes the main contribution, and the model or theoretical framework constitutes the language used to communicate it. My comments here are mainly about the latter case, in which the main contribution relates to the model or theory itself, especially those offerings that promote or valorize a particular model. In such cases it is even more important to approach the model itself as an object to be examined.

In deciding what to publish we give preference to perspectives that employ what has been called vision logic, metasystematic thinking, integral-aperspectival reasoning, etc. (overlapping but non-identical post-formal reasoning signifiers with a range of meanings in the literature—I do not have the space to attempt to define them here). Though it requires this level of thinking to invent something like an AQAL model, the straightforward and uncritical appropriation of any model or theory does not exemplify this type of reasoning. This is not to say that such a work does not offer anything of value to the integral community, but only that it is less likely to be appropriate for IR. Integral or metasystematic treatments of abstract models or theories demonstrate an awareness of the epistemological and pragmatic limitations of such abstractions, and some reflection upon the limitations of the writer's context (though such awareness may be communicated implicitly or lightly).

Thus, submissions that are strongly based on a particular model (e.g., AQAL) should maintain a certain objective distance from that model. This level of reflection is one thing that distinguishes scholarly work at a metasystematic (or one could say "second tier") level from standard scholarly work, which often takes an embedded theoretical model for granted. Studies *exploring* a model should be constructed so that they can question, refine, or refute elements of the model. Treatments taking models as an assumed *starting point* should clarify how these assumptions might constrain the conclusions. *Applications* or case studies of models in realistic contexts should report "lessons learned"—i.e., what worked and what did *not* work as expected, with conjectures on the reasons and implications of failed expectations or refuted hypotheses. Papers proposing *new* models should supply ample support and clear examples.

Authors are encouraged to maintain or aspire to a certain objectivity, yet with an awareness of the "myth" of complete objectivity. That is, bias of various sorts is inevitable—authors work within the horizons of particular world-views and disciplinary paradigms, are subject to the "bounded rationality" ubiquitous in human reasoning, and come to their work favoring certain outcomes or valorizing certain beliefs. But each of these biases can be compensated for to some extent, or at least reflected upon. Integral forms of inquiry reveal subjective and intersubjective as well as objective factors that contribute to conclusions, to more fully contextualize these conclusions for the reader.

In closing I will mention that our formulation and application of article acceptance criteria is an evolving system. The explanations given above concerning publication acceptability are both in process and not straightforward to apply to each paper submitted. The journal is relatively new and exists to explore relatively unexplored territory with undefined boundaries and unclear standards for an emerging and equally nebulous community. Each submission has the potential to stimulate dialog among the editors about the interpretation or content of our acceptance criteria, and even about the makeup of our intended audience. In co-creating *Integral Review* we try our best, thrash, revel, and celebrate in the uncertainty of it all, and happen to enjoy the process very much

Sara Ross

I harbor high hopes for the contributions *Integral Review* (IR) can make to contemporary issues and fields of endeavor. Those hopes come with challenges to realizing them. I want to use this space to articulate some of the challenges I see because some seem steep. I think these challenges go hand in hand with IR's mission, and for that reason, warrant public discussion.

For the scope I want to treat here, IR's mission can be summed up in a few words: To disseminate—and encourage more of—the awareness, development, and application of high stage action-logics to contemporary issues. Applications may take a wide range of forms, anywhere from research, theory-building, and analyses, to reflections, evaluations, creative works, and process designs. "High stage action-logics" refers to measurably complex behaviors including reasoning at stages called, for example, Strategist and Alchemist in Torbert's framework[1] and correspondingly, Metasystematic and Paradigmatic in Commons' framework.[2] These and subsequent stages are capable of and necessary for generating "integral" work. In my usage, *integral* draws on the dictionary sense of *essential to completeness* for the task at hand.[3] To me, in brief, such completeness means comprehensiveness that is both pragmatically contextualized and holistically so.

Given that scoping of the mission, what are the challenges that seem steep? I categorize them in terms of constraints. These constraints seem attributable to time, institutionalized demands, and conceptual assumptions. While these are interrelated in many respects, for the most part, I treat them only separately here.

[3] It would be great fun, and challenging work, to develop this idea in its own article, particularly the task dimension. There is a practical need for methods to evaluate and even measure sufficiency or "completeness."

Time

I recall a professor telling his class years ago that when he was writing a paper, he required, on average, only one half hour to generate each page of writing. He was a speedy writer whose reasoning, I had noticed, was quite linear. By contrast, some people I know report that it often requires two or more hours to craft one or two solid paragraphs. I have worked with authors who require many months, in some cases years, to bring their complex understandings, theories, and analyses into an articulated, written form. I recall a scientist telling me recently that he had finally solved a question he had been working on for 30 years.

I have read published works by high stage thinkers who are making major contributions to understanding and working in our complex world. I have invited some of them to contribute an article to *IR*. Much of the time, despite expressed interested, they say they must decline for lack of time to do so. I know some practitioners, non-academics, whose insights and approaches would benefit other practitioners and genuinely deserve dissemination, were they ever written up. The world of published writing is not in their normal orbit, and the prospect of responding to an invitation to submit any kind of written work feels too challenging to take on alone. They would need a mentor or assigned editor to work with them, thus requiring a great deal of time for both parties.

The purpose of this litany is to highlight that high stage action-logics typically find it very time consuming to make written contributions. Whether short or long in length, the types of contributions IR is eager to publish require time in a world where time is a precious commodity.

Institutionalized Demands

For those who are academics, there is tremendous institutional pressure to get articles published. One might think that would support motives to submit works to IR. In the “publish or perish” world they inhabit, however, it is not necessarily that simple. There seem to be two related challenges here. One is that academic disciplines operate much like silos, with their contents segregated from others’ to maintain their distinct contributions. To remove walls that compartmentalize disciplinary knowledge still seems to represent, in many quarters, a watering-down of the disciplinary boundaries. To publish work in a transdisciplinary journal could be “as if” one had not published at all, apparently for two reasons. The first reason is access-oriented, the second is assumption-oriented.

Particularly given the continually growing plethora of electronic journals, one’s work in a given discipline could be more difficult to find by others in that discipline, depending on where it is published. Huge numbers of journals now exist. Indexed databases make their articles easier to search and find: some journals are indexed in traditional databases, some are in nontraditional databases, and some are in no such databases. Many databases are not open-access, but require paid subscriptions. Databases, like universities and journals, are assigned status based on experience and usually long-standing assumptions. To publish in a journal that is not indexed in the discipline’s expected databases can mean relative invisibility to target audiences. To publish in a journal that is not dedicated to one’s discipline increases difficulty to be noticed in one’s discipline. Yet, once one is integrating multiple disciplines’ approaches in one’s work, it becomes more difficult to be accepted for publication in the home discipline's often silo-like journals. More and more, of course, there are multidisciplinary approaches taken under one discipline's umbrella, and this is reflected in some journals' missions: a hopeful sign of things to come.

The parallel institutionalized demand in the publish or perish world is to get one's work published in the journals with the highest impact factors. For those seeking tenured status, this matters: the higher the impact factor, the more weight assigned a published article, and the more articles published in journals given such weight, the better the tenure application looks. The faculty tenure system is a major institutional influence in the world of publishing.

Not all who wish to submit works to IR are concerned with tenure issues. Some are not in academia, and some are already tenured. They still may wish that people in their home disciplines read their good work in journals that serve the discipline, but not necessarily exclusively. People who want to publish in IR may tend to seek out transdisciplinary venues when their home fields are more specialized. Given these and other institutionalized demands—not least of which is, again, time to produce and/or to find and read articles!—straddling the disciplinary *and* transdisciplinary publishing worlds makes generating articles for "both/and" publishing solutions difficult for people to operationalize.

Conceptual Assumptions

I suspect that realizing IR's mission in a fulsome way has challenges connected with particular concepts and assumptions about those concepts. The presence of a concept can present certain challenges just as much as the absence of a concept can present other challenges. To begin at the beginning, though, it is always advisable to define terms; a discussion of concepts is no exception. The dictionary meanings of "concept" are "something conceived in the mind (thought, notion)" and "an abstract or generic idea generalized from particular instances." The dictionary does not unpack the significant social and developmental implications of those definitions. For example, the same concepts can *appear* to mean the same thing, yet at each stage of development, users can assign very different meanings to them.[4] Assumptions about certain concepts, one of my stated concerns, also have social and developmental implications. However, though they could enrich the points I wish to make, space here is limited and I defer those explorations for another day. As an alternative, I propose those definitions are useful reminders that concepts are mental constructs, and mental constructs are not "real things." They are used to *refer to* innumerable things. Some of those things may be rather concrete, such as the concepts "dirt" or "chair." Others may be quite abstract, such as the concepts "concept" or "theory."

Concepts and assumptions about them inherently matter to any publication. It is also true for IR's mission, not least because its very title is made up of many concepts. Of those, ones that I think especially warrant examination are *transdisciplinary, transcultural,* and *integral.* Here, I prioritize only one, to discuss conceptual assumptions surrounding *integral.* As works published in IR have indicated, for some, this concept is tethered to something called "integral theory." I will call this Group A. For others, it refers to high stage action-logics that show up in such ways as perspective-taking, worldview, reasoning, and/or general ways of being-in-the-world (and many different concepts have been used to describe these qualities). These behaviors are independent of and irrespective of something called “integral theory.” People with these behavioral action-logics are very often unaware of that and thus unaware of others linking “integral” to it. I will call this Group B. Others are familiar with both Group A’s and Group B’s respective meanings of “integral” and move fluidly across contexts that use either. I will call this Group C. For yet others, none of the foregoing concepts are relevant. I will call this Group D.

---

[4] There is more discussion of this in Ross, S. N. (2008). The challenges of postformal (mis)communications: Speaking different languages. *World Futures: The Journal of General Evolution*, forthcoming special issue.

If these seem to be more or less facts of life, how do they present any challenges for realizing IR’s mission? I think some challenges surface if there are implicit assumptions—and the focus here is on conceptual assumptions related to “integral”—that IR’s mission pertains to only one of the groups identified above. If they exist, such implicit assumptions spill over into decisions about submitting work, reading, and referring others to IR. These decisions directly impact IR’s mission.

Thus, there are authors who want to submit work for publication somewhere they consider a good fit (I will call this Group 1), potential readers of IR (I will call this Group 2), and others who hear of IR and may refer others to it, whether or not they have read it (I will call this Group 3). People in these three groups may fall into any of the groups previously identified (A, B, C, or D). These three “decision groups” are arbitrary divisions that are not mutually exclusive (e.g., someone who reads IR may also submit work to it).

These groupings result in the sorts of relationships between decisions and assumptions indicated in the following two tables. Decisions may be based on possibilities or constraints pinned to various conceptual assumptions. In Table 1, people in Groups 1 through 3 assume there is only one relevant way to conceptualize “integral” (implicitly, “my way”). Taken as a given, it poses no constraints on deciding (“X”) whether to submit, read, or refer others. This set of conditions poses no challenges to realizing IR’s mission.

Table 1. Partial Portrayal of Decision Implications of a “Match” in Conceptual Assumptions

	I assume IR’s use of “integral” matches or includes “my way” of using “integral”		
	Group 1 Wants to submit work to a good-fit journal	**Group 2** May read IR	**Group 3** May refer others to IR
Group A Use of concept “integral” is tethered to “integral theory”	X	X	X
Group B Use of concept “integral” is unrelated to “integral theory”	X	X	X
Group C Use of concept “integral” is adapted to contexts of Group A and B	X	X	X

In contrast to the foregoing, Table 2 indicates some possible differences in conceptual assumptions, which would imply constraints in decisions to submit, read, or refer others to IR. Of course, anyone may be attracted to read an occasional article. But here, "read" means regular reading of IR issues. These combinations seem to pose challenges to realizing IR's mission.

Table 2. Partial Portrayal of Decision Implications of a "Mismatch" in Conceptual Assumptions

	Decision if I assume IR means only Group A's use of "integral" **i.e.,** where Group A use of concept "integral" is tethered to "integral theory"	**Decision if I assume IR means only Group B's use of "integral"** **i.e.,** where Group B use of concept "integral" is unrelated to "integral theory"
Group 1 Wants to submit work to a good-fit journal	If member of Group A or C, may submit; If member of Group B or D, unlikely to submit.	If member of Group B or C, may submit; If member of Group A or D, may be less likely to submit
Group 2 May read IR	If member of Group A or C, may read; If member of Group B or D, may be less likely to read.	If member of Group B or C, may read; If member of Group A or D, may be less likely to read.
Group 3 May refer others to IR	If member of Group A or C, may refer others; If member of Group B or D, may be less likely to refer others.	If member of Group B or C, may refer others; If member of Group A or D, may be less likely to refer others.

Conclusion

The challenges identified and portrayed briefly above may be interesting to give much more attention in a variety of ways. These challenges are not likely to disappear any time soon, nor should they. My expectation and motivation for putting these challenges on our collective table is that they will benefit from public discussion. Such discussion may surface more such challenges, more clarity, and/or more concepts. All such discussion has potential to transform and re-frame challenges just as much as it has potential to broach possible ways to address them. I think we should welcome all of these potentials with hopeful anticipation!

Jonathan Reams

Reflecting on the evolution of my perception of "integral" over the past three years, I find myself guided by a sense of not knowing. Taking understanding to always be provisional helps me stay open and allows me to learn a great deal from my colleagues, authors, and reviewers. For me to define "what integral is" would feel in some ways like reification, a deadening that could lead to a mechanical advocating for integral dogma. One of the goals at IR is to support a space for the exploration of "what integral is," and doing this from a fundamentally inquiry oriented approach has led to a broad set of literature touching on many aspects of integral, from theory to practice.

While holding this openness to inquiry and "not knowing," we also are guided by a sense of "knowing" that while having a kind of fuzziness to it at times, also enables us to recognize what we are looking for when we see it. While we may not always agree upon everything, our collective inquiry of discernment around each submission produces a degree of coherence to the journal, and a great deal of organizational learning!

From these engagements with my colleagues, authors, and reviewers, the work of IR has deepened my capacity to make finer distinctions about the nature of things integral. Often it is through a process of finding that what I thought it to be is not quite it, or that there are nuances to be gained from taking a variety of views munched together and disentangling the enmeshed threads of thought. Serving in this role has also enabled me to broaden the scope of what I perceive as falling under the umbrella of integral, recognizing it in an ever-widening set of domains.

In my contribution to this editorial essay, I would like to quickly overview some of the learnings that have emerged for me. I will focus on three areas; the map and territory issue, the relationship of states and stages, and notions of integral and integrity.

One common issue we find in a number of submissions is varying degrees of weakness in mapping from a theoretical model (such as AQAL, but others as well). This often shows up as a kind of checklist approach to how the model applies to a given topic. While such mapping can serve a useful purpose in illuminating aspects of a topic often neglected, or in aiming for a synthetic overview of the topic, the challenge of doing justice to this approach makes the task very difficult. I often recommend to authors to focus on a particular aspect of the topic that the model addresses, and go deep into that territory.

Another type of challenge arises when we attempt to write about things that are on the horizons of our awareness. By this I mean that ideas we are currently exploring and trying to sort out are very hard to take sufficient perspective on and communicate clearly to readers. This is more of an example of being lost in the territory, and not yet having created enough of our own map to enable us to describe where we have been. Thus we may end up relying too much on the maps of others, losing our voice in the process.

This issue also touches on another ongoing conversation with colleagues, around the conflation of intellectual appropriation of a theoretical model with a subtle identification with the view of the model. Keith Bellamy posits an integral awareness developmental line[5] that identifies stages such as emergence, associating, proselytizing, rational, and discerning to note how our relationship to integral theory can grow over time. In addition to the time and experience it takes to go through such stages, there is also a factor in play related to the high degree to which we tend to equate intellectual activity with cognition and consciousness. From these (and likely other) factors, it appears that our ability to intellectually grasp a theory or model may lead us to also think that we are seeing things as the model (or the model's creator(s)) would. Yet reflecting on this in a number of conversations, it would seem that there is not yet enough widespread understanding of how stages of cognitive development or even states of consciousness will filter the theoretical model to fit within our already existing understanding. Thus we can fall prey to conflating our view with the view of the theory or model.

---

[5] http://www.integralleadershipreview.com/archives/2006_03/2006_03_bellamy.html

This leads into the second area I want to discuss, the relationship of states and stages. It seems that there has been an emphasis in much of the integral literature on how structural stages or action-logics impact most everything. I think that this has been important, as the action-logics that we operate from will have a central influence on how we engage in the world. But as we study people and their behavior up close and personal, we recognize that there is more to the picture. Not everything can be accounted for by this method of slicing life experience. And of course an integral view explicitly includes many other elements. But how can we hold more of these elements in awareness at once?

One way of conceiving of the relationship between action-logics and states of consciousness has recently been put forward by Terri O'Fallon.[6] In her preliminary offering on this topic, she describes how observation of course participants (whose sentence completion test scores were known) led to recognizing the role that access to deeper levels of state experiences play in shaping the space we engage the world in.

This space can be mapped in a simple manner by drawing a V, with one side representing structural stages of cognitive development, and the other access to various levels of states of consciousness. The two points available to an individual can be linked, and a space delineated from this. This space is the territory they can roam in so to speak. Thus the range of options for engagement available to an individual are now able to be mapped in a rudimentary way as dependent on a combination of these two aspects of their makeup.

Further conversations have also explored ways in which structured experiences can be used to enable people to gain at least temporary access to deeper states of consciousness. (My piece on Otto Scharmer's U Theory illustrates one example of this). There is then a further question of the impact of the capacity of the facilitator to utilize their own access to states to enable others to experience them. These factors can then be examined in relation to action-logics, leading to asking what degree can people operate "over their heads" while supported by these other factors? A further question that arises focuses on how such experiences can support stage development. Sara Ross' description of her work in issue #2 of IR is an example of research in this area. These and more questions offer exciting avenues of inquiry for future exploration.

Earlier I mentioned Keith Bellamy's notion of an integral awareness developmental line. In that article he notes that his preliminary finding "cautions against the overt teaching of theory and argues the need to practice what we preach." This speaks to the third issue I will discuss, that of integral as integrity. The two words appear quite similar to each other, and there is a simple way in which being integral should mean having integrity. After all, if we have managed to integrate all of these various aspects of our lives that we are now more aware of through this powerful map of the complex territory of human experience, we should be able to enact a kind of alignment of values and actions. Or in other words, what are integral ethics?

This is no simple question. There are of course vast volumes of literature dedicated to questions of ethics, and one question could simply be what could an integral perspective add to what has already been said? While this is also an area open for future exploration, I do have one thought about the demands that knowledge of an integral view of the world can make on us. It comes from viewing integral as transcending and including the rational analytical mode of consciousness (see Jennifer Gidley's thorough description of this in her article) predominant today. In the transcending, a different kind of view of truth can emerge. This has to do with a notion of truth not as a noun, a thing to be found, pinned down and defined as in a rational view, but as a verb, a living engagement with life.

---

[6] http://www.integralleadershipreview.com/archives/2007_11/2007-11-article-ofallon.html

I have found this concept discussed in a manner that resonates for me by Parker Palmer in his book *To Know as We are Known. Education as a Spiritual Journey*.[7] Palmer talks of the ethics of knowledge by saying that it "begins not in a neutrality but in a place of passion within the human soul. Depending on the nature of that passion, our knowledge will follow certain courses and head toward certain ends" (p. 7). Palmer sees truth as troth, a living pledge. "We find truth by pledging our troth, and knowing becomes a reunion of separated beings whose primary bond is not of logic but of love" (p. 32). He illustrates this concept with a story of an early Christian desert father whose students came asking him to speak.

> Some brothers . . . went to see Abba Felix and they begged him to say a word to them. But the old man kept silence. After they had asked for a long time he said to them, "You wish to hear a word?" They said "Yes, abba." The old man said to them, "There are no more words nowadays. When the brothers used to consult the old men and when they did what was said to them, God showed them how to speak. But now, since they ask without doing that which they hear, God has withdrawn the grace of the word from the old men and they do not find anything to say, since there are no longer any who carry their words out." Hearing this, the brothers groaned, saying "Pray for us, abba." (p. 41)

This story illustrates the integrity between knowing and truth, between self and our actions in the world. It allows us to conceive of knowledge as more than a static thing to be defined, but as something integral to how our essence manifests in the world.

Reflecting on this view, I find myself thinking that integrity is central to integral. As Keith says, we "need to practice what we preach" and what we are "preaching" or espousing as the value of integral stages of development is that they can enable us to better serve life. In looking for a marker for this, one could turn to Robert Greenleaf, who coined the term "servant leadership." For him, the test for such leadership was simple; are those served better off than before?

Why do we engage in this voluntary labor of love? Ultimately, it is to enable us to do as Greenleaf asks, to uplift those we serve.

Editorial

IR's Advances

As we welcome you to the sixth semi-annual issue of *Integral Review* (IR), I would like to point to further signs of maturity for IR, some hinted at in the December 2007 issue's editorial, some new. The most important of these is the restructuring of IR. We have moved to a more traditional academic journal structure that builds capacity for taking our work to another level. This has meant that the small group of us who were previously referred to as the editorial board is now listed as associate editors. We thank Christine Harris for her service to IR, dating from its inception in 2004. Her life has taken her in new directions, which have led her to depart her IR editorial role. We wish her all the best in the future!

This restructuring makes our external review process more obvious and transparent. It involved enlisting new faces and competencies, forming a traditional editorial board to serve as the primary pool of peer reviewers. Some of those appointed to this new editorial board have already done reviews for IR, while others were recruited based on their academic qualifications and scope of work. Thus we are happy to formally welcome to the *Integral Review* Editorial Board Rosemarie Anderson, Roland Benedikter, Richard Couto, Mark Edwards, Nancy Glock-Grueneich, Sean Esbjorn-Hargens, Nathan Harter, Carol Hoare, Michael F. Mascolo, Richard McGuigan, Alfonso Montuori, Raymond Reyes, Judy Stevens-Long, and Gregory Wilpert. These appointments officially began in May, when board member names and institutional affiliations were uploaded to IR's website. At a later date, we will augment their listings with more information.

Another sign of maturing for IR was its acceptance in two academic arenas. The first is IR's listing in the Directory of Open Access Journals (DOAJ; http://www.doaj.org/). This service evaluates journals that apply for inclusion in it against a set of access and quality criteria. DOAJ aims to cover all subjects and languages; its directory currently includes 3,401 journals. From its website:

> The aim of the Directory of Open Access Journals is to increase the visibility and ease of use of open access scientific and scholarly journals thereby promoting their increased usage and impact. The Directory aims to be comprehensive and cover all open access scientific and scholarly journals that use a quality control system to guarantee the content. In short a one stop shop for users to Open Access Journals.

In addition to this listing, in spring 2007, *Integral Review* was submitted to the Norwegian Association of Higher Education Institutions for consideration. The NAHEI maintains a list of journals that it determines have met appropriate scientific and academic quality criteria. A review committee oversees the addition of journals to this list. The majority (90%) of journals on this list are on level 1; 10% are allowed to be nominated to be advanced to level 2, which is a more prestigious placement. Journals that do not meet criteria for these two lists are categorized simply as "other." Earlier this year, we received the good news that IR was awarded a place on

SOME RIGHTS RESERVED

the level 1 list of journals. We are pleased to have IR's quality validated by this external review process. These signs of academic acceptance are symptomatic of the growing maturity of IR.

In line with these advances, we also draw your attention to another change, effective this issue. Consistent with our move to more traditional academic structure, we have converted to the volume and issue numbering system. Thus, rather than this current publication being called Issue 6, it is Volume 4, Issue 1.

Earlier this year, we made a technical upgrade to a new platform for IR article forums. This week, we launch the invited forum with author participation on Martin Matuštík's essay on *Towards an Integral Critical Theory of the Present Age*, published in IR Issue 5, December 2007. Another invited forum with author participation will start in the near future: Jennifer Gidley's *The Evolution of Consciousness as a Planetary Imperative: An Integration of Integral Perspectives.* Already going is the open forum on the collective editorial in Issue 5; it is a platform for anyone who is interested to discuss the issues raised by the associate editors in that collective effort. The IR Occasional Newsletter (which you can receive by signing up here – http://integral-review.org/email_issue/index.asp) and this website continue to be the way to stay informed on IR forum activity.

The further fertilization of discourse in the field of integral studies and theory is also getting a boost from John F. Kennedy University and the Integral Institute's first bi-annual integral theory conference – http://www.integraltheoryconference.org/page/page/5594264.htm. This event will see 500 participants, 100 individual presentations, 12 panels and 30 poster presentations gather August 7-10th at JFK University. All of us at IR are very pleased to see a dozen editors, editorial and advisory board members as well as author-contributors from IR presenting at this conference, where a number of us are also participating in panel presentations. IR will host an opening evening reception in the conference hotel, and have an IR information table at the university during the conference. We look forward to meeting more of IR's audience at this event!

On the Contents of Volume 4, Issue 1

We open this issue with Sean Kelly's *Integral Time and the Varieties of Post-Mortem Survival*. This article covers a panoramic scope of philosophical thinking to explore questions of survival after bodily death. Kelly takes a novel path in exploring this topic, focusing on our conceptions of time. He draws from the works of Nietzsche, Barbour, Fechner, Whitehead, Hegel, Jung, Morin, Gebser and Aurobindo to present an alternative view of notions of the soul and reincarnation. In doing this he also models an integral way of thinking and inquiring. This article represents immense possibilities for future dialogue and inquiry on this subject, and we are pleased to open this up with the publication of Kelly's article.

This is followed by Sara Ross' *Using Developmental Theory: When Not to Play Telephone Games*. This article explores some of the challenges that arise from the application and use of developmental theory by non-experts in the field. Pointing to an error in a publication using developmental theory, Ross traces how this error has been passed along in telephone game style, leading to a wide range of ripple effects. She untangles the complex nuances involved in the process of using formal theory in casual fashions, and calls for a response to help facilitate improved usage of developmental theory in the form of an Institute for Applied Developmental Theory.

These two peer reviewed pieces are followed by two interviews. The first is by Markus Molz, who engaged with Jennifer Gidley in *A Transversal Dialogue on Integral Education and Planetary Consciousness*. This fascinating conversation covers a brief summary of Gidley's project of integrating the integrals, an overview of large macro-historical evolutionary patterns in education, the introduction of five—mostly new—terms to integral theory, then explores some of the wide range of approaches to "third wave," postformal education across cultures. They conclude by transcending the conceptual distinctions used for their dialogue, illustrating the power of such dialogues to evolve consciousness.

The second is Russ Volckmann's interview with Steve McIntosh, *An Approach to Integral Consciousness and Politics*. McIntosh's new book, *Integral Consciousness and the Future of Evolution* has been getting a lot of attention since its publication, and Volckmann's interview draws out many interesting aspects of McIntosh's thinking. Beyond exploring some of the usual topics of development and evolution, they also delve into faith, theology and spirituality in relation to the integral framework. There is also a robust exploration of critiques of Wilber's work and the realm of integral politics.

An artistic interlude follows with Andrew Campbell's *Central Fire*. Inspired by his reading of a draft of a submission to IR (that is yet to be published), Andrew invites us into the world of bold and expressive images that his art conveys with brief instructions to engage us in our own explorations of his art.

Andrew Campbell also contributes his art to Sara Ross' *A Lesson to be Writ Large?* This amusing personal story shows how easy it can be for any of us to be taken in by the interpretations we give to our experiences. When perception becomes reality, how do we limit ourselves? Ross' story closes with reflections on what transformations might be possible if we were able to apply the kinds of insights she gained through this humorous experience.

Another question is posed in Jan Inglis' essay *How Then Do We Choose to Live? Facing the Climate Crisis and Seeking "the Meta Response*." Here she examines how our culture is going through marked stages of reaction to climate change similar to how people react to life threatening illnesses. She advocates for using what is known from going through stages of development in crafting a meta response to the issue. Her essay poses a number of thoughtful questions that can aid individuals in their personal reflections as well as guide collective public reflections as we move ever deeper into facing the realities of a changing climate.

Appreciatively Critical Reflections on a Retreat with Adyashanti is a reflective essay by Grady McGonagill (with a foreword by Bill Torbert and art by Andrew Campbell). This piece takes us on a personal journey that engages multiple levels of reflection and learning about Grady's experience at this retreat. With his action-research orientation, he articulates some of the paradoxes, challenges and perceived incongruities of those who take on guru roles in our society.

A similar theme arises in L.D. Gussin’s novel *The Seeker Academy,* which I review. Gussin uses the experiences and narrative of his main character to explore themes, issues and opportunities of the New Age movement. This review describes the basic story line and then the ways in which Gussin manages to deftly portray the intertwined nature of people’s motivations and ideologies for pursuing the kinds of beliefs that are prominent in the New Age movement. It closes with some reflections on why others have been unwilling to review the novel, which relate to the perspectives Gussin reveals.

Then we have a short review by Bonnitta Roy of *Consciousness-in-Action: Toward an Integral Psychology of Liberation and Transformation* by Raul Quiñones Rosado. Roy describes it as a useful and purposeful manual for people interested in social activism, and a wonderful *integrated* personal narrative that expands existing integral models into process versions.

Our final review for this issue comes from Sara Ross. *Integrative oncology: Principles and practice* edited by M. P. Mumber. Ross provides a thorough review and evaluation of this recent scientific text book, the first in the field of integrative oncology. Her chapter by chapter review essentially abstracts the entire text to provide a clear picture of the book’s contents. Ross applies IR’s evaluation criteria to the book, and offers a number of suggestions for areas in which the book or subsequent texts could further advance the stated aims of the field.

With this we close another issue of *Integral Review*. We hope that you will enjoy its contents as much as we have enjoyed working with the authors who created it.

Integral Time and the Varieties of Post-Mortem Survival[1]

Sean M. Kelly

Abstract: While the question of survival of bodily death is usually approached by focusing on the mind/body relation (and often with the idea of the soul as a special kind of substance), this paper explores the issue in the context of our understanding of time. The argument of the paper is woven around the central intuition of time as an "ever-living present." The development of this intuition allows for a more integral or "complex-holistic" theory of time, the soul, and the question of survival. Following the introductory matter, the first section proposes a re-interpretation of Nietzsche's doctrine of eternal recurrence in terms of moments and lives as "eternally occurring." The next section is a treatment of Julian Barbour's neo-Machian model of instants of time as configurations in the n-dimensional phase-space he calls "Platonia." While rejecting his claim to have done away with time, I do find his model suggestive of the idea of moments and lives as eternally occurring. The following section begins with Fechner's visionary ideas of the nature of the soul and its survival of bodily death, with particular attention to the notion of holonic inclusion and the central analogy of the transition from perception to memory. I turn next to Whitehead's equally holonic notions of prehension and the concrescence of actual occasions. From his epochal theory of time and certain ambiguities in his reflections on the "divine antinomies," we are brought to the threshold of a potentially more integral or "complex-holistic" theory of time and survival, which is treated in the last section. This section draws from my earlier work on Hegel, Jung, and Edgar Morin, as well as from key insights of Jean Gebser, for an interpretation of Sri Aurobindo's inspired but cryptic description of the "Supramental Time Vision." This interpretation leads to an alternative understanding of reincarnation—and to the possibility of its reconciliation with the once-only view of life and its corresponding version of immortality—along with the idea of a holonic scale of selves leading from individual personality as we normally experience it, through a kind of angelic self (a reinterpreted "Jivatma"), and ultimately to the Godhead as the Absolute Self. Of greater moment than such a speculative ontology, however, is the integral or complex-holistic way of thinking and imagining that is called for by this kind of inquiry.

Keywords: Aurobindo, Barbour, complex holism, complexity, death, Fechner, Gebser, integral, Morin, Nietzsche, reincarnation, soul, survival, time, Whitehead

---

[1] I would like to thank Michael Murphy and Frank Poletti for inviting me to present these ideas, which have been incubating for a long time, at the Esalen conference on Survival. I am also grateful to Eric Weiss for the many hours, over many years now, of shared deep metaphysical inquiry, and also to Cynthia Morrow, Jorge Ferrer, Robert McDermott, Lisa da Silva-Ward, and to the editors and reviewers of *Integral Review* for their helpful feedback on earlier drafts of this paper.

SOME RIGHTS RESERVED

Introduction

What is it that gives ultimate value to a life? What is it that makes anything in life, and the whole of a life, really matter? If all is impermanence (Heraclitus, Buddhism), if to be is to be finite—a "being-towards-death" (Heidegger)—with, as James puts it, "the great spectre of universal death, the all-encompassing blackness" (2002, p. 139) as the constant back-drop of every hour of life, what difference could it make how well we live our lives? What difference, in short, whether we live in love, wisdom, and beauty, or in their dark but presumably equally transitory counterparts? The natural human, which feels its kinship with the larger cycle of life, is perhaps content with the fact of biological continuity, with the sense of its insertion in an unbroken line of ancestors and descendants, and even with the genetic and biochemical solidarity shared by all forms of life. A more philosophically elevated view is represented by the idea of participation in the Heraclitian or Stoic Logos or the Chinese notion of the Tao. The person of culture, similarly, will find solace in the thought of participating in the history of ideas, will recognize spiritual ancestors in the realms of intellectual, ethical, or esthetic endeavor and will perhaps aspire to their own cultural progeny. The natural and cultural dimensions of the human experience, however, cannot of themselves circumvent the fact that this Earth and all of its life forms, as indeed our sun and the entire physical cosmos within which they are embedded, are finite beings, with beginnings in time, and bound to inevitable death.

Religious or spiritual traditions, of course, have always provided answers to the above questions, answers which are either ignored or denied by the perspectives of a strict naturalism or a restrictive humanism. There is a general consensus among these religious traditions, despite significant differences in other respects, concerning the belief that physical death does not spell the end of the personality or soul. Whether or not it is thought to have pre-existed the birth of the body, the personality or soul is more often than not pictured as surviving its death. It is with the particulars of survival, however, that the significant differences among traditional teachings become apparent. For the traditions of the Indian subcontinent, as for Buddhism, many indigenous traditions, and most religions of antiquity, the soul is believed to reincarnate.[2] In this view, the value of any one life, and the value of any element of a given life, can only be determined through consideration of the series of lives to which the individual life belongs. What you do in this life for good or ill matters because your actions flow from choices made in previous lives and will determine, or at least set the parameters for, choices to be made in future lives. The series of lives is said to be bound together by the law of Karma or its analogue, which, whether or not one believes in a transmigrating soul, provides continuity both before and beyond an individual life, and therefore also gives a ground for its value and meaning.

While some ancient Christians may have believed in reincarnation, the vast majority have, for the better part of two millennia, believed that we are given only one life. Or at least, we are given only one life on Earth—I leave aside the belief in the resurrection of the body—which is to be followed by some form of Eternal Life. The quality of this second Life—in its most dramatic form, whether in Heaven or Hell—is in some way directly linked to the manner in which one lives the first, and only, earthly life. The value or meaning of this life, therefore, as of any significant action or experience within it, rests in the fact that it is of potentially eternal consequence. What happens now, though itself transitory, is an opening to the everlasting.

---

[2] I will not always repeat "soul or personality," though I am aware of the problems associated with the term soul in connection with Buddhist traditions in particular.

These two views of life and survival—the traditional reincarnationist and the once-only with its afterlife—appear to be highly incompatible, and I have yet to encounter any attempt to reconcile them. The bulk of the relevant literature is devoted to arguing the case for one or the other of the standard views (for a compelling philosophical argument in favor of reincarnation, see Aurobindo, 1991; for a Christian-based refutation of reincarnation, see Valea, 2007). Ervin Laszlo (2004) has expanded upon Rupert Sheldrake's theory of morphic resonance (of which I will have more to say below), arguing against reincarnation but for the reality of past-life recall. Christopher Bache's understanding of the soul as "higher form of individuality" that "integrates many lifetimes, many 'persons' into a meta-personal consciousness" (2006, p. 125), while not explicitly concerned with the kind of reconciliation I am envisioning, is friendly to my proposal. Peter Novak's (1997, 2003) "division theory" claims to reconcile reincarnation with the Christian belief in Heaven and Hell, but not the traditionally opposed views of one life versus many (and in any case, his "reconciliation" comes at the cost of the postulation of two autonomous souls, only one of which reincarnates; as his theory suggests, the reconciliation is predicated on a "division"). It is of course possible that one, or both, are mistaken. In what follows, I suggest that both views are true in essential respects, but that to see them as such demands a more integral view of time than the one, or ones, normally associated with either view of survival. To articulate such an integral view is, to say the least, very challenging. "It is impossible," as Whitehead (1920, p. 73) reminds us, "to meditate on time and the mystery of the passage of nature without an overwhelming emotion at the limitations of human intelligence." I will, accordingly, proceed in what might appear as a somewhat indirect or circumambulatory manner, hoping that, by the time I come to the last section that deals explicitly with a more integral or complex view, what will begin as an indeterminate—though to me, at least, compelling—intuition will have taken on a more palpable and communicable form. While the intuition in question—namely, that of time as an *ever-living present*, and of moments and lives as *eternally occurring*—is grounded in my own experience and many years of contemplative inquiry, instead of jumping immediately to my suggestions for a possible reconciliation of both views of survival, I approach the problem by first considering some positions on the nature of time (Nietzsche, Barbour, Whitehead) and the afterlife (Fechner) which offer fruitful if partial approaches to the core intuition. The more explicitly integral and complex view that I explore in the final section draws from close readings of Aurobindo, Gebser, Jung, Morin, and to a lesser extent, Wilber, all of whom advocate and (at least attempt) to enact various forms of postformal thinking which not only recognize the limits of the principle of contradiction, but remain open to the promptings of intuition and the value of metaphor.

From Eternal Recurrence to the Eternally Occurring

Discussions of the possibility or nature of survival often focus on the question of whether a different (subtler) kind of substance or body survives the decay of the physical body, or on the question of "where" the soul or personality goes after death. These are important considerations. What is generally not recognized, however, is that to think of survival in terms of place or extended substance, however subtle, is to appeal to only one of two complementary forms of intuition—the spatial—at the expense of the temporal. Without denying the truth or fruitfulness of approaching the matter from the side of our spatial intuition, it seems to me that an integral view of survival would include a full consideration of the temporal intuition as well. From a philosophical, and specifically Kantian, point of view, the temporal intuition is germane to the internal sense or the experience of consciousness—and therefore to notions of soul and personality—whereas the spatial intuition is associated with the experience of an external world, and therefore also of matter or extended substance.[3] So while the spatial intuition is certainly appropriate and even necessary in any talk of subtle "bodies," the experience of self-consciousness, of personality or soul, can only be approached or described spatially from the outside, as it were. To approach the question of the soul and survival directly and from the inside, therefore, is to grapple with the mystery of time.

And so I begin with Nietzsche, whose theory of eternal recurrence he considered the central insight of his life's work, and indeed of the age that he helped to inaugurate. Though his relationship to Christianity is complex, there is no doubt that Nietzsche rejected the traditional Christian view of personal immortality, which he saw as arising out of a hatred of, and revulsion from, life. The belief in any form of after-life was to him an expression of anti-life, a flight from nature and becoming to a lying fantasy of individual imperishability. Having absorbed the full impact of the modern project of disenchantment that began (however unintentionally) with Copernicus, Nietzsche was compelled to reject the possibility of any kind of transcendent "beyond." What, then, could constitute the ground of value? What is capable of granting meaning and value to our individual endeavors and to life as a whole? His answer was: Life or the cosmos itself—beyond which is nothing—in the form of self-conscious and therefore liberated Will-to-Power.

Earlier in the century, Schopenhauer (1966) had articulated his vision of an infinite though blind and unconscious Will as the ontological ground of reality—a vision in keeping both with the darker side of the later Romantic movement and with a certain reading of Buddhism. The suffering caused by the impossibility of satisfying the Will's boundless craving could only be countered, according to Schopenhauer, through a systematic negation of the Will in the form of a sublimation of the life-impulse (particularly, through esthetic contemplation). This vision was transformative for Nietzsche. He soon rejected Schopenhauer's pessimism, however. And while he retained the centrality of the Will, he came to see the life-impulse—with which, for Schopenhauer, the Will was more or less identified—as itself a manifestation of the Will-to-

---

[3] Kant's understanding of the inner sense and its relation to time, though influential in the subsequent history of philosophy, is anything but crystal clear. The key statements from the *Critique of Pure Reason* are as follows: "By means of outer sense, a property of our mind, we represent to ourselves objects as outside us, and all without exception in space" (1929, p. 67). "Inner sense, by means of which the mind intuits itself or its inner state, yields indeed no intuition of the soul itself as an object; but there is nevertheless a determinate form [namely, time] in which alone the intuition of inner states is possible, and everything which belongs to inner determinations is therefore represented in relations of time. Time cannot be outwardly intuited, any more than space can be intuited as something in us" (p. 67). As I understand it, the basic idea seems to be that, *experience as such*—"the mind [which] intuits itself or its inner state"—necessarily involves the fact of *succession* (what James will later call the "stream of consciousness"), and so the form of time. There is also, to my mind, the mysterious role of the *will* which Schopenhauer (1966), in his revisioning of Kant, considered the true *noumenon* and which, as I suggest later in this paper, might play a crucial part in the manifestation of time.

Power, that is, the drive of every being to extend or magnify its proper domain or sphere of influence. According to Nietzsche, this drive is as manifest in the life-affirming worldview of classical paganism as in the life-denying spirit of late-antiquity and historical Christianity. Ignorance of the nature of life—and indeed, of all human striving, however idealistic or spiritual—as an expression of the Will-to-Power constitutes a form of bondage. The bondage is doubly oppressive in the case of the world-deniers, whose illusory "beyond" serves not only, as Marx would put it, as the opium of the people, but as a vampiristic drain on life's nobler impulses and possibilities for authentic happiness.

By contrast, the liberated, because self-conscious, Will is portrayed as manifesting an unconditional blessing or affirmation of life, of what was, is, and shall be—an unqualified and joyfully uttered "Yes!" to the whole causal nexus, the entire sequence of moments within which the present is embedded. This blessing is a radically free act, which at the same time is yoked to an awareness of a universal and inexorable fatalism (a yoking which Nietzsche expresses with the phrase, *amor fati*, the love of fate). That this awareness does not lead to a sense of oppression or despair, but instead is, or can be, accompanied by a boundless joy, is the result of his insight into the nature of time as eternal recurrence, an insight which he nevertheless characterizes as "*The greatest weight*."

> What, if some day or night a demon were to steal after you into your loneliest loneliness and say to you: "This life as you now live it and have lived it, you will have to live once more and innumerable times more; and there will be nothing new in it, but every pain and every joy and every thought and sigh and everything unutterably small or great in your life will have to return to you, all in the same succession and sequence--even this spider and this moonlight between the trees, and even this moment and I myself. The eternal hourglass of existence is turned upside down again and again, and you with it, speck of dust!" Would you not throw yourself down and gnash your teeth and curse the demon who spoke thus? Or have you once experienced a tremendous moment when you would have answered him: "You are a god and never have I heard anything more divine." If this thought gained possession of you, it would change you as you are or perhaps crush you. (Nietzsche, 1974, p. 273)

The more general idea of recurrence is of course ancient and wide-spread (see Cairns, 1962), beginning with what might be described as a naturalistic cyclism (e.g., most indigenous cultures, ancient Taoism) inspired by the repeating pattern of the seasons and the periodicity of the sun, moon, and stars. Next, and presupposing the latter, there is an ideal-formal cyclism (Plato, Aristotle, Shankara) which sees the natural or cosmic cycles as embodiments of subtler archetypal patterns. Then there is the stronger form of the belief in eternal recurrence, which involves not only seasonal patterns or ideal types, but every last detail of the cycle of becoming. This strong view of recurrence, which Nietzsche adopted, is in fact very close to that of the ancient Pythagoreans, Stoics, and Epicureans, and especially the latter two, since they too were materialists.[4] Though I suspect there are unknown sources in Nietzsche's own immediate experience, a feeling for which we can glean from the passage above, he also articulated a version of the Epicurean argument based on the assumption of a finite set of possible material or formal combinations in a temporally infinite universe.

---

[4] According to Nemenius, the Stoics believed that "in stated periods of time a conflagration (*ekpyrosis*) and destruction of things will be accomplished, and once more there will be a restitution of the cosmos as it was in the very beginning. And when the stars move in the same way as before, each thing which occurred in the previous period will without variation be brought to pass again. For again there will exist

> If the world may be thought of as a certain definite quantity of force and as a certain definite number of centers of force--and every other representation remains indefinite and therefore useless--it follows that, in the great dice game of existence, it must pass through a calculable number of combinations. In infinite time, every possible combination would at some time or another be realized; more: it would be realized an infinite number of times. And since between every combination and its next recurrence all other possible combinations would have to take place, and each of these combinations conditions the entire sequence of combinations in the same series, a circular movement of absolutely identical series is thus demonstrated: the world as a circular movement that has already repeated itself infinitely often and plays its game ad infinitum. (Nietzsche, 1968, p. 549)

No one, of course, is swayed by such an argument who is not already predisposed to the worldview it is meant to prove. I, for one, do not find it convincing, though I do find it sometimes compelling and can appreciate the elegance of its logical structure. And while my rejection of eternal recurrence, at least as formulated by Nietzsche, is doubtless grounded in infra-rational, and perhaps also supra-rational, promptings, I also object to the doctrine on logical and phenomenological grounds. Phenomenologically, if each life, each moment, and ultimately the entire history of the cosmos, is one instance of an infinite series of (factually or ontologically) identical instances, then the *experience* of each instance would also be identical. There would be no way, empirically speaking, of telling one apart from any other in the series. Logically, according to Leibniz's Law or the principle of the identity of indiscernibles, we are driven to the conclusion that, in fact, there can only be one of each given instance, whether a moment, a life, or the history of the cosmos as a whole. Still, there is something behind Nietzsche's insight, something in the quality of the experience as the demon whispers in his ear with the moonlight between the trees, that resists the application of Leibniz's Law. It is the sense that, though he could not believe in a redeeming afterlife, nothing of value in *this* life is ever lost—for, as Nietzsche's (1969, p. 333) Zarathustra proclaims, "all joy wants eternity —/ Wants deep, wants deep eternity." The moment, however, must not only be simply preserved in the manner of a dried flower or even a particularly vivid memory, but must somehow sur-*vive*, blessed as it flies, in Eternity's sunrise.[5]

The best illustration I can think of at this point to express what I am trying to get at comes from a dream I used to have periodically. I would discover a secret room in my family's house, filled with all kinds of objects from my childhood. Among these was a stack of the most amazing kind of photographs. Seen from the corner of the eye, as it were, nothing seemed out of the ordinary, but as soon as I focused my attention on one, the scene would come to life. I remember

---

Socrates and Plato and every man, with the same friends and fellow citizens, and he will suffer the same fate and will meet with the same experiences and undertake the same deeds…And there will be a complete restoration of the whole, not only once but many times, or rather interminably, and the same things will be restored without end." (Nemenius, as quoted in Cairns, 1962, pp, 220-221)

[5] Blake's lines in "Eternity" run: "He who binds himself to a joy/Does the winged life destroy:/But he who kisses the joy as it flies/Lives in eternity's sunrise" (1988, p. 56).

one in particular, where I am splashing happily in the shallow, sun-sparkled water at the lake where we used to spend our summer vacation. It is perhaps a five to ten second scene, almost like a video clip. As long as you attend to it, it is “playing.” Not in the manner of a loop tape, however—and here the analogy breaks down—since nothing in the scene is repeated. Not the eternal recurrence of the same, in other words, but the scene as somehow eternally occurring.

Journey to Platonia

Despite Nietzsche’s prominent role in initiating the post-modern turn, his cosmology retains a more or less Newtonian view of space and time, in the sense that they are conceived of distinctly as infinite container and continuous forward flow, respectively (the circular character of the eternal return involves the patterns or configurations of matter rather than the temporal flow itself). All of this changes with the new physics. The dominant tendency, with respect to time, has been to consider it in some fundamental sense an illusion, “even if a stubborn one,” as Einstein said (referring to the distinction between past, present, and future). “Since Einstein,” Paul Davies notes, “physicists have generally rejected the notion that events ‘happen,’ as opposed to merely *exist* in the four-dimensional spacetime continuum” (1995, p. 253). The germs of this tendency are actually already hidden in Newton, Descartes, and Galileo with the formal geometrification of nature and has its roots in the Parmenidian/Pythagorean/Platonic stream of the Western philosophical tradition and its preoccupation with the geometrical and mathematical ideals of stasis and symmetry.

Julian Barbour has recently produced a fascinating and substantial argument for the dominant post-Einsteinian view—or perhaps, more accurately, for an original direction that is consistent with this view—in his book, The *End of Time: The Next Revolution in Physics*. At the core of the argument is an extension of Machian mechanics, which is to say, a vision which does away with space and time as the “ultimate arena” of matter and instead conceives of motion and inertia purely in terms of differences between relative configurations of the totality of objects which constitute the universe. To get at the essence of this vision, Barbour asks:

> What is the reality of the universe? It is that in any instant the objects in it have some relative arrangement. If just three objects exist, they form a triangle. In one instant the universe forms one triangle, in a different instant another. What is to be gained by supposing that either triangle is placed in invisible space? The proper way to think about motion is that the universe as a whole moves from one “place” to another “place,” where “place” means a relative arrangement, or configuration, of the complete universe. (Barbour, 1999, p. 69)

Much of the book is devoted to demonstrating the compatibility of Relativity and Quantum Mechanics with Mach’s vision. I will not attempt to rehearse the main steps of the argument, which are not only challenging in their details but include original interpretations of many standard and some highly speculative episodes in the history of physics (from Newton’s bucket experiment around the principle of inertia to the stationary Schrödinger and Wheeler-De-Witt equations).

Barbour's main contribution to the Machian project is the formulation of his concept of "Platonia," which is conceived of as an n-dimensional phase-space, "each point of which corresponds to one relative configuration of all the particles in the Newtonian arena" (Barbour, 1999, p. 273). The invocation of Plato indicates that the phase-space, or configuration space, as Barbour prefers to call it, is to be conceived ontologically on the analogy of the realm of eternal and unchanging Forms or Ideas.[6] Platonia is "the collection of all possible Nows" (p. 177), the totality of instants of what we call time. Despite the use of "Now" and "instants," however, Barbour maintains that time as such does not exist. "[*I*]*nstant of time*," he writes, "simply means configuration of the universe" (p. 266).

Barbour's is perhaps the most sophisticated defense of the "block universe" theory of time, where "[e]verything—past, present, and future—is there at once" (p. 143). To do full justice to his argument, I would have to say something about his ingenious theory of "records" or "time capsules," by which he accounts for our experience of the past and of apparent histories, but I must leave this to interested readers to pursue on their own. For my part, while I am very sympathetic not only to much of the reasoning presented, but also to what I take to be the experiential and motivational backdrop to the theory—which I will turn to in a moment—I think at the very least that Barbour has overstated the case, if he is not simply wrong, in asserting the "end" or non-existence of time. It is one thing to demonstrate the formal possibility of an essentially geometric (and therefore already spatialized) model of both motion and the phenomenon of histories in a way that reduces the experience and reality of time to points in configuration space (however high or complex the dimensionality). But to say that, in his model, time is simply "reduced to *change*" (p. 70, my emphasis), merely begs the question of time. The experience or phenomenon of *passage* between instants indeed involves the concept of change (as do *lived* histories), but change itself presupposes the reality of time. Even if one wants to avoid the notion of motion, change in configuration is impossible without some form of *dynamic* principle that selects the new instants, frames the group, or traces the path or trajectory through Platonia. There is *choice* or *agency* involved, in other words, which effects the transition between configurations.

What is this dynamic principle behind change, motion, passage, transition, and therefore time? It is, I would maintain, the *Will,* or something closely analogous to what we experience and call by that name. I am not thereby necessarily endorsing Nietzsche's version of the Will-to-Power, but perhaps we can speak of a *Will-to-Time* that blows across the topography of Platonia. While the block universe—insofar as it draws from platonic idealism—can be considered antithetical to Nietzsche's positive valuation of life and becoming, Barbour at least seems to share key elements of Nietzsche's outlook. "I also feel strongly," he writes, "that *this* created world is something to be marveled at and cherished, not dismissed as some second-best version of what is yet to come" (p. 327). Barbour's Platonia is after all a physics of *this* world, the whole point of which is not to lift us into a contemplation of immaterial forms, but to help us see how the fleeting world of appearance, which for the traditional Platonist is insubstantial and in a sense unreal, is in fact eternally abiding.[7] Though, in my opinion, unable to account for the experience of time as *lived*, Barbour does offer an approach to the same kind of insight that we have seen lies at the heart of Nietzsche's vision—namely, that the now which passes in some sense lives on, as does the now which, from any given perspective, has yet to be. Instead of the (complexified) block universe of Platonia, we are brought once again to the idea of the world as eternally occurring.

---

[6] Surprisingly (if I am not myself mistaken), Barbour misreads, and inverts, the famous analogy of the cave, placing the Idea-sensitive mathematician in the cave contemplating the projected images on the cave wall instead of in the clear light of day above-ground.

Holonic Survival

"The desire for an afterlife," Barbour writes in his concluding pages, "is very understandable, but we may be looking for it in the wrong place" (p. 331). Perhaps—or at least we may need to look with different eyes, ones that are sensitive to the subtle hues and fine shades of the afterlife. So far, my readings of Nietzsche and Barbour have yielded the possibility of the survival of a life—and each of its constitutive moments or instants—that does not necessarily involve the common idea of the persistence of the soul or personality beyond the death of the body. In this section I will turn to the more common idea, drawing on the insights of Fechner and Whitehead—two great souls whose theories have much to offer towards what might be called an organic or holonic theory of survival.

Though rightfully recognized as one of the founders of experimental psychology, Fechner (1906, 1946) was also one of the great philosophers of nature (*Naturphilosophen*) in the tradition of Schelling and Oken. What is also generally ignored in the textbooks is the degree to which Fechner's life-work centered on the transpersonal nature of the soul and its likely post-mortem fate. According to Fechner, everything that lives has a within, an inner radiance of consciousness or soul. The soul, or psyche, is in fact nature seen from within, just as nature is soul seen from without. This is the fundamental insight behind Fechner's theory of psychophysical parallelism. On the analogy of the human being, whose consciousness or soul is associated with a body manifesting a certain level of organizational complexity, Fechner reasons that the living Earth, which is equally if not more complexly organized than the human body, must also possess its corresponding consciousness or soul—the *anima mundi* of the ancients and the philosophers of nature.[8] Blindness to the *anima mundi* is result of what Blake called "single vision and Newton's sleep," or of the dominance of what Fechner referred to as the "night-time view" of the world.

---

[7] We see here the effect of the intervening two millennia of western cultural history and the evolution of consciousness, and especially the last five hundred years. The central symbol of the Incarnation which guided the western religious imagination, followed by the modern process of secularization (itself in many ways an organic expression of the symbolic world it was to negate), both involved a radical revaluation of the cosmos (and especially this "sublunary" realm of becoming) in a direction in many ways antithetical to the otherworldly orientation of Platonism, which, in other respects, has come to dominate the spirit of modern physics.

[8] In his *Zend-Avesta*, Fechner (1906) reasons to the World Soul as follows: "Examining the various points of resemblance as well as of difference between man and earth, we discover on the one hand an agreement between them in every point which in any theory of the relation between body and soul has been established as characteristic of a spiritual individuality connected with a material organism, whereas their undeniable differences make it evident that the earth is an individuality of higher and more independent life than man's lower and more restrained life" (p. 16).

A master of what was known by the Romantics and idealists as “intellectual intuition” or what, more recently, David Bohm has called “intuitive reason” (Bohm & Kelly, 1990; Bohm & Peat, 1987), Fechner explores a series of finely drawn analogies, moving from the bottom up, from the microcosm to the macrocosm, which facilitate a deepening apprehension of the within of things, from the souls of plants to the *anima mundi* and the Divine Mind, or rather Personality, whose body is the cosmos itself. In so doing, he initiates us into the “daylight view,” which is to say a way of “seeing” the inherent luminosity or self-radiance of being which we are, and which surrounds and permeates us. This world soul, at least as far as our earthly life is concerned, constitutes at once the psychic ecosystem of all living souls, and also in some sense a relatively autonomous personality in its own right, with its own memory and biography, its subpersonalities or complexes. At the same time, the world soul is itself a distinct member of the community of souls which together constitute the soul of the cosmos or the mind of God.[9]

Fechner believed that, after the death of the body, the soul wakens to its participation in the life of the world soul. His central analogy for the passage from life to afterlife is the transition from perception to memory or reminiscence. My favorite method of witnessing the peculiar character of this transition involves ringing a bell or bowl, with a single stroke, and tracking the experience of the sounding tone or tones until the very moment one is conscious of not hearing any more of the original sound. Immediately—and by this I mean, without a discernible interval—there is the memory of the sound. I find this lack of distinct border between the two experiences or occasions fascinating to experience, particularly in the context of a sustained meditation on the nature of time and its relation to experience or consciousness, to the continuity of personal identity, and of course the question of survival. In this context, pursuing the analogy, Fechner writes:

> When then my eyes are closed in death, and my sensible life of perception is extinct, may there not awake instead of it a life of memory in the higher Spirit? And if through me during my life of sense-perception that Spirit saw clearly and vividly…what is there and in precisely the way it presents itself, will not now the memory of everything that was comprised in the duration of the moment of perception…begin independently to live and stir, and to get into relationship and communication with the circle of memories which the greater Spirit has gained by the death of other men? But just as truly as my life of sense-perception was that of a being sensible of independence and of separateness within that Spirit, just so truly must this be the case with my life of memory [and therefore with personal consciousness in the afterlife]. (Fechner, 1946, p. 256)

As Fechner sees it, therefore, the individual soul survives the death of the body in the form of a continuing experience of personal identity which, without losing its specific individuality, nevertheless finds itself in a more “clear and conscious” (Fechner, 1906, p.18) relation to the “divine spirit” of the cosmos. Similarly, and again on the analogy of the relative gain in imaginative freedom in the passage from perception to memory or recollection, the “means of our mutual intercourse” as awakened soul-beings increase “in intimacy, variety and consciousness” (Fechner, 1946, p. 20).

---

[9] Fechner imagines that, intermediary between the world souls and the mind of God, are the souls of the various solar systems. Presumably, had he the benefit of our telescopes, he would have added the galaxies to the scale of cosmic beings.

Though some theologians might question his inclusion of the individual soul within the world soul, Fechner's vision of survival—and I have presented only a kind of line drawing as compared to the richly painted canvas of his many texts dealing with the matter—is consistent with the traditional Christian view of both the uniqueness ("once only") of the terrestrial life and of the persistence and immortality of personal identity. This vision of survival relies heavily on a fine use of the *spatial* intuition, in the first place with the theory of psychophysical parallelism, where the psyche is characterized as the "within" and the physical as the "without;" and secondly with the idea of organic or holonic *inclusion* (the notion of systems within systems, as with the relation of cells < tissues < organs < bodies < ecosystems), made parallel to the *temporal* relation of this life to the *after*-life by means, as we have seen, of the central analogy of the transition from perception to memory. The time factor enters the picture here with the experience of *transition*, as also in Fechner's characterization of death as a second birth (that is to say, as a *passage* to a new and higher life).

Anyone familiar with Whitehead's philosophy of organism will have no trouble in seeing its profound affinity with Fechner's vision. In contrast with the latter, however, which relies so heavily on the spatial intuition, Whitehead focuses on the nature and, as he sees it, the pervasive reality, of process. Correlatively, while Fechner's cosmos—despite its thoroughgoing organicism in other respects—is still more or less Newtonian in its view of time (which, independently of matter, "flows equably without relation to anything external" [Newton, 1846, p. 77]), Whitehead's view of both space and time are fully consistent with the cosmology of the new physics. These contrasts have profound, if decidedly complex and by no means unambiguous, implications for our understanding of survival.

If I could only present a poor sketch of Fechner's vision, my rendering of Whitehead's insights, couched as they are in such challenging language and dealing with the most abstruse of scientific and philosophical preoccupations, must be considered as a kind of hurried silhouette, though hopefully one that captures the likeness. "One all-pervasive fact," writes Whitehead, "inherent in the very character of what is real is the transition of things, the passage one to another" (1969, p. 93). This fact is highlighted by the idea of nature or reality as *process* (hence the reference to Whitehead's system as "process philosophy"), and is consistent with the dominance, beginning with and continuing throughout the modern period, of the experience of change, whether in the form of social or political revolutions, the ideology of progress, the theory of evolution, or scientific and technological advance. In keeping with this experience, Whitehead characterizes the nature of reality as consisting not of things, stuff, or abiding substance, but rather of "actual *occasions*" or "*events*." From the point of view of more recent science, matter, he notes, "has been identified with energy, and energy is sheer activity; the passive substratum composed of self-identical enduring bits of matter has been abandoned, so far as concerns any fundamental description" (Whitehead, as quoted in Datta, 1961, p. 429). In a direct challenge to the Cartesian dualism, actual occasions are said to emerge through and as a process of "prehension" and "feeling," which not only grants an irreducible subjectivity or interiority to the world's constitutive elements, but points as well to the essential fact of *relationship* in the definition of these elements. Equally challenged is the Newtonian view of "simple location,"[10] since the pervasiveness of process prohibits the setting of fixed boundaries between occasions or events. This fact is only amplified, of course, when Relativity and quantum non-locality are brought into the picture. "In a certain sense," Whitehead therefore feels free to say, "everything is everywhere at all times. For every location involves an aspect of itself in every other location. Thus every spatio-temporal standpoint mirrors the world" (p. 91). Here we have a particularly vivid expression of the organic or holonic (or holographic) quality of Whitehead's vision—which explains why, along with "process philosophy," it is referred to as the philosophy of *organism*.

---

[10] "To say that a bit of matter has *simple location,*" writes Whitehead (1969, p. 58), "means that, in expressing its spatio-temporal relations, it is adequate to state that it is where it is, in a definite finite

The organic or holonic quality expressed in the above quotation appeals primarily to the spatial intuition (with the words "everywhere," "location", and "standpoint"), despite the reference to "times" at the beginning and to "spatio-*temporal*" at the end. The same quality, however, is evident through a more direct—though, as we shall see, somewhat paradoxical—appeal to the temporal intuition with Whitehead's notion of the "satisfaction" of an actual occasion and its passage into the state of "objective immortality." "The final phase in ... constituting an actual entity," writes Whitehead," is one complex, fully determinate feeling. This final phase is termed the 'satisfaction'" (Whitehead, 1978, p. 48). The entity or occasion "terminates its becoming in one complex feeling involving a completely determinate *bond with every item in the universe*, the bond being either a positive or a negative prehension" (p.44, my emphasis).

What is described here from the point of view of the actual occasion as a culminating "complex feeling" can also be understood as "the attainment [which] halts its process, so that by transcendence it passes into its objective immortality as a new objective condition added to the riches of definiteness attainable, the 'real potentiality' of the universe" (Whitehead, 1978, p. 223).

I am reminded here of Fechner's analogy of the transition from perception to memory, though of course Fechner has in mind the immortality of the soul or personality (and not an elementary occasion), and envisions a subjective rather than an "objective" immortality.

I said above that Whitehead's appeal to the temporal intuition is paradoxical because the concepts of an actual occasion's "satisfaction" and "objective immortality" involve the "*termination* of becoming" and the "*halting* of process." The difficulty here has to do with the fact that any talk of "termination" or "halting" presupposes a backdrop of time—or, which comes to the same thing, a perception of continuous motion as measured against a stationary and extended background. Although Sherburne, who speaks authoritatively for Whitehead, speaks of a "succession of phases" in the "genetic process" or "concrescence" of an actual occasion, he claims that concrescence[11] itself "is not in time; rather, time is in concrescence in the sense of being an abstraction from actual entities" (Sherburne, 1966, p. 36). I cannot claim to resolve these seeming paradoxes, and in this respect I am no further along than Augustine, who was the

---

region of space, and through a definite finite duration of time, apart from any essential reference of the relations of that bit of matter to other regions of space and to other durations of time."

[11] Concrescence "is the name given to the process that *is* any given actual entity; it is 'the real internal constitution of a particular existent'…. Concrescence is the *growing together* of a many into the unity of a one" (Sherburne, 1966, p. 212).

first to point them out.[12] Though perhaps irresolvable, however, they are nevertheless potentially generative of a higher or more complex kind of insight, the nature of which we shall consider in more detail in the next section.

The idea that time is "in" actual occasions rather than the reverse is an expression of the "epochal" theory of time. In this theory, time is said to be structured or generated by the configurations of actual occasions as "drops of experience," which, though themselves the "atoms" of time, also have "duration."[13] These temporal occasions can be arbitrarily divided according to various abstract metrics, though not without destroying the concrete depth and texture of the occasion's duration (and hence its subjective immediacy or experiential integrity). One can imagine such occasions as subsumed in more complex temporal occasions (or "events")—for instance, this moment as I hold the thought while typing this sentence is integral to the period I spend at the computer working on this particular section of the paper. Since this period, however, though distinguishable as a kind of gestalt from what came before it and what is to follow, is nevertheless continuous with the same, the division into higher-order temporal occasions is somewhat arbitrary. *As I see it, perhaps the only natural boundary one encounters in the scale of temporal occasions, apart from the proposed atomistic "drops," is a completed life.* The point I want to make, however, is that the drops of experience, as atoms of time, are not, as we have seen, themselves "in" time. Their duration is qualitative and not subject to the same kind of metrical mapping (by coordinate grids) as is possible in the comparison *between* occasions. By the same token, a complete(d) life, as a complex or higher-order temporal occasion, is also not "in" time, which doesn't mean that, from the perspective of the life as in-complete, time does not flow. What this does mean is that, appearances to the contrary, there is a sense in which, or a (meta-) perspective from which, a life is both complete and fully present (not merely passed or yet to be), along with all of its constitutive moments or "drops" of experience.

Such a meta-perspective, of course, can only be that of God (by any other name). That Whitehead's position suggests what Hartshorne (1951, p. 543) describes as "the unfading everlastingness of all occasions in God" is supported by Whitehead's claim that "[e]ach actuality in the temporal world has its reception into God's nature. The corresponding element in God's nature is not temporal actuality, but is the transmutation of that temporal actuality into a living, ever-present fact (Whitehead, 1978, p. 350)." Questions remain, however. There is no consensus among process theologians as to whether or not this immortality or "everlastingness" involves the persistence, in the form of the continuing experience, of personal identity—what is normally understood by the term “soul”—or merely the essence, everything “that can be saved” (Whitehead, 1978, p. 346), of the world’s becoming or “fluency,” as Whitehead calls it.[14] An intermediary position, the gist of which we have already seen with my reading of Nietzsche’s eternal return and with Barbour’s notion of Platonia, would be that what to us are past occasions—including, for instance, your subjective experience of waking up this morning or of greeting your neighbor in the street, with all of its phenomenological particularities—remain as vivid and livingly present, or eternally occurring, actualities for God. According to Bergson, we ourselves could, in principle, experience what this might be like. As Richard Field points out in his paper on “William James and the Epochal Theory of Time:”

---

[12] See Augustine's unparalleled (in insight and beauty) treatment of time in Book XI of the *Confessions* (1979) where, along with the idea of that the past and the future (as memory and anticipation) exist only as inflections of the present, he treats of the paradox of time as, on the one hand, the present or the now which is discrete and not extended (*spatium*), and on the other, the association of time with measurement (longer and shorter, before and after) which implies continuity and extension.

[13] This is the idea of the "specious present," most notably associated with James, which argues against the identification of the experienced present with the non-extended or one-dimensional "instant." James's understanding of the matter was influential in Bergson's idea of "duration" and Whitehead's idea of actual entities as "drops of experience" and "atoms of time." On the specious present, see Robert de Poidevin's article in the *Stanford Encyclopedia of Philosophy*, @ http://plato.stanford.edu/entries/time-experience/ (3/6/04).

> It is not … inconceivable, according to Bergson, for the whole of a person’s past to be thrust into the immediate awareness of the present…. for Bergson attention is directed by interest. Remove practical interest, and it becomes quite possible that our normal distinction between the past and present would cease to be a psychic fact. If such an eventuality actually took place, experience "would . . . include in an undivided present the entire past history of the conscious person, not as instantaneity, not like a cluster of simultaneous parts, but as something continually present which would also be something continually moving." (Field, 1983, pp. 260-274)[15]

Also at issue is the question of the future, and more generally, of the ultimate significance of time from the point of view of God or the Divine. According to Kraus in her *Metaphysics of Experience, A Companion to Whitehead’s Process and Reality*, not only is it the case that, “from the divine vantage point, the endless fruitions of the creativity are simultaneously co-present in the immediacies of their self-creative activities,” but the divine concrescence is always already in some sense “complete insofar as past and future are not relevant terms….” Again: “From the divine perspective, time becomes space in the sense that all ‘times’ are co-present in divine feelings….” At the same time, however, Kraus also recognizes that “God’s physical feeling” is “incomplete, in that the future from any perspective is not yet actual and is perpetually actualizing itself” (Kraus, as cited in Edwards, 1981, pp. 30-34). Edwards, for one, strenuously objects to what he describes as Kraus’s Boethian and Thomistic reading of Whitehead. “The view that the future is incomplete and indeterminate only from our finite perspective,” he writes, “whereas it is complete and determinate from the divine perspective is just the view which process theology rejects rather than affirms, though there may be more than one way of developing an alternative metaphysic available to process thinkers" (Edwards, 1981, pp. 30-34).

---

[14] Whitehead seems to have left the matter open, through lack of both compelling evidence, on the one hand, and of a sufficiently coherent theory, on the other. In *Religion in the Making* he notes: “Also at present it is generally held that a purely spiritual being is necessarily immortal. The doctrine here developed gives no warrant for such a belief. It is entirely neutral on the question of immortality, or on the existence of purely spiritual beings other than God. There is no reason why such a question should not be decided on more special evidence, religious or otherwise, provided that it is trustworthy. In this lecture we are merely considering evidence with a certain breadth of extension throughout mankind. Until that evidence has yielded its systematic theory, special evidence is indefinitely weakened in its effect.” Retrieved February 29, 2004 from http://website.lineone.net/~newthought/ritm1.htm

[15] Two realms of contemporary research provide analogues to Bergson’s imagined scenario: the experience of the “life-review” in Near-Death-Experiences (NDEs), and a certain class of non-ordinary experience (potentially present, for instance, in psychedelic work or other, non-drug, engagements of the deep psyche or “mind-at-large”) which could be characterized as transpersonal, in that it involves the transcendence of the temporal constraints that help to define the personal ego in its ordinary state of consciousness (see Grof, 1988).

I would like to consider such a metaphysical alternative in the following section. To conclude this one, however, I will simply say that my own metaphysical musings have led me to side more with Kraus than with Edwards as far as the above seeming paradox is concerned. For, as Whitehead puts it: "All the opposites are elements in the nature of things, and are incorrigibly there. The concept of 'God' is the way in which we understand this incredible fact—that what cannot be, yet is" (Whitehead, 1978, p. 350).

An Integral or Complex-Holistic View

The metaphysical alternative that I will focus on in this last section is based largely on the philosophies of Sri Aurobindo and Hegel, though I will draw as well from the work of Jean Gebser and Edgar Morin when I turn to more specifically epistemological considerations. So far, with the possible exception of Fechner, the theoretical schemes we have entertained have brought us to the threshold, without fully crossing over, of what I would consider an integral view of survival—a view, that is, which is capable of accommodating, through the consistent application of a single generative principle, apparently mutually exclusive views (including in particular the mainstream Christian, or "once-only" view, and the idea of reincarnation). The articulation of such a view, I have suggested, must involve a correspondingly integral view of time. Aurobindo and Gebser, as we shall see, each have very suggestive things to say in this respect. As for a potential candidate for the generative principle that might exemplify the meaning of "integral," I have proposed in other contexts the principle of "complex holism," which I derived primarily from a sustained dialogue between Hegel and Jung (see Kelly, 1993) but which has since been significantly inflected by Edgar Morin's work on the principles of complexity (see Morin, 1977, 1980, 1981, 1982). The principle itself involves the recognition that:

> such terms as nature and spirit, the finite and the infinite, the universal and the particular, the individual and the collectivity, are dialectically related or mutually implicative. Any position which maintains the absolute priority of either term is necessarily abstract and, therefore, ultimately false. The only concepts not subject to the same constraints are those of the Whole or the Absolute which, though normally contrasted with the notions of the parts and the relative, include these, their apparent opposites, in their very concepts. That the holism advocated… is *complex* points to this necessary inclusion of particularity, differentiation, and relativity within the whole under consideration. The complexity in question also involves… the elements of dynamism and process. "The True," as Hegel says, "is the whole. But the whole is nothing other than the essence consummating itself through its development." (Kelly, 1993, p. 2)

The friendliness of this principle to Whitehead's overall approach (and specifically with respect to his central insight into the "fallacy of misplaced concreteness") should be obvious. To my knowledge, Aurobindo's understanding of "integral non-dualism" represents the richest, most creative, and far-reaching application of the principle of complex holism. One advantage of my terminology is that it is not *necessarily* associated with any particular metaphysical position.

Secondly, it allows for a more easily established rapport with contemporary scientific and philosophical developments. Still, it will sometimes be sufficient, or more precise, to use "integral" or "complex" instead of the more awkward "complex holistic."

Along with his commitment to a metaphysical Absolute—which, aligning himself with the Vedic tradition, he calls Brahman and describes as *Sat-Chit-Ananda*, or infinite Being-Consciousness-Bliss—Aurobindo argues forcefully against the once-only view of life and in favor or the doctrine of reincarnation.[16] At the same time, however, his eloquent plea (Aurobindo, 1951, p. 295) for a "logic of the Infinite" which rejects the "closed system" and "rigid definition" and instead looks for the "complete and many-sided statement" ought, in my opinion, to allow for the peaceful coexistence of both views. The possibility, and even the necessity, for such coexistence becomes even more apparent if one places the question of survival in the context of Aurobindo's statements about what we might call integral time. In the *Life Divine*, Aurobindo speaks of three "states of consciousness with regard to its own eternity" that the "Being" can assume (p. 327). The first he describes as the "timeless eternity" of the "Self in its essential existence," a state "without development of consciousness in movement or happening." The second is the "stable status or simultaneous integrality of Time," where "what we call past, present and future stand together as if in a map or settled design or very much as an artist or painter or architect might hold all the detail of his work viewed as a whole." The third is the "Time movement," that is, a "progressive movement" and "successive working out of what has been seen…in the static vision of the Eternal" (pp. 327-328). While he speaks of three states, or a "triple status," he also refers to the first and third together as the "two powers of the self-awareness of the infinite and eternal Reality," or to "the same Eternity viewed by a dual self-awareness" (p. 329). This leads me to suggest that a more coherent sequence would put the third "state" (the "Time movement") second, and that the "simultaneous integrality of Time," as the new third, would correspond to the "simultaneous integrality of Time" proper to the self-awareness of Brahman as the truly "infinite and eternal Reality." My suggestion is borne out by the concluding paragraph of the section of the *Life Divine* from which I have been quoting where he writes that the "coexistence" or "simultaneity" of these two moments or "powers"—"a power of status and non-manifestation [the first moment], a power of self-effecting action and movement and manifestation [my second moment]:

> however contradictory and difficult to reconcile it might seem to our finite surface seeing, would be intrinsic and normal to the Maya or eternal self-knowledge and all-knowledge of Brahman, the eternal and infinite knowledge and wisdom-power of the Ishwara, the consciousness-force of the self-existent Sachchidanada. (Aurobindo, 1951, p. 329)

There is a fascinating parallel here with a brief and undeveloped passage in the closing section of *Process and Reality* on "God and the World" where Whitehead refers to the "threefold creative act" of the universe. The first moment of this act is "the one infinite conceptual realization," by which I understand the infinite potential of the "primordial nature" of God. This corresponds quite nicely to Aurobindo's first moment of "timeless eternity." Whitehead's second moment is "the multiple solidarity of free physical realizations in the temporal world"—a clear match with Aurobindo's "Time movement." The third is "the ultimate unity of the multiplicity of actual fact with the primordial conceptual fact" (Whitehead, 1978, p. 346), which again is a very good match with my suggestion for Aurobindo's third moment, the "simultaneous integrality of Time" (the earlier qualifier—"stable status" is perhaps less compatible with Whitehead's insistence on divine process, though this is a matter of interpretation).

---

[16] Aurobindo's main argument can be summarized as follows: The universe is engaged in the evolution of consciousness. This evolution depends upon the emergence of ever more realized individuals who carry the process forward. If the spiritual gains of individual lives were lost at death, evolution could not proceed. Therefore, "the rebirth of the soul in the body becomes a natural and unavoidable consequence of the truth of the Becoming and its inherent law. Rebirth is an indispensable machinery for the working out of a spiritual evolution; it is the only possible effective condition, the obvious dynamic process of such a manifestation in the material universe." (Aurobindo, 1951, p. 672)

Now, anyone familiar with the history of philosophy will immediately see, if not the influence, then certainly the shadow of Hegel on both of these threefold formulations of the nature of time and its relation to the Absolute or to "God and the World." As to the question of influence, Whitehead claims not to have been able to read Hegel, which is ironic, given the same claim so often made by those who try to approach Whitehead. While the "logic of the Infinite" which pervades all of Aurobindo's work is clearly Hegelian in spirit, there are no references to Hegel (other than to him being a "great philosopher") in his voluminous works. Both Aurobindo and Whitehead, of course, were educated in England during the ascendancy of the British neo-Hegelians and so would have absorbed much of Hegel's spirit without necessarily even being conscious of the fact. Influence or no, however, it remains the case that Aurobindo's integral non-dualism and Whitehead's philosophy of process or organism are both profoundly resonant with key features of Hegel's speculative vision. Along with the dominant stress on holism, there is, as the above correspondences clearly indicate, the idea of a threefold dialectical structure or organizational pattern with respect to time and its relation to the divine and/or the cosmos. In place of the hackneyed, though still in some ways helpful, sequence of thesis, antithesis, synthesis, it is more revealing to contemplate such categorial triads as identity, difference, and the identity of identity and difference;[17] universal, particular, and individual; essence, appearance, and actuality. All of these triads map onto Aurobindo's (in my reconfiguration) and Whitehead's threefold distinctions in a way that clarifies their shared deeper meaning. From a Jungian point of view, these triads are all expressions of the dialectical relations between the archetypal sphere of the collective unconscious (first moment) and that of the conscious ego (second moment), relations which constitute the nature of the Self as complex whole (third moment) (see Kelly, 1993, especially Chapter One: *Logical Categories and Archetypes*).

Putting aside the question of influence, Aurobindo claims that his logic of the Infinite is an expression of the deeper truth of the Vedas and their philosophical elaboration in the tradition of Advaita Vedanta. In contrast with the classical Advaita ("non-dualism") of Shankara, however, Aurobindo's is qualified by the term "integral" (*purna*) so as to avoid not only the typical advaitan "negation" of the world (and therefore of time) as illusion, but also that of the modern West which has tended in the direction of the denial of transcendence and the reality of Spirit. Whitehead gives no explicit pedigree for his notion of God as the harmony of "antitheses" or "ideal opposites" (including, at their head, that of permanence and flux, and then one and many, transcendent and immanent, potential and actual). He does, however, use Christian allusions, most notably the phrase "Kingdom of Heaven" (Whitehead, 1978, pp. 348-350), but also with reference to the "judgment," "patience," and "love" of God. Notably absent in the writings of both figures are any references to the Christian Trinity. I say notably since, according to Hegel, the Trinity is the mythic or symbolic source of the idea of the dialectic, which is certainly the case for Hegel's foundational articulation of the idea.[18] The point I want to make here is that, regardless of possible routes of influence, the integral or complex holistic view of time that I am envisioning, given its clear compatibility with both Aurobindian non-dualism and Whiteheadian organicism, should be able to accommodate the simultaneous truth of the (predominantly eastern) reincarnationist and (dominantly Christian) once-only views of life and survival.

---

[17] The "identity of identity and difference" was Hegel's first definition of the Absolute (see Hegel, 1977).

Before pursuing this compatibility any further, I want to give the reader a better idea of what an integral or complex-holistic time-sense, in its most developed form, would look like by quoting an extraordinary passage from the last chapter of Aurobindo's *Synthesis of Yoga,* which he calls "Towards the Supramental Time Vision." The passage is striking not only because of the flow and rhythm that seem to mirror the manner in which the insights appear to have come to him, but also because of the way the insights themselves challenge us to remain open to the possibility that, as Whitehead says, "what cannot be, yet is." "All intuitive knowledge," writes Aurobindo,

> comes more or less directly from the light of the self-aware spirit entering into the mind, the spirit concealed behind mind and conscious of all in itself and in all its selves, omniscient and capable of illumining the ignorant or the self-forgetful mind whether by rare or constant flashes or by a steady instreaming light, out of its omniscience. This all includes all that was, is or will be in time and this omniscience is not limited, impeded or baffled by our mental division of the three times and the idea and experience of a dead and no longer existent and ill-remembered or forgotten past and a not yet existent and therefore unknowable future which is so imperative for the mind in the ignorance. Accordingly the growth of the intuitive mind can bring with it the capacity of a time knowledge which comes to it not from outside indices, but from within the universal soul of things, its eternal memory of the past, its unlimited holding of things present and its prevision or, as it has been paradoxically but suggestively called, its memory of the future. (Aurobindo, 1999, p. 897)

---

[18] Significant for a deeper exploration of this matter would be a consideration of the traditional distinction and relation between the so-called "immanent" and "economic" Trinities (that is, God in eternity and God in time, respectively). In "Eternity, Time and the Trinitarian God," Wolfhart Pannenberg provides a contemporary Christian reflection on the relation of the Trinity to time: "[T]he presence of God is different, since it is no other than his future. Furthermore, it is important that this statement refers to the trinitarian God as a unity, not to the three persons in their distinctiveness, except as they participate in the one divine essence. Concerning their mutual relationships it may be said that the Son is the future of the Father, because it is the Son who establishes the kingdom of the Father on earth. Similarly, the Spirit is the future of the Son since it is the Spirit who raises Jesus from the dead. But again, the Father is the future of both, the Son and the Spirit, since it is the Father's kingdom they bring about by their joint activities. As they all share in the communion of the one living God, however, they share in his eternal life that has no future outside and beyond itself to occur to it. The trinitarian God has eternal life within himself." Retrieved February 28, 2004 from
http://www.ctinquiry.org/publications/reflections_volume_3/pannenberg.htm

Obviously, if one has not been graced with the kind of "intuitive knowledge" Aurobindo alludes to here, the supramental time vision that he describes will be more or less credible or coherent, depending not only upon what one has been able to ascertain through conceptual analysis, but doubtless as well upon all kinds of unconscious or pre-reflective beliefs and assumptions. I will not argue the case here. Granting for the moment the authenticity of Aurobindo's experience and the conceptual coherence of integral time, what are the implications for the notion of reincarnation, the truth of which Aurobindo so strongly advocates?

To begin with, if it is the case that all of what to our ordinary consciousness is conceived of as lives yet to be lived, from the integral perspective of the intuitive mind "stand together," in Aurobindo's analogy, "as if in a map or settled design" along with the present life and those of the past (one is reminded here of Barbour's Platonia), one cannot cling too firmly to the idea of a soul which migrates from body to body, from life to life. We have seen that, for Whitehead's God, all (to us) past occasions are experienced in their "unfading everlastingness." For Aurobindo, at least, this is true as well for all future occasions, so that, despite the analogy of memory that is commonly invoked, it is more a matter, from the point of view of the Divine, of a *living* supersensory *presence*. Each life, in other words—however seemingly distant in our past or future—is always and already ensouled, is inalienably associated with its own soul, whose personal and singular drama is ever unfolding in the Eternal Now. And just as on a map—or better, in the actual experience of the territory—one cannot conflate two distinct locations and still know where one is, so one cannot conflate or identify, without significant qualification, any two lives, whether yours and mine in this shared present, or this life (yours or mine) and another in the apparent past or future. All of which seems to support the traditional Christian view of the soul as linked to only one life (and my reinterpretation of Nietzsche's view of the eternally occurring quality attaching to each individual life).

What then of reincarnation? To begin with, it is important to distinguish between the belief in a soul *substance*—which, at least in the way it is normally pictured, exists in the same space-time as the body with which it is associated and which, having "left" the body at death, "enters" a new one in a future life—and the *experience* of past-life recall and associated phenomena. Rupert Sheldrake (1989), in his book *The Presence of the Past*, suggests that his theory of morphogenetic fields provides a way of modeling what is experienced as past-life recollections without having to assume the literal belief in a transmigrating soul. The idea would be that, through the process of "morphic resonance," aspects of a current life (whether specific events acting as triggers, or more deep-seated structural or organizational patterns of a life or personality) call up memories stored in the non-local, immaterial, and potentially everlasting field associated with the previous life (or lives). Aurobindo's "supramental time vision" implies something very similar, only that it is not merely a question of residual fields but, as we have seen, of continually unfolding and fully present lives—a vital presence, not only of the past, but of the future as well in the "simultaneous integrality of Time." Given this presence, one can even more readily imagine how all the phenomena associated with the idea of reincarnation could be attributed to a kind of resonance between (from the perspective of the Divine) mutually present lives.

It is of course possible that the distinct souls I have evoked in association with all of our eternally unfolding lives are not the souls that people who believe in reincarnation have in mind, are not the "I" that says, "I was such and such in a past life," but are rather mere egos or personalities. Even if we grant these personalities the kind of vital immortality I am suggesting, and even if we can account for past-life phenomena without appealing to anything beyond them, how are we to answer Aurobindo's claim that, without rebirth, there is no way to provide for the evolution of consciousness—that is, for the "return" of Brahman from the scattered multiplicity of His self-induced involutionary trance? But Aurobindo has already supplied us with most of the necessary elements for an alternative formulation of this admittedly highly complex and speculative issue. In the first place, he himself, despite the premium he attaches to universal evolutionary process, speaks from a noetic certainty of the supramental realization, which he invites us to intuit, of Brahman as Infinite Being-Consciousness-Bliss, which means that the trance is not only self-induced but always and already broken. Or we could say that, as paradoxical as it might sound, Brahman or the Divine is *simultaneously* in the deepest of hypnotic slumbers *and* completely wide-awake. Without denying the reality of evolution, or more generally of time as passage (the second of our three "moments" above), therefore, we must be able—and indeed are called upon to do so given the complexity of the matter—to conceive of the nature of the soul and its relation to life and the after-life or survival in a way that does not depend *solely* on the image of a single soul substance journeying through time from body to body.[19]

The second element to consider is the notion of the Jivatma or "spiritual Person" who "is one in his nature and being with the freedom of Sachchidananda who has here consented to or willed his involution in the Nescience for a certain round of soul-experience, impossible otherwise, and presides secretly over its evolution" (Aurobindo, 1951, p. 680). This "Person" does not itself evolve but is "unborn and eternal although upholding the manifested personality from above" (Aurobindo, 1972, *Letters*).[20] It is to this Jivatma that I take Aurobindo to be referring, in the passage I quoted earlier on the supramental time vision, when he speaks of "the spirit concealed behind mind and conscious of all in itself and in all its selves." It is this Person too who stands in full possession of "its eternal memory of the past, its unlimited holding of things present and its prevision or, as it has been paradoxically but suggestively called, its memory of the future." Given this, to us, paradoxical relation to time, could we not conceive of the many "selves" which, from one perspective (that of the second "moment"), manifest sequentially as a number of karmically related lives, as (from the third, integral or complex holistic moment) *also* so many *co-existing sub-personalities* of the more complex Person? Would we not have here an analogue to Fechner's understanding of World Spirits or Angels?[21] A scale of beings or selves begins to suggest itself, in order of increasing complexity and—with certain qualifications—wholeness, each with its own constraints and freedoms with respect to the experience of space and time. At the highest or most inclusive level there would be the Godhead (Aurobindo's Brahman or Sachchidananda), the Whole or Absolute by any other name. Next would be the cosmic Deities, of which there might be an indefinite number, and which might include the God of Fechner and Whitehead. Whether or not such Deities experience themselves in their own kind of time with an unknown future is, as we have seen, open for debate. Presumably the World Souls would exist as sub-personalities or part-selves of the Cosmic Deities (again, not knowing if solar systems, galaxies, or even larger cosmic structures have corresponding selves), just as individual soul-personalities would be members of the community of selves that constitute, or are gathered together in, a given World Soul. In this logic, the Jivatma would be a Self intermediary between a World Soul and the soul-personality or "Psychic Being," as Aurobindo most often calls it.[22] As for the Jivatma's time sense, there is no reason why it could not, while being simultaneously conscious of standing "outside" or "above" time as experienced by its many part selves (that is, as you and I experience it most of the time), also be capable of novel experience and so, even if it doesn't evolve, has something at least analogous to our experience of an unknown future. Whatever the likelihood or specific nature of such a scale of selves, it ought to be clear in any case that there is no reason to accept a forced choice between one life or many, or indeed, as we have seen, between the members of any number of categorial oppositions that present themselves to the metaphysical imagination.

---

[19] As Bache (2006, pp. 120-121) points out: "There is nothing inherent in the theory of the soul that commits us to the atomistic isolation of previous theories. The soul is a quantum-like phenomenon, an open field suspended in dynamic tension with surrounding fields."

[20] Aurobindo calls the evolving soul the "psychic being," the *caitya purusha*. It is the representative of the *Jivatma* or "soul essence."

[21] In the fourth volume of his *Vehicles of Consciousness*, Poortman asks: "What, then, *is the* world-mind? Is it the sum total of the whole scale of the units of consciousness embracing each other? In that case, there must be an increasing—and perhaps also decreasing—degree of unity or perfection. What in fact it comes down to is that we are concerned here with concrete, superposed units which are at the same time limited, in which case we can never come to the point where we have a transcendent unit which really embraces everything. These limited units may, in their own way, be quite venerable…as were Ishvara in Indian thought and Plato's Demiurge, but they remain what I have called infrasubjects. It is even possible

What is needed above all in such matters is the cultivation of a way of thinking, a way of "seeing" and "hearing" that is sensitive to the wholeness and complexity of the things we name self or soul, life, and time, and knowing that the naming in no way diminishes the mystery we are trying to fathom. Two of my great allies in this respect have been Edgar Morin and Jean Gebser. From Morin I have learned to see the complexity of wholeness in terms of such principles as the *dialogic* and *recursivity*. Like Hegel's dialectic, the dialogic concerns the relation between antitheses or incompatibles. Muting somewhat Hegel's stress on the reconciling potential of the third moment, Morin defines the dialogic as the "symbiotic combination of two [or more] logics [that is, discourses or dominant categories] which remain *both* complementary *and* antagonistic" (see Morin, 1977, p. 80; 1980, p. 82). Recursivity refers to the circularly causal relation between structural elements or categories that constitute a complex system. A process is recursive when it "causes/produces the effects/products necessary for its own regeneration" (Morin 1977, p. 186; 1981, p. 162). It is "the circuitous process whereby the ultimate effect or

---

to imagine these demiurges—however central or exalted their status might be within their own sphere—coming together from time to time on a friendly basis and perhaps even… making mistakes. This is a clear example of their infrasubjectivity and I can only say how right Heymans was to refuse to place the world-consciousness of psychical monism, with all its sub-divisions…, on the same footing as the traditional concept of God." (Poortman, 1978, p. 110).

[22] See Frederick Myers's suggestive conclusions: "I hold that ... it is possible that other thoughts, feelings and memories, either isolated or in continuous connection, may now be actively conscious... in some kind of coordination with my organism, and forming some part of my total individuality. I conceive it possible that at some future time, and under changed conditions, I may recollect all; I may assume then various personalities under one single consciousness, in which ultimate and complete consciousness, the empirical consciousness which at this moment directs my hand, may only be one element out of many." (Cited in Taylor, 1996, p. 66)

product becomes the initial element or first cause" (Morin, 1977, p.186). With the help of Morin I see how the relation of the one to the many (whether of lives or of selves), of stasis to flux, or the eternal to time, is to be conceived dialogically and recursively, giving up the need for what Hegel calls the “fixed determinations” of merely intellectual knowing (Hegel’s *Verstand*, Aurobindo’s “lower Mind”). The One both produces and repels the Many, which produce and repel the One. “Eternity is in love with the productions of Time,” says Blake. Yes, but there is also enmity, strife, or opposition. Blake again: “Without Contraries is no Progression. Attraction and Repulsion, Reason and Energy, Love and Hate, are necessary to Human existence” (from *The Marriage of Heaven and Hell*).

From Gebser (1985) I get the suggestive coupling of “integral” (which he derives from Aurobindo, without, however, adopting his metaphysics) with “aperspectival,” which to him means the overcoming of the kind of spatial-perspectival mindset now commonly associated with the Cartesian-Newtonian worldview. The “single vision” of this mindset is more or less locked in the second “moment” of difference and forced alternatives (transcendence or immanence; many lives or one, etc.). For the integral-aperspectival consciousness, by contrast, incompatible categories are “transparent” or “diaphanous” to one another, as are the structures of consciousness (in this case, especially the mythic—which is “preperspectival”—and the mental, which is perspectival) within or in relation to which the categories are variously inflected.[23] According to Gebser’s characterization of the structures of consciousness, the traditional view of reincarnation—with its associated view of cyclical time, and with its more symbolic or imagistic and narrative qualities (the soul as a migrating entity)—would seem to be more at home in the mythic structure. The Christian once-only view—with its associated view of linear time, and despite its mythical elements (view of last Judgment, of Heaven and Hell)—could only arise after the emergence of the mental structure. The modern secular view—linear time, materialistic, and therefore no real survival—is firmly embedded in the late or “deficient” mental (where a more contemplative and qualitative reason is increasingly reduced to a. more instrumental and quantitative rationalization; see Gebser, 1985, p. 93*f*). Whereas a merely or predominantly mental approach (and particularly in its deficient mode) to the question of survival will tend toward an exclusive identification with one of the possible alternatives—say, the (seemingly more “scientific,” and therefore mental) view of a single life that “resonates” with the fields of past lives versus the more traditional (and originally mythic) view of reincarnation as transmigration—an integral-aperspectival view will see the virtues of both alternatives, along with their limitations, and will feel free to shuttle from one to the other as the context demands. What I have stressed in this paper is that such an integral-aperspectival view will require a suitably complex rethinking of the nature of time. “The coming to awareness of ‘time’ in its full complexity,” as Gebser says, “is a precondition for the awakening consciousness of time-freedom [that is, freedom from mental-perspectival, and therefore spatialized, time]. The freedom from [perspectival] time in turn is the precondition for the realization of the integral consciousness structure that enables us to perceive the aperspectival world" (Gebser, 1985, p. 289). The integral-aperspectival can therefore be interpreted not so much a structure of consciousness (like the mythic or the mental) as it is an "opening" or clearing, as Heidegger might put it, between or in the midst of the various structures and their associated categories.

---

[23] The ancient Stoic view of eternal recurrence—which is both cyclical and materialistic, imagistic (the universal fire) and rationalistic (determinism)—is typical of a period (late antiquity) where mythic and emergent mental elements coexist in various syncretistic forms (the Christian view represents another such form). Nietzsche’s version of eternal recurrence, though so close to the Stoic view in many respects, also manifests the dawning of the integral-aperspectival. This is evident in Nietzsche’s stress on openness and freedom, and in the transparency between myth and philosophy, between the symbolic and the conceptual, in his major writings (especially *Thus Spake Zarathustra*).

Jennifer Gidley summarizes Gebser's position as follows:

> Gebser's nuanced *concretion of time* does not represent a linear developmental endpoint like that of the modernity project, nor is it endlessly recursive in non-directional cyclical space as in Eliade's "myth of the eternal return"….. Integral consciousness as understood by Gebser does not place mythic and modern constructions of time in opposition to each other, as both modern and traditional approaches tend to do. Alternatively, Gebser's *temporic concretion* is an intensification of consciousness that enables re-integration of previous structures of consciousness—with their different time senses—honoring them all. It opens to new understanding through atemporal translucence whereby *all* times are present to the intensified consciousness *in the same fully conscious moment.* (Gidley, 2007, p. 176)

This integral "moment" where "all times are present" resonates well with my proposal for all lives as participating in an ever-living present. I also applaud Gidley's insight that Morin's paradigmatic notion of "RE" (which is primarily associated with the notion of *recursivity* or circular causality, as epitomized in all living or self-organizing processes)[24] "appears to align with Gebser's concretion of time" (p. 183). In this context, however, the recursion in question is not that of evolutionary processes, though neither does it contradict these processes. Rather, here it is question of a theoretical and methodological recursion between different "temporics" or time perspectives (see Gidley, 2007, p. 174) and their related conceptions of the soul and its associated life/lives. In contrast with an integral or complex-holistic (meta-) point of view, these conceptions are generally embedded within the mythical and (sometimes deficient) mental structures. The latter's perspectival ordering, in particular, militates against a generative encounter among competing views and conceptions.

While through the glass of merely mental consciousness we see ourselves and our world but darkly, in the clearing of the integral-aperspectival we can wander freely in worlds without borders and behold one another face to face.

Concluding Remarks

In contrast to most reflection on the nature of the soul and its relation to the afterlife, this study's focus on the dimension of time has led to several novel proposals:

---

[24] For Morin, living processes are not only self-organizing, but auto-eco-*re*-organizing, where "eco" refers to the necessary coupling of the organism or system with its environment, and "re" indicates that, as *living*, the organization is ever renewed. This renewal involves a cluster of related processes, including repetition, regeneration, and reproduction. At the heart of RE is a dialectic—or dialogic, as Morin prefers to call it—between the "retro" (preservation or reestablishement of the same) and the "meta" (the emergence of novelty). See Morin (2005).

1. *A neglected possibility for the nature of survival: the "past" (along with all moments, all lives) as "eternally occurring" in an "ever-living present."* This is suggested through the pursuit of an intuition through encounters with Nietzsche, Julian Barbour, Whitehead, and Aurobindo. This leads to:
2. *A (modified) resonance model of past life phenomena* (modified since, in contrast to Sheldrake and Laszlo, it is not merely a question of resonance between a given presently embodied life and the residual fields of past lives, but of resonance among the fields of so many mutually present lives); and
3. *The possibility of harmonizing the traditional Christian (and Jewish and Muslim) "once-only" view with the many lives view normally associated with belief in reincarnation.* Provided, that is, we work with:
4. *A more integral, complex-holistic model of personality: including the possibility of a higher-order personality* (jivatma; daimon? angel?) as an intermediary between human personality and the Godhead as the Absolute Person. Here we are guided by Fechner (*anima mundi*), as well as by the analogy of sub-personalities (Myers) or complexes (Jung). The suggestion here is that what to us appears as a series of lives arrayed in a line leading up to the present might, to the higher-order personality, be experienced as so many mutually contemporary *dramatis personae*. (Given the properties of resonance, we need not imagine that the "cast" of any given higher personality be fixed. By the same token, we can imagine that any one life might belong to several different "casts" simultaneously. There is no reason, moreover, not to consider the possibility of more than one person sharing the same past life).
5. *This kind of inquiry and research demands the articulation and enactment of an integral or complex-holistic method/way of thinking and speaking/writing*, especially when dealing with such difficult issues as the possibility of survival. The model here is Hegel and Aurobindo's "logic of the Infinite," which I read through the lens of Morin's principles of complexity and Gebser's notion of the integral-aperspectival. Such a logic allows us to hold in creative tension what otherwise appear to be mutually exclusive points of view.

For this kind of logic—whether we call it integral-aperspectival or complex-holistic—the question of time and the nature and fate of personality or the soul is an occasion for subtle musings and intuitive leaps, which to the uninitiated (or simply uninterested) seem both wild and gossamer thin. "It is not indispensable to formulate mentally to oneself all this," Aurobindo once counseled one of his disciples,

> one can have the experience and, if one sees clearly with an inner perception, it is sufficient for progress towards the goal. Nevertheless if the mind is clarified without falling into mental rigidity and error, things are easier for the sadhak of the yoga. But plasticity must be preserved, for loss of plasticity is the danger of a systematic intellectual formulation; one must look into the thing itself and not get tied up in the idea. Nothing of all this can be really grasped except by the actual spiritual experience. (Aurobindo, 1972, pp. 265-287)

Even awaiting the experience, we can take his good counsel and strive, since we cannot escape the bodily death, to avoid that all-too-common intellectual rigor mortis which would pronounce the matter closed and settled one way or another.

Using Developmental Theory: When Not to Play Telephone Games

Sara Nora Ross

Abstract: As a powerful way to help understand the behaviors of people and social groupings of all kinds, developmental stage theory attracts attention and use outside of purely academic environments. These uses take the form of written materials and many kinds of interventions. The level of accuracy of developmental theory information generated and used outside of academe demonstrates wide variety. This variety is reflected in materials and interventions. The information used in materials and interventions becomes increasingly distorted as it becomes further removed from original theoretical sources. This has major implications for the ethics and expertise issues that are inherent in applied developmental theory. A classification scheme of information-use behaviors, many of which contribute to distortion processes, is used to code actual cases of creating and disseminating distorted developmental theory information, invoking the metaphor of telephone games. Case evidence indicates that casual, illustrative figures in a 2006 book by Wilber were used by others for various serious and theoretical purposes, and resulted in major distortions of developmental theory. Wilber's figures represent problematic issues and errors, including distortion of theory, if they are used—as they indeed were—for any purpose more serious than his original purpose. Stemming from those issues and errors, a highly distorted picture of cognitive development and a pseudo-version of Commons and Richards' Model of Hierarchical Complexity theory emerged, telephone game-like, in the cases discussed. Errors were widely propagated on the internet. Because outside of academe, specialized expertise in developmental theory is difficult to acquire, the sub-field of applied developmental theory requires not only accurate information but also strong communication ethics to govern behaviors of information providers. Such providers need to protect themselves at the same time they protect and inform consumers of their information. This process of knowledge sharing and knowledge building can be shaped by adopting guidelines and a basic operating principle proposed here. Guidelines and principles, without institutionalization, are insufficient support. A new Institute of Applied Developmental Theory could provide the supports, standards, and effectiveness the sub-field of applied developmental theory needs if its power to address 21st century challenges, which sorely need it, is to be realized.

Keywords: applied developmental theory, behaviors, classifications, Commons, communication ethics, developmental theory, Institute for Applied Developmental Theory, knowledge-building, Model of Hierarchical Complexity, Richards, stages, Wilber

SOME RIGHTS RESERVED

Introduction

Known by different names around the world, the telephone game is one in which the starting player whispers a sentence or phrase to the person next to him or her. That person, and each successive person in the circle or group, whispers the sentence or phrase to the next person, each time like passing a secret no one else should hear. When the secret has made its way around the entire group, the last person to hear it announces the secret aloud for all to hear. Typically, all participants are surprised to hear *how* different the final version is from the version they heard. This motivates the other participants to report out loud the version they "got." More differences appear. When originators of the sentence or phrase eventually announce the version they launched, it becomes possible to trace the path of the *inevitable distortion*.

The telephone game is a metaphor for the distortion process of acquiring first, second, third, or even fourth-hand information when writing or publishing. With respect to this essay, my specific concern is with distortions in developmental stage theory that appear and then re-appear in various written forms. In addition, I concern myself primarily with distortions that can be traced to a book by Ken Wilber, which emerged as a significant source in recent instances when it came to dissemination of both accurate and inaccurate information.

To address that concern, I set three goals for this essay.

- Post an "advisory alert" about the widening propagation of particular errors in representing, describing, and applying developmental stage theory.
- Raise awareness about various sources of errors.
- Contribute constructive solutions to deal with responsibilities to "let the information-users beware" and "let the information-providers beware."

To accomplish those goals, this essay has the following objectives:

1. Discuss the appeal and the importance of developmental stage theory and why errors and any propagations of errors *matter;*
2. Describe some sources of errors;
3. Portray a case of telephone game-like information sharing about developmental theory;
4. Point to dynamics and impacts of the game's distortions;
5. Articulate guidelines for reading and writing to prevent such problems; and
6. Propose some concrete ways forward.

Developmental Stage Theory

Why Accuracy Matters

From its home in academic specialties under the umbrella of psychology, developmental stage theory is spreading beyond such oversight to the world of practical applications. As one of the most useful dimensions of individual and social behaviors to understand, this is an important trend. Developmental approaches are finding their way into increasing numbers of personal, organizational, leadership and other social development books, trainings, and consultation efforts.

This means that people recognize the value of developmental theory in general and begin to have ideas about how it can be used to understand themselves, other people, organizations, and larger social groupings. Once we believe we understand something, we may be motivated to develop interventions using it. Interventions may take such forms as education, training, and related materials, or consulting, advising, and even activism. Interventions, by definition, are efforts to impact others. When we aim to impact people's lives, organizational strategies and sustainability, how issues are addressed, and other social affairs, we tread in the territory of *expertise* and *ethics*. These are two sides of the same coin, and both are serious business. The governing principle in any kind of serious business is *first, do no harm*.

How could the use of developmental theory cause any kind of harm? Harm would vary by how theory was used in specific contexts, but some generalizations are possible.

1. An obvious one is that if theory or its related information is taught incorrectly, it will be learned and used by others incorrectly.
2. Another is that if it is incorrectly used to 1(a) assess situations, 1(b) analyze individual, group, or organizational performance, 1(c) be the basis for giving advice on growing edges to develop and changes to make and/or 1(d) design interventions, it can cause confusion, resistance, and/or conflict if such interventions "shoot too high" by introducing inappropriately difficult challenges, expectations, or organizational procedures or structures. These undesired results would be because 2(a) the capacities and possibilities for performance at each stage of development are radically different, 2(b) developmental performance does not change overnight, 2(c) the developmental change process involves different elements at each stage (Commons & Richards, 2002), and 2(d) individuals, groups, and organizations cannot skip stages of developmental performance (Commons, Trudeau, Stein, Richards, & Krause, 1998; this paper by Commons, Trudeau et al. includes a theoretical explication of these and other relevant points).
3. Another general example is if developmental theory-based interventions "shoot too low" in setting expectations because existing performance is inaccurately judged as already at a higher stage. Such a misdiagnosis could lead to false complacency about the nature of challenges that would actually be required to meet stated goals.

The overall message here is that humans and their social groupings are extremely complex and variable, and uses of developmental theory could do harm if they are not based on sturdy foundations.

Issues and Errors in *Integral Spirituality* Figures

If I or other specialists in developmental theory had read Wilber's (2006) *Integral Spirituality*, I expect its errors in representing developmental stage theories would have come to the fore sooner than this, perhaps resulting in correction before further dissemination and repeating it in his *Integral Vision* booklet (Wilber, 2007). As it is, I came to this only in the process of figuring out how others' problematic representations, comparisons, and uses of developmental theories had emerged. The process meant tracing backwards through a short series of written works, and finding that *Integral Spirituality* played a role akin to the first speaker of the sentence launching a telephone game. That "originating sentence" had technical errors. One of them in particular has been widely propagated and built upon, as described later in this essay.

Six years before publishing *Integral Spirituality,* Wilber published *Integral Psychology* (2000). In the latter was reflected the significant amount of work he did to produce many developmental stage correlation charts. He clearly had investigated theories and research projects sufficiently to chart them and offer the series of charts as a resource to people.[1]

Since then, in the two more recent books mentioned above, his representations of "major developmental lines" lack coherence with that earlier work and certain figures contain errors. The first point to make, however, is that the task and purpose of referring to major developmental lines is different from the earlier task and purpose of the extensive charting of individual stage theories. This more recent use of developmental theory is to indicate Wilber's concept of different lines of development (Wilber, 2006, 2007), and his discussions indicate that purpose. In putting developmental theory to this use, his earlier straightforward approach of identifying an individual theory and its stage categories has largely, though not entirely, been replaced by grouping disparate theories together if they represent to Wilber a particular "line." This shows up in the form of table-like figures. In *Integral Psychology* (2006) it is the two full-page Figures 2.4 and 2.5, inserted between pages 68 and 69 (in *Integral Vision* a nearly duplicative representation is Figure 14, pages 112-113). As should become clearer below, I suggest a first source of potential errors is if users assign purpose to such figures beyond the limited one of referring to Wilber's concept of major developmental lines. I say this for two reasons: (a) there are no sources cited for where the represented development theory information came from, and (b) *classifying* theories is different from describing, explaining, or applying them.

As the telephone games portrayed later in this essay indicate, the figures have been put to different purposes than just *referring to Wilber's concept of* major developmental lines. They became a significant source used by others for classifying, describing, and applying developmental theory. This figures-as-source has errors *if it is used for anything but* the limited purpose of referring to Wilber's concept of major developmental lines. Because it *has* been used for other purposes, it seems important to identify issues and errors that already have, or could, continue to propagate through others' reliance on them. These are outlined below.

Issues

Issue 1. Wilber classifies into one group the author names "Commons/Richards Piaget/Aurobindo" (Wilber, 2006, Figure 2.4, p. "68a"). A more communicative way to indicate these separate names could be "Commons & Richards; Piaget; and Aurobindo," to indicate the names are associated with three different developmental frameworks. The group is labeled by Wilber as "cognitive." There is actually a fourth framework embedded in that group's representation. This shows up via the overlay of "vision logic" categories, which are Wilber's

---

[1] Unfortunately, the charts do not include citations of the works used to develop the charts. As a result, only a person who is already intimate with a given theory would likely be equipped to identify if or where errors and omissions occurred in presenting it (e.g., in charting Torbert's work, p. 636; for correct stages, see Torbert & Associates, 2004).

(see, for example, the text and aforementioned charts in Wilber, 2000), although Wilber's name is not included in that "cognitive" group. If people use this classification scheme's labels to help them describe, explain, or apply developmental theory, the following indicates at least one ramification.

The scheme does not accurately represent the stage category names used by the indicated authors, nor all of their stages, and in some cases, even their stage placements. This is because it conflates three different frameworks for the purpose discussed above of suggesting a developmental line. Thus, the figure's resulting stage list cannot not fully agree with any of the original authors' lists of stages and names for them because they used different terms and methods to identify the sometimes different places to "notch the stage measuring stick" they used in describing human behaviors. Wilber's (2000) charts indicate such differences.

My focus in this issue is on the "cognitive" group for reasons indicated below. However, the general issue pertains to the other "lines" into which he groups multiple authors' work: those labeled "values" and "self identity."

Issue 2. It is misleading to classify the developmental framework of Commons & Richards as *only* the "cognitive." Whether referring to their work dating from the 1980's (e.g., Commons & Richards, 1984a, 1984b) or their more recent work (e.g., 2002), the work does not represent a *cognitive* development framework. As a developmental behavioral framework, it is broader than that, i.e., it is applicable to every such "line" of development. This broad applicability is because the Model of Hierarchical Complexity (Commons et al., 1998; Commons, Goodheart, Pekker, Dawson, Draney, & Adams, 2007) is a content-free, domain-independent general theory of orders of hierarchical complexity and stages of task performance at such orders, providing universally applicable, mathematical axiom-based measures thereof. "Task" refers to actions performed by machines, neural networks, animals, humans, or larger social groupings (Commons, 2006). Thus, while the theory applies to any activity in the classification commonly called "cognitive," it is not confined to only that kind of activity: it transcends and includes categories that are based on specific content. In this and other respects, this paradigm is qualitatively different from developmental stage theories based on content even while it describes and measures developmental performance in such content categories as various stage theories are concerned with. I recommend Dawson-Tunik (2006) as an excellent resource for explicating these concepts and citing a range of studies related to them.

Errors

In the column designated the "cognitive" developmental line (Wilber, 2006, p. "68a") Commons & Richards' *systematic* stage is omitted. This stage follows the formal operations stage recognized by them (Commons, Richards, & Kuhn, 1982) and Piaget (Inhelder & Piaget, 1958, as cited by Commons, Richards, & Kuhn, 1982). When presenting a list of developmental stages, to omit one stage can result in domino effects from that single error. In this case, the effect was to "fill the gap" left by the omission: lowering by one stage the presentation alignments of the metasystematic, paradigmatic, and cross-paradigmatic stages (note: the metasystematic stage is incorrectly portrayed as "meta-systemic"). Table 1 indicates the correct stage names and the entire stage sequence formalized in the Model of Hierarchical Complexity.

When entering a score into an analysis, the ordinal numbers shown in Table 1 are used. See Commons (2006) for a description of the stages that includes for each stage a *generic* description of what kinds of tasks are done, how they are done, and the end results of doing them.

Table 1. Stages of Hierarchical Complexity

Stage Name	Stage # and Task Score	Stage Name	Stage # and Task Score
Computational	0	Concrete	8
Sensory or Motor	1	Abstract	9
Circular Sensory Motor	2	Formal	10
Sensory-Motor	3	Systematic	11
Nominal	4	Metasystematic	12
Sentential	5	Paradigmatic	13
Preoperational	6	Cross-paradigmatic	14
Primary	7		

Note: Adapted with permission from p. 89 in M. L. Commons (2006), Measuring an approximate g in animals and people. *Integral Review: A Transdisciplinary and Transcultural Journal for New Thought, Research and Praxis, 3,* 82-99.

To summarize this compound error: in Wilber's (2006) Figure 2.4, one stage is missing, and the three that follow it are "moved down" to fill its missing place in the stage hierarchy. Along with the conflation of theories and their other stages, this error shows up as a key player in the telephone game problems discussed below.

Possibly relevant to those who use Wilber-unique "vision-logic" terminology, in *Integral Spirituality's* Figure 2.4, (and in *Integral Vision's* Figure 14), low vision logic is stage-associated one stage higher than in *Integral Psychology* (2000) charts. There could be various explanations. It may be directly related to the Commons & Richards representation error described above, because the vision-logic overlays use the terminology of Commons & Richards. It may be connected with eliminating "middle vision logic" from the more recent figures without making corresponding adjustments. And/or, it may be related to eliminating in these recent figures the use of the "transition" stage category used in structuring the Wilber (2000) charts.

Kegan's 5th order/stage is represented one stage higher than Kegan (1982, p. 86) situates it; he aligns it with Loevinger's autonomous stage.

Integral Spirituality's Figure 2.5 (and *Integral Vision's* Figure 14) shows an incorrect insertion of a "pluralistic" stage as part of Gebser's framework (see Gebser, 1949/1985). In addition to Gebser, also see Gidley (2007) for discussion of the classification error involved in treating Gebser's work as if it applied to individuals in the way developmental stage theories do.

Summary

This discussion of developmental theory made the following major points. Developmental theory is a powerful, much-needed, and therefore attractive dimension to employ in any kind of work related to human behavior and social issues. Such work goes beyond strictly academic study to the other worlds of knowledge sharing, practice, and interventions. Accuracy in understanding and using developmental theory *matters* because its use has impacts on other people, their efforts, their organizations, and even their institutions and societies.

Developmental theory can be used to illustrate or make points that have different purposes. In recent years, Wilber (2006, 2007) used various groupings of developmental theory to illustrate and briefly discuss his concept of major developmental lines. The discussions of such lines were not the focus but rather one aspect within the books in which they appeared. The table-like figures used to support his discussion raise certain issues and represent errors *if they are used by others for any other purpose* than Wilber used them, i.e., to *illustrate his concept* of developmental lines. The figures in *Integral Spirituality* were cited in work that used them for a *different* purpose. The purpose was theoretical and the work propagated to others. One issue and one set of errors, above, thus showed up in telephone games portrayed below. Therefore, this section listed the main issues and errors for two purposes: (a) to alert possibly-affected people to them, and (b) to present enough detail to serve as bases for additional points and indicate the content referred to later when portraying the telephone game dynamics.

Ethics and Expertise

As I wrote more than five years ago (Ross, 2003), outside of those who specialize in it, developmental theory seems susceptible to casual uses and abuses. One way this seems to happen is by believing that if one knows the names of the labels used to designate stages of development in a given theory, and has read some sort of description about the stages, that one knows developmental theory. This can result in mistaken beliefs about how much knowledge is enough and perhaps mistaken assumptions about possessing expertise. If we have mistaken assumptions about our expertise, and have less than we believe, we may generate and share work that may not be reliable enough for others to rely upon.

Without a great deal of support—such as experts to learn from or work with directly and/or some system in place to review, correct, advise about, and otherwise evaluate our performance in describing, explaining, or applying theory—we can risk believing we have knowledge we may not have. When we enter the territory of using our actual or presumed knowledge to impact others' lives, our ethics *and* our expertise can be on the line. Specialized expertise is not a costume we would want to don casually to represent ourselves, for example, as educators or advisors. This has a lot to do with *communication ethics.* In communication ethics, a discipline in its own right, "the value of care is considered of central concern" because "ethics encompasses issues of care and trust, social responsibility and environmental concern and identifies the values necessary to balance the demands of performance today *with responsibilities for tomorrow*" (Institute of Communication Ethics, 2008, emphasis added).

The universal point throughout this essay is that care-full ethics in our work and communications about our work apply to all of us. Especially—but not only—in these years of ubiquitous internet information inputs and outputs and self-publishing options, an ideal communication ethic would include being transparent about sharing whatever information about our work could possibly impact the amount of reliance placed on it by our peers, clients, students, or other users. This is particularly vital when using developmental theory.

Finally, being care-full about readers' possible interpretations of this section, I emphasize that just because Wilber's work is the only specific work discussed thus far does not mean that this brief discussion of ethics and expertise singles out him or his work in any particular way. Presenting the range of developmental theory concerns, which involve his work, comes first for the sake of coherent organization to accomplish the essay's objectives.

Casual or Formal?

From the abstract stage of developmental task performance onward, adults do a very good job of classifying things (Commons et al., 1998). Most classifications evolve casually, e.g., from talking about individual chairs and tables to classifying them as furniture. Once there is a new classification, it engenders further refinements into more classification schemes, e.g., office furniture, living room furniture, dollhouse furniture. It is efficient to classify things. All types of classifying enable us to generalize. When we can generalize, we do not have to show or talk or write about specific examples, but rather, just refer to a *class* of things that share similar features. *Casual* classifications come so easily to most adults that it can be easy to overlook the fact that other classifications are not casual at all.

Some classifications are *formal*. This is because they are based on rigorous theoretical and empirical research. Formal classifications are motivated by the need to organize and share knowledge. Thus, they have specific uses and special definitions and concepts. Generally, they are used in formal, not casual, applications. Much of what happens in a society is through applications that grow out of theoretical and empirical research. Such applications can range from teaching, consulting, and publishing to the creation of organizations, services, technologies, and products. This suggests that regardless of their settings, formal applications always have some importance: they mean serious work, intended to inform or otherwise impact those who use them. When people apply and use formal classifications and concepts as if they were casual, confusion can result. Sometimes unintended damage to others can result, too (discussed further below).

Sometimes people who are not experts in a formal academic field develop interests in subjects addressed by that field. Equally possible, experts in one formal academic field may want to work on subjects that call for information from outside their discipline. Sometimes non-experts want to write about their interests in such a subject and share it with others. Sometimes they try to develop their own comparisons of experts' formal classification schemes. Regardless of different scenarios, subjects of formal study include many formal classification schemes, concepts, and comparisons among them. When non-experts in an area use its formal classifications and concepts, or develop casual comparisons of formal classification schemes, confusion can result. Again, sometimes unintended damage to others can also result.

The expanding range of approaches to interdisciplinarity, e.g., those mapped by Stein (2007), suggest such approaches may be particularly vulnerable to such specialist/non-specialist related problems. As Stein indicates, collaborative knowledge-sharing and -building (see Murray, 2006) are even more essential when there is no single authoritative discipline or expert over an application of knowledge.

To summarize and further apply these classification notions, Table 2 suggests the kinds of behaviors that may show up, ranging from classifying, comparing, analyzing, and using. This scheme cannot be all-inclusive of possible variations, nor does it attempt to define criteria. The hope is that the general scheme may raise awareness of different classes of work. This in turn may help people investigate credibility and try to classify their own or others' work when needed.

Table 2. Classification of Casual and Formal Behaviors

Formal Behaviors	Casual Behaviors	Casual-Casual Behaviors
F1. Formal classifications and concepts	C1. Casual uses of F1 formal classifications and concepts	CC1. Casual classifications and concepts
F2. Formal uses of formal classifications and concepts	C2. Casual comparisons of F1 formal classification schemes	CC2. Casual uses of any C-classes of work
F3. Formal comparisons of formal classification schemes	C3. Casual uses of F2 work	
	C4. Casual uses of F3 work	
F4. Formal analyses of F3 work	C5. Casual uses of F4 work	
Confused Formal Behaviors		
CF. Attempted Formal uses of C or CC classes of work assume they are F classes of work.		

Telephone Games with Developmental Theory

Preface: Over the last 60 or so years in the Western world, empirical researchers, along with theorists who do not perform such evidence-based research, have described stage theories of human development in textbooks, trade books, edited collections in books, and peer reviewed journal articles. (Trade books are the type commonly found in bookstores that serve the general public.) Authors use such methods to publish updates to their work when they have new research findings to report, particularly journal articles. Their published work is *primary source* material. It is primary because it "comes straight from the original horses' mouths," as the saying goes. Except for work published in trade book form, it has been critically reviewed by other experts before publication. People who want to be sure they have credible information about developmental theories use up-to-date, first-hand, primary source material generated by such Formal Behaviors as those listed above.

I did not know there was a distortion of developmental theory circulating until we happened to encounter some of its results in written forms. "We" refers to some *Integral Review (IR)* editors and a board member of ARINA, its publisher. Some months ago, IR received a manuscript that used developmental stage terms and descriptions in erroneous ways I had never seen before. The paper had no citations of the developmental information source, but did identify someone who was a source of advice in writing the paper. Some time later, an ARINA board member and I received, respectively, one and two different email-broadcasted notices about a new internet-published product; it had different authorship than the earlier manuscript had. The board member read it before I did, and commented on an error evident in it. I then prioritized reading it.

I found it quite curious to see that the same developmental stage-related errors in the earlier manuscript were not only showing up in the publication but more were showing up too. These were used to build a substantive discussion in that product. The product cited its sources of information. I wrote to the source cited in relation to the errors. I pointed out the errors and discussed them in an email. Subsequently, I requested and received the material cited as source information. It was not formally published (e.g., in a journal or book) but, the author told me, it was considered by the author to be in draft form, in the public domain, and free to share. That material cited and used Wilber (2006) figures' information to organize and describe developmental theory. This use was *different from just discussing the concept* of major developmental lines, the use to which Wilber put the figures.

Each written product encountered above was of a different genre, and all of them clearly indicated their authors' expectations for them to be regarded as serious work. In the process of putting pieces together to understand how the same and further errors were showing up in such disparate places, evidence of telephone game dynamics showed up. The spread of distortions is outlined below via Figure 1, using the behavior codes in Table 2 to represent specific behaviors.

These dynamics resulted in circulating incorrect answers, incorrect analyses, or incorrect advice. This dissemination system has caused perhaps-unrecognized confusion and in some cases, actual and potential damage to self (e.g., reputation and cost to correct information) and others (e.g., reliance upon incorrect information in writing, advice-giving, or practice). We did due diligence by advising the authors of the several known casualties of this game. This essay is public due diligence, in case others have been confused or damaged along this path or perhaps by playing some other version of the telephone game with developmental theory.[2]

Wilber is not responsible for how other people used, or will use, his figures in *Integral Spirituality* (or in *Integral Vision*). Even so, given the diffusion process portrayed in Figure 1, there is a problem. This is because (a) at least one individual node in the network depicted above used figures from Wilber—which served a limited purpose for Wilber—for much different purposes, based some work on them, and disseminated the work, and (b) others treated that person's work as serious formal work, made the same and in one case further mistakes when relying on it to describe related theory, and passed the results along to others to use. Note that the further mistakes are not specified here because I believe this discussion is sufficient to accomplish stated objectives while keeping all possible identities anonymous.

---

[2] Of course, it should go without saying that any kind of theory, not only developmental, may be subject to erroneous or casual uses.

Figure 1. Depiction of Telephone Games with Developmental Theory

A column in Wilber's (2006) figure 2.4 ended up being *used as if* it portrayed cognitive development and Commons & Richards' developmental framework. The distorted portrayals of cognitive development and Commons & Richards' work resulted in purposes, descriptions, and applications that were well beyond Wilber's purpose for the figures. The pseudo-theory that was disseminated (Figure 1) was practically unrecognizable when compared to Commons & Richards' own formal, empirically-based research and hierarchical complexity theory.

The primary source material of the original authors' work could have been cited in Wilber's figures, and/or a disclaimer or other sort of caveat could have accompanied the figures so people would know they should not rely on them for any purpose other than Wilber's limited purpose for them. If such care had been taken in preparing the figures, perhaps the "originating sentence" in the kick-off game would not have come from his figures at all. Perhaps it would have had Formal Behavior origins and reduced the amount of distortion that is circulating.

Rules of the Reading and Writing Road

I propose some rules of the road to guard against the kind of confusion and damage this case of telephone games illustrates. I recommend these guidelines to those who do not specialize in a particular discipline but wish to use its formal classifications and concepts.

1. Use formal classifications and concepts seriously, befitting the formalities they are.
2. Cite the sources, in writing, of any information you did not personally originate so users can assess the information's reliability.
3. Remember that formal classifications and concepts are unwise fodder for playing the telephone game with reading and writing about theoretical matters.
4. Therefore:
   a) If you are unsure what the formal classifications actually mean, or how they relate to similar classification schemes, consult the primary source or find an expert in that field to ask.
   b) If you do not have formal expertise in the field that produced formal classifications you want to use, ask an expert in that field to review and possibly help you correct your work before you disseminate it.
   c) If you rely upon hearsay, casual work, and/or second, third, or fourth-hand sources for any but the most casual of purposes, realize that this is risky behavior that can cost the loss of credibility and other forms of damage to you and to others.
   d) If you learn that you have made an error in written or spoken information or advice that you disseminated, do whatever you can to correct the error and get the correction into the hands of those who may have relied upon you.

Concrete Ways Forward

In an ideal world, these rules of the road should apply equally to those who read and use information and those who produce information. Taken as a whole, they convey the "value of care." This encompasses both the responsibilities to "let the information-users beware" and to "let the information-providers beware." If left at that, one could walk away with an individualist impression that this is just about taking responsibility for one's own actions. But it is about far more than that, as the following perspectives indicate.

A. Users without expertise in a subject do not have the background to judge the accuracy of information supplied by others on that subject.

B. Providers of information have two responsibilities: (a) to ensure their work is accurate by using standard documentation methods (e.g., citing sources) and obtaining adequate review by competent persons or processes, and (b) to transparently communicate to users the degree of rigor in the preparation and peer review processes applied to a given work.

A1. If earlier users of information (Item A) later become providers of information, and rely on information from other providers as well as themselves, then they become Item B Providers, who have responsibilities to perform the same provider responsibilities.

B1. If providers of information perform both responsibilities, they address the needs of less-qualified consumers to judge the work as reliable. This coordinates the two systems: (A) users' needs and their gaps in expertise to judge quality without supportive information, and (B) information providers' responsibilities for quality, review, and transparent communications.

The foregoing metasystem can be summarized as an integral principle, as follows.

> Neither users nor providers of information should rely upon *only* their own judgment. Each role (user and provider) is responsible to protect itself and others from harm in the course of information exchanges and uses. When implemented, (a) systems for ensuring accuracy and (b) communications *about* the systems for assuring accuracy, together can reduce the frequency and impacts of users and providers acting like independent agents in an interdependent world of information exchange.

If such a principle were adopted as a *Standard Operating Principle (SOP),* the SOP would go beyond current, traditional systems, both formal and casual. As it implies, we need new systems to *augment* traditional ones and accommodate realities of internet-based 21st century information flows. I believe this argument holds true *if* we see merit in implementing such a principle for our own and the greater good. To implement it, however, means developing a new kind of system or systems.

I propose we open discussion about developing an institutionalized approach, a new system, to help accelerate developmental theory's impacts in the 21st century. Such a new system could be a solutions-based way forward, one that respects such realities as this essay highlights:

1. The need for expanded *and* reliable applications of developmental theory by non-experts;
2. The current accountability and communication gaps among people who want to do good work but cannot specialize in developmental theory;
3. The variety of forms and classes of work that developmental theory applications may span;
4. The need for faster tracks to get non-academic work evaluated by competent experts;
5. The need for language consistency in communicating about the levels of rigor employed in work preparation and in evaluative reviews;
6. Perhaps some "good housekeeping seals of approval" to apply to various forms taken by non-academic work with developmental theory.

Ultimately, I believe this is about is developing the mechanisms to support the growing sub-field of *applied developmental theory.* As a starting point to consider such mechanisms, *Integral Review* will open a public forum for discussion of needs identified here and elsewhere.[3] Ideally, it will attract people who are interested to roll up their sleeves to contribute in a variety of ways toward discriminating the range of needs, and conceiving and designing an institutionalized approach to address such needs, including those outlined above. Forum participants could be anyone with an interest, e.g., current or emerging practitioners, academics and other theorists and researchers, or end-users of developmental applications.

---

[3] E.g., in addition to those identified here, see Inglis' essay, this issue: *How then do we choose to live? Facing the climate crisis and seeking "the meta response."*

Reflecting on all of the above, I believe the time has come for an *Institute for Applied Developmental Theory*. I think this idea is worth pursuing and operationalizing. It could be designed to respond to and grow with needs and contexts that are already arising and becoming evident in such organic, unpredictable fashions as this essay portrays. And, at the same time, it could respond to additional needs in fields of endeavor not yet benefiting from insights and applications available from using development theory

Conclusion

Although the catalyst for this essay was the use of information about developmental theory, it applies to all information that relates to or originates in serious theoretical work. I hope that discriminating among the classifications of written work and providing a scheme to organize them proves to be a useful reference. Most of all, I hope the take-away message is that consumers, users, and providers of information all have responsibilities to self and others when information is, or could be perceived to be, anything but casual. When we hold in mind the perspectives and especially the assumptions of others who may use information we generate, we are more likely to follow the rules of the road and attempt to implement integral principles as standard operating principles. One is proposed above; additional principles are possible. May such items inform, support, and motivate us to take the necessary steps to ensure accuracy and credibility for the benefit, not detriment, of all those coming in contact with our work.

As a pragmatist, I do not believe such urgings will have any meaningful impact unless there is an institutionalized method to realize them. To realize them, we need to concretely support people in their endeavors with developmental theory. To concretely, accurately, and effectively support people means putting in place a system to do so.

Creating new systems with high credibility is hard work that requires developing partnerships and human and financial resources. So be it. Let us do what is necessary to help ensure that reliable uses of developmental theory are brought into the 21st century applications that so sorely need them. If we rise to meet this challenge, we will see more developmental theory *effectively applied*, which is what these telephones games have been trying to do, after all. I propose that institutionalizing the sub-field of *applied developmental theory* is a better “game” to play with developmental theory, with better odds than telephone games, yes?

A Transversal Dialogue on Integral Education and Planetary Consciousness

Markus Molz speaks with Jennifer Gidley

Photo by Gary Hampson

Markus and Jenny walking and talking, September 2007 in Luxembourg

***Markus Molz**: Jenny, many thanks for offering your time and insight to the readers of Integral Review. I would suggest to have a couple of e-mail exchanges during the next two weeks or so, unfolding as it will want to go. Your multi-faceted experience and writings make you the perfect partner to get the broad picture of the potential and the challenges of integral education, today and in a historical perspective. Before going into some theoretical considerations, and later into practical questions, let me ask you first why, how and when, biographically, you became interested in connecting those outstanding figures of an integral worldview - Wilber, Gebser, Steiner, and Aurobindo - to each other, and to the concerns of education in our world in profound transformation. This is such a remarkable and demanding endeavour nobody has ever undertaken before, as far as I know.*

SOME RIGHTS RESERVED

Jennifer Gidley: Markus, first let me thank you and the journal *Integral Review* for inviting me to participate in a dialogue with you on integral education. You are interested in why, how and when I became interested in my current research project, which I call "*integration* of integral views". My first involvement with integral philosophies was around thirty years ago when I first encountered Rudolf Steiner's writings. The 1970s were exciting times intellectually and culturally as there was an influx of new ideas and cultural movement. As a young psychologist-educator I was influenced by humanist and transpersonal psychology and particularly by critical pedagogy theories, e.g., Paolo Freire (1970) and Ivan Illich (1975). I was also drawn to various postmodern and feminist philosophers, such as Nietzsche, Foucault and de Beauvoir. There was a powerful shift of consciousness beginning to break into the formal academic world from the periphery at this time. My professional work in educational psychology already focused on the marginal voices. I worked with teachers of young people who did not "fit into" mainstream education, and ran a women's community learning centre empowering "house-bound" women to re-enter employment or tertiary education. I was also beginning to study traditional Eastern spiritual philosophies as a balance to my background.

So when I came to *Steiner education*, in the 1980s, I was already *enacting* critical theory, though with limited conceptual framework for it. As a professional, I was aware of serious limitations of the factory-like model of mainstream education and, as a mother, did not consider it suitable for my children. I decided to found a Steiner school, but sought to transcend the conservative, cobweb-covered, 19th century version of Steiner education (Gidley, 2008a). The school I founded and pioneered for ten years was a contemporary, creative adaptation of Steiner's work (Steiner, 1894/1964, 1901/1973, 1904/1993, 1909/1965, 1932/1966, 1967, 1971, 1981, 1982, 1990) to late 20th century, sub-tropical rural Australia. I was aware intuitively and experientially of what a powerful and positive educational approach this was but was frustrated to realise that it was completely marginalised by the mainstream academy.

In the 1990s I decided to re-enter the academy, with the aim of both testing my intuitions and finding appropriate language to create dialogue between Steiner's integrative pedagogy and the academy. My Masters research indicated that Steiner-educated students, while holding similar fears and concerns about the future to other students, had a stronger sense of empowerment and capacity to envisage positive preferred futures (Gidley, 1998). Over the next ten years I continued to broaden and deepen my reading, researching and writing about educational and youth futures (Gidley & Hampson, 2008; Gidley & Inayatullah, 2002; Inayatullah & Gidley, 2000), post-colonial alternatives to the factory model of schooling (Gidley, 2001a), the impact of globalisation on young people (Gidley, 2001b, 2004), and the evolution of culture and consciousness (Gidley, 2006, 2007a, 2007b). My doctoral research, which I have just completed, is a culmination and maturing of three decades of research and practice in integral forms of education.

This is a rather long answer to your question, Markus, but around 2000, I rediscovered Wilber's writing (1996a, 1996b, 1998, 2000a, 2000b, 2000c, 2001) and found that it really resonated with my internalised Steiner philosophy. The more I read of Wilber the more I was amazed about the similarity between Wilber's ideas and what Steiner was writing a century earlier. I was stunned that in spite of Wilber's claims to be creating an "integral theory of everything" he had pretty much ignored one of the most integral figures of the 20th century —Rudolf Steiner. I decided that I would start a doctoral research project on the relationships between their works. But as I began to follow-up on some of the sources that Wilber referred to, such as Gebser (1949/1985, 1956/1996, 1970/2005, 1972, 1996a, 1996b) and Sri Aurobindo (1909, 1914/2000, 1997), I became drawn into their original writings as well.

As I began to search the literature for others who may have brought these pioneers together academically, I realised that apart from Roland Benedikter's research on Steiner and Wilber (Benedikter, 2005) (most of which is in German) no one else seems to have undertaken any major research project that integrate Steiner's, Gebser's and Wilber's integral contributions. Although I do bring Sri Aurobindo's writing in to some degree, I have not studied his work as intensively as the others, so I am a little more cautious with claims about his work.

MM: *You are mentioning that you were amazed about the similarities you discovered between Wilber's and Steiner's approaches, and you dropped a lot of ink since then to make this evident, including Gebser in the comparison as well. Could you try to summarize where exactly the common ground between these three eminent figures of integral thought can be found according to your research?*

JG: The first thing I need to say as clarification is that the research I have undertaken on the relationship between Steiner's and Wilber's writings is primarily in relation to the evolution of consciousness, with an emphasis on the present and future emergence of a new type of consciousness. Although I started my research as an even broader comparison between them, because of the vastness of their works—especially Steiner's—I decided it was better to focus on this key issue, which I believe is of great relevance for our times and for education in particular. Although I see a lot of other similarities between their works, I have focused my intensive hermeneutic analysis on their evolutionary works. I have then drawn from this analysis to look at the educational imperatives of the evolution of consciousness. But let's put the educational issue aside for a moment until after I have explained my other findings.

My focus on the evolution of consciousness, and particularly the current emergence of a new movement of consciousness led me to a deeper focus on Gebser's work. For Steiner and Wilber, evolution of consciousness was one of several major themes they each wrote about. Gebser on the other hand was a cultural historian whose best known work *The Ever Present Origin* was primarily an elucidation of the unfolding throughout history of five structures of consciousness (archaic, mythic, magic, mental and integral). I felt that it would add to the objectivity and rigour of my research to use Gebser's five structures of consciousness as a third lens from which to view Steiner's and Wilber's narratives, since Gebser had spent almost two decades researching and substantiating his insights. Even though Wilber has compared Gebser's structures of consciousness with his own stages drawn from other literature, he has also misrepresented Gebser's work in some of his later writing, by adding another stage (pluralism) between mental and integral, which Gebser did not use. Because of this and other anomalies in Wilber's work, I decided to go to Gebser's own text so that my "third lens" would be objectively drawn from Gebser's actual writing, not Wilber's interpretation of it.

I developed a long interwoven hermeneutic narrative from the writings of these three "eminent figures of integral thought" as you call them. I have worked very closely with their actual texts to try to arrive at their authentic messages. For those who are interested in more detail this has been published in the previous issue of *Integral Review* (Gidley, 2007b). I will try to briefly summarise here some of the key areas of common ground between the three.

Perhaps the most obvious similarity between their ideas on evolution of consciousness is that they have all put forward a more spiritually oriented view of evolution than the mainstream classical Darwinian view. In this regard all three use the term *involution* as well as *evolution*, which connects their ideas with those of Sri Aurobindo. There are some deep and complex philosophical issues underlying these different evolutionary positions, but the idea of involution—or emanation—goes back at least to Plotinus in the third century CE. From Sri Aurobindo's (1914/2000) perspective the notion of involution—that Spirit or consciousness is primary to matter—is as old as the ancient *Vedas*.

A second similarity between all three is that they all identify previous stages in the development of human consciousness up to the intellectual-mental-rational consciousness that is often regarded today as the highest form of thinking that humans are capable of. This can be equated with Piaget's "formal operations." There are strong convergences in the earlier stages they identify, although Gebser rejects words like "stages" and "levels" because of how they were abused in various hegemonic European grand narratives in his time. Significantly, all three refer to the emergence of a new movement of consciousness, which Steiner called "consciousness soul, or spiritual soul," Gebser called "integral-aperspectival," and Wilber calls by various names such as "integral" "vision-logic" and "centaur." Both Steiner and Gebser claimed that the new consciousness began to emerge in Europe in the 15th century and would continue to gather strength in the 20th century and beyond. This is in agreement with Edgar Morin's idea of the emergence of "planetary consciousness" in the 15th century. Wilber's focus is perhaps more strongly on the postformal and transpersonal psychological models of stage development and his cultural historical detail is less consistent.

MM: *Jenny, can I stop you there for a moment to clarify what you mean that Wilber's "cultural historical detail is less consistent"?*

JG: Yes, sure, Markus. Wilber's cultural historical detail is rather inconsistent if one compares his earlier writing with his later writing. Wilber's focus in his earlier writings (particularly "Wilber II": e.g., *Atman Project* (Wilber, 1996a) and *Up from Eden* (Wilber, 1996b), and some "Wilber IV", e.g., *Sex, Ecology, Spirituality* (Wilber, 2000c)) represents a balance between ontogenetic (individual developmental or Upper Left) and phylogenetic (cultural historical or Lower Left) perspectives. However, from *Integral*

Psychology (Wilber, 2000b) (late “Wilber IV”), he begins to focus more strongly on the postformal and transpersonal psychological models of stage development, drawing on numerous psychological theories which he then compares with the cultural-historical and sociological theories of Gebser, Habermas and others. Because most of the sociocultural evolution theorists he chooses to discuss do not theorise stages beyond formal/modernist or postformal/postmodernist (except for Duane Elgin) Wilber begins to draw more strongly on theories from transpersonal psychology and spiritual development to support his claims for higher cultural stages. Unfortunately because he did not research Steiner’s theories more fully he seems unaware that Steiner was also a socio-cultural macrohistorian who theorised higher/future cultural stages (see Galtung & Inayatullah, 1997). I intend to undertake further research on this area. In *Integral Psychology*, drawing more strongly on the postformal psychology literature, he begins to conflate the developmental psychology stages and Gebser’s cultural historical research. Wilber appears to associate both “pluralisim (early vision-logic)” and “universal integralism (middle to late vision-logic)” with Gebser’s integral-aperspectival structure (Wilber 2000b, pp. 26-27, 167-168). However, in *Integral Spirituality* (Wilber, 2006) (his main “Wilber V” publication), he begins to apply the psychological stages to Gebser’s cultural worldviews, incorrectly attributing to Gebser an additional stage “pluralistic” between “rational” and “integral” (pp. 68-69). This is not correct and thus leads me to conclude that his cultural historical detail is less consistent than his psycho-developmental research. If you are interested, I have discussed these issues in more depth in my article *The Evolution of Consciousness as a Planetary Imperative* (Gidley, 2007b, pp. 100-101, 119-120).

There is so much that emerged from my research that it is difficult to summarise without glossing, which I do not want to do. Some of the common themes in their ideas about the emergent consciousness are that:

1) it integrates previous structures of consciousness;
2) it transcends the dualisms of spirit and matter (e.g. Steiner's spiritual-science), masculine and feminine (e.g., Gebser's integrum), logic and imagination (e.g., Wilber's vision-logic);
3) it has a component of awakening spiritual awareness;
4) it is self-reflective and conscious of its own language, though this is emphasised more strongly by Steiner and Gebser than Wilber.

But this is just a beginning, Markus. One of my interests in this research, as someone who has been working with Steiner's seminal ideas for decades, is why Steiner's major contributions to so many fields has been so ignored—not only in the mainstream academy, but also in much of integral theory. Some of the fascinating things that I have discovered about Steiner's contribution to this discourse are that he began to speak and write about the evolution of consciousness as early as 1904 (ten years before Sri Aurobindo, decades before Gebser and Teilhard de Chardin, and almost a century before Wilber). Steiner was also using the term integral in a similar way to Sri Aurobindo and Gebser long before the others. For example, he was writing about "integral evolution" compared with "Darwinian evolution" as early as 1906. Ironically, none of this outstanding contribution appears in the integral canon developed by Wilber. By contrast, Steiner's significant contribution has been acknowledged in the theorising of integral philosophers from the California Institute of Integral Studies (McDermott, 1996, 2001; Tarnas, 1991). I have discussed these findings in more detail in my doctoral dissertation (Gidley, 2008b).

Finally, as I have no interest in taking a syncretic approach, which only synthesises the similarities between them in some kind of new universalising meta-narrative, I have also focused on their differences—the particularities in their views and approaches (Gidley, 2007b).

MM: *I wouldn't go deeper into the differences between Wilber, Steiner and Gebser in this dialogue, even if we agree that we should always consider similarities and differences together. It would take another dialogue to dive into this. Rather, I would like to turn now to educational practice and ask you whether you think that the cross-validation of the similarities between these authors gives a new impulse to educational reform engaged with what you call the factory model of mainstream education?*

JG: Markus, we have hit upon a very complex issue here. Yet to put it simply, my integration of integral research on the evolution of consciousness strengthened my intuition that education urgently needs to evolve. This would be in keeping with the emergent changes in consciousness that are generally referred to as postformal, integral and/or planetary.

There are a number of threads that play into the multifaceted tapestry that I have been identifying, if education as a whole is to become responsive to the significant implications of the evolution of consciousness. Factors that need to be considered include at least historical, geographic and developmental levels of education.

In terms of geographic, I have not studied in depth the history of education in non-western geographies, so my comments are primarily in reference to European developments, which have been picked up in the Anglo-speaking world. These developments have subsequently influenced the current globalising agenda to introduce what I call the "factory model of education" to the rest of the world, particularly via the World Bank's "Education for All" agenda (Gidley, 2001a). In relation to levels of education most of my research has been related to school education although the evolutionary imperative also applies to higher education as I have also indicated (Gidley, 2006). I will not discuss this here as it is particularly complex when one begins to take into account Indian, Chinese, Arab/Islamic and Israeli streams of higher education—all of which arguably preceded the European academies and universities.

In terms of historical perspectives on school education, I have identified three broad phases in my research: 1) "informal education" via family/tribal enculturation, elite tutoring, and private religious schooling, prior to the beginnings of mass public education approximately two hundred years ago; 2) "formal school education," from late 18th to 20th centuries in Europe, USA and increasingly in other parts of the world last century; and 3) what I am referring to as "a diversity of postformal pedagogies," beginning in the late 20th century and—one would hope—flourishing throughout the 21st century and beyond.

Prior to the Industrial Revolution, which embedded modernist ideas into the socio-cultural fabric of Western society, education for children was not such a formal process, even in the Western world. Children were enculturated by their extended families and cultures and only the children of the wealthy—who could afford private tutors—or who wished to become clerics, had any 'formal' education (Holborn, 1964). Earlier integrally-inspired educational reform had been initiated in the 17th century by Moravian educational theorist Johann Ámos Komenský (more frequently called by his Latin name Comenius) who wrote the influential *Didactica Magna*, which proposed a three tier universal schooling system for all children (Dahlin, 2006). Subsequently in Germany, the notion of the evolution of consciousness, which was a major contribution of German idealists and romantics such as Goethe, Hegel, Schelling and Novalis, contributed to the initial impulse for mass public school education, which began in Germany in the late 18th century. This was carried forward particularly through Schiller's aesthetic educational principles (Schiller, 1954/1977), Herbart's integrative pedagogical system (Klein, 2006) and Humboldt's implementation of public education (Holborn, 1964). However, after the deaths of these leading German philosophers, by the middle of the 19th century the idealist-romantic educational project was largely hijacked in Western Europe by the gradual influence of the British Industrial Revolution, so that schools increasingly became training grounds to provide fodder for the factories. This factory model of school education was picked up in the USA around one hundred and fifty years ago (Dator, 2000).

MM: *This long-term historical contextualisation seems quite important to me because we often remain caught in our day-to-day business. It shows that the invention of the modern school is linked to complex interactions between certain philosophical worldviews, the formation of nation-states, industrialisation (and secularisation). The specific mix and phasing between these ingredients has actually been somehow different in different countries, but the result at latest in the 20th century was very much comparable all over the place: a public compulsory school system with different types of schools. It seemed to be useful to a certain degree and represent an adaptive advantage, in the framework of such an overall societal configuration. But today we have a pretty much different situation. We might come back to this question later.*

The educational systems grew and grew throughout the 20th century almost everywhere with regard to the allocated resources, the number of teachers, pupils and students, degrees delivered and so on. Illich’s (1975) profound criticism back in the 1970’s was basically that such a system will never deliver on its promises, that it will necessarily contribute to produce social exclusion and deepen the dependence on so-called educational experts. A decade ago or so the former French minister of education Claude Allègre claimed, much more pragmatically and without questioning schooling as such, that “it is necessary to trim the fat of the mammoth”. This became a very famous, often repeated phrase in order to criticize the state bureaucracy built to manage and control the educational system.

Despite various kinds of partly divergent, partly convergent criticism the educational mammoths seem well and alive until today, viewed from the quantitative perspective. This holds true even after the neo-liberal fat reduction cures preceded here and there, even if they have caused upheavals among teachers, parents and students because of worsening conditions for teaching and learning in the era of mass education. At the same time and based on the same ideology the new public governance models floated into the educational systems conveying more autonomy to individual schools in a whole array of countries and regions. So, none of these unfolding steps can be painted in black and white alone. But despite such never ending waves of educational reforms, little qualitative, transformative change seems to occur in these educational systems as a whole, after all.

JG: I have begun to use the phrase "evolving education" as an alternative to "educational reform" or even "educational transformation." This is because I want to highlight the scope of the transition we, as humans in a planetary age, are undergoing. The notion of "educational reform" very often only tinkers at the surface of appearances—a bit like rearranging the deckchairs on the Titanic. While the notion of "educational transformation" potentially goes further than "reform," it can be limited by the philosophical perspective—or even ideology—that it subscribes to. The meaning that I ascribe to my notion of "evolving education" is one that connects education more consciously with the evolution of new patterns of thinking that appear in so many disciplines and fields throughout the 20th century. These new patterns of thinking are often referred to collectively as the “evolution of consciousness” and can be observed in:

- the transition from Newtonian mechanical physics to Einstein's relativity and quantum physics;
- the transition from classical biology, including Darwin's theories of evolution to the new biology’s, such as chaos and complexity theory, self-organisation and emergence;
- the philosophical transition from modernism to postmodernism and poststructuralism;
- the transition from disciplinary to multi-, inter-, post- and transdisciplinary;
- the emergence of new rational discourses on spirituality not limited by religious doctrines;
- the transition from studying the past to an awareness of the value of foresight and futures thinking, in parallel, paradoxically, with the deconstruction of the modernist, linear narrative of time.

The research in all of these areas has increased dramatically in the last 40 years, and more so in the last decade and has very significant implications for education. My research creates conceptual links between all these changes and the need for the transition from formal, factory-model schooling and university education to a plurality of postformal pedagogies (Gidley, submitted).

MM: *You just took great care to reframe my initial question, historically and terminologically. This is quite helpful. I agree completely with you that we should consider the current challenges to the late factory model of schooling and the upcoming* *horizons of integral education taken together, dialectically, as one of the very very few major transitions in the cultural evolution of education. The other day, however, I listened to a presentation of an educational researcher (Tröhler, 2007) based on his ongoing empirical research on school curricula in different European countries throughout the last two hundred years. One of Daniel's main claims was that the fundamental grammar of schooling (Tylack & Tobin, 1994) in the basically national educational systems, i.e. a curriculum based on small recurrent set of separate subject matters taught in uniform fixed time slots to age homogeneous groups, has proven to be almost completely resistant to change underneath the continuous cycles of surface reforms. According to these results, he told his audience as a conclusion, it is unwarranted to believe in the very possibility to change educational systems substantially and that there is some good to this. Do you think this claim is a realistic position or does it lack this long-term perspective of cultural evolution and evolution of consciousness with major leaps occurring across societal sectors once in a while?*

JG: Yes Markus, the institution of mass public education has been pretty static since its inception two hundred years ago. But I think I am a bit more of an optimist than that. Firstly, I find it helpful to view education in its broader cultural context, as only one of the types of enculturation that cultures provide for their young people. I have recently begun to look at the evolution of education in the context of Foucault's archaeological concepts of *connaissance* in relation to the institution of education, and *savoir* for the broader cultural context or worldview (Scheurich & McKenzie, 2005). This gives me some hope as I believe it is inevitable that the institution of education (that is, schools, colleges and universities) will evolve as the cultural milieu evolves. This is why I have shifted the emphasis of my own thinking and research, from my earlier focus on the futures of education per se, to my current broader focus on evolution of consciousness. My understanding of the situation is that there will be no substantial change to the system and institution of education without a change to the way we think and view the world. That is why I have taken such an interest in creating conceptual bridges between the evolution of consciousness discourse, particularly the integral evolutionary views of Steiner, Gebser and Wilber, and the education discourse.

I have also discussed elsewhere that in addition to the various integral approaches, there is evidence to support the evolution of consciousness from the adult developmental psychology research on postformal reasoning (Bassett, 2005; M. Commons et al., 1990; M. L. Commons & Richards, 2002; Cowan & Todorovic, 2005; Kohlberg, 1990; Labouvie-Vief, 1992; Sinnott, 1998, 2005; Torbert, 2004), and also from the eco-philosophical literature on planetary consciousness (Benedikter, 2007; Earley, 1997; Elgin, 1997; Gangadean, 2006; László, 2006; Montuori, 1999; Morin & Kern, 1999; Nicolescu, 2002; Russell, 2000; Swimme & Tucker, 2006).

I have scanned the educational literature (NB: I am "language challenged" and limited to Anglophone literature) for signs of emerging pedagogies that are reflecting one or more of the features of postformal, integral or planetary consciousness. I have to say that there is a lot of encouraging material being written about new educational approaches in the last decade. There is also a very powerful neo-fundamentalist backlash in the Anglo countries from government-backed educrats who seek to dominate the educational agenda with scientism, economism and technicism—through the "audit culture." On the other hand there are also several educational theorists and researchers who are attempting to expose and counter this reactionary neo-conservatism (Abbs, 2003; Coryn, Schröter, & Scriven, 2005; Denzin, 2005; MacLure, 2006).

MM: *Of course. But despite the fact that Daniel Tröhler agreed with me that alternative schools do co-exist with the mainstream system in many countries, he argued that these schools never spread enough, and their educational approaches never gained enough influence to challenge the hegemony of the traditional grammar of schooling. Factually this is true in most countries to date. How would you counter his argument keeping in mind that there are a great many children, youth and adults yearning for learning environments fundamentally different from the factory model?*

JG: I think we are experiencing what I would call a *third wave* of educational impulses to evolve education since the beginning of the 20th century. Although much of European and Anglo education did lose its initial idealist/romantic impulse during the 19th century, and succumbed to the weight of industrialism and secularism, new threads began to emerge in various parts of the world in the early 20th century. We had Montessori and Steiner in Europe, Whitehead in the UK, Dewey in the USA and Sri Aurobindo in India all pioneering more integral, organic educational approaches that provided a counter-weight to the factory model. They emphasised imagination, aesthetics, organic thinking, practical engagement, creativity, spirituality, and other features that reflect the emergent integral consciousness. However, as you say these approaches have mostly remained marginalised, or in the case of Dewey's initiative, been appropriated in a reduced form by the mainstream system as so called "progressive education."

What I call the *second wave* was sparked by the dramatic consciousness changes that began in 1968 with the student protests in Paris, followed rapidly by the 1969 Woodstock Peace Festival in the USA, which laid foundations for a youth peace movement against the Vietnam War. These events arguably marked the beginning of various "new age" movements, including participatory politics, new forms of music, east-west spiritual-philosophical dialogues, new gender relations, post-nuclear family lifestyles and recreational use of drugs. These movements were taken up quite strongly in the Anglo countries, particularly in pockets of the US and, at least indirectly, began to shift ideas about formal education. The 1970s to 1990s saw a broadening of alternative educational modes, including home-schooling (Holt, 1970), holistic education (J. Miller, 1990; R. Miller, 1999, 2000), critical pedagogy (Freire, 1970; Illich, 1975), futures education (Fien, 1998; Gough, 1989; Hicks, 1998; Rogers, 1998; Slaughter, 1989), and a raft of educational reforms within mainstream settings. All were critical of the formal, modernist 'factory-model' of mass education. Most sought to broaden education beyond the simple information-processing model based on a mechanistic view of the human being to a more holistic, creative, multifaceted, embodied and participatory approach. Yet not all honour the spiritual needs or the multi-layered nature of the developing child, as part of a consciously evolving human species. Furthermore, these approaches are still minor threads and unfortunately most approaches are also isolationist in relation to each other.

This brings us to what I would call the *third wave* approaches to evolving education reflected in the plethora of new "*post*formal pedagogies" which have emerged, particularly over the last decade. Some of these aim to—or at least claim to—integrate all previous approaches.

MM: *How then could integral and transdisciplinary ideas and practices for education have a greater impact on the grammar of schooling—Goliath as, historically, the alternative pedagogies and educational reform approaches have had? Which ones most probably?*

JG: There are several different approaches to integral theory—and thus to integral education—that I have identified and perhaps we need to identify those before we go any further. In my doctoral research I have proposed a new frame through which to view the complementary nature of several significant integral theorists (Gidley, 2008b). For the purposes of this delicate theorising I focused on five integral theorists: Gebser, László, Sri Aurobindo, Steiner and Wilber; and two transdisciplinary theorists: Edgar Morin and Basarab Nicolescu. My framing includes several metaphoric perspectives, introducing five—mostly new—terms to integral theory: *macro-integral*, *meso-integral*, *micro-integral, participatory-integral,* and *transversal-integral.* I can only briefly summarise them here.

By *macro-integral* I am referring to the extent to which the integral theorist includes all major fields of knowledge. I suggest that at this macro-layer of conceptual integration, Wilber's AQAL framework makes a highly significant contribution and this is where his strength lies (Wilber, 2000a, 2004). While Steiner and Gebser are also macro-integral theorists, their work has been seriously marginalised in this area.

By *meso-integral* I am referring to the extent to which the integral theorist contributes significantly to theory building within particular fields or theories. I propose that Ervin László's contribution is highly significant in this domain (László, 2007). Sri Aurobindo's integral approach could also be regarded as a significant contribution, albeit also a marginalised one, given that his philosophy provides a foundation for much of the later integral theory development.

By *micro-integral* I am referring to the extent to which the integral theorist makes detailed contributions to specific disciplines or fields through the *application* of their integral theory. In this domain of detailed application of integral theory to a wide range of disciplines and professional fields, Steiner's extraordinary contribution can no longer continue to be ignored by integral theorists.

The notion of *participatory-integral* is based on the integral transformative education theory of Jorge Ferrer (Ferrer, Romero, & Albareda, 2005) whose participatory approach is inspired by Sri Aurobindo's integration of the three yogas of *knowledge, love and action*, which is in turn aligned to Steiner's *thinking/head, feeling/heart* and *willing/hands.*

Finally, I propose a new concept via the term *transversal-integral* that refers to integral approaches that include and cut across these vertical and horizontal levels/dimensions. From my planetary scanning of the research it is apparent that the term *integral* is much more widely used in North America than in Europe. By contrast the term *transdisciplinary* appears to be used in Europe, particularly by Nicolescu and Morin, with similar integral intent (Morin, 2001; Morin & Kern, 1999; Nicolescu, 2002, n. d.). Morin and Nicolescu do not tend to use the term *integral*, nor are they cited as integral theorists in much of the integral literature. I suggest this is an unfortunate oversight based on semantic and cultural misunderstanding, rather than philosophical understanding. A special feature of both Nicolescu's and Morin's transdisciplinary, planetary philosophies is their attention to *transversal* relationships—hence my new term *transversal-integral*, which allows for their seminal writings to be included as part of a transnational, integral theory.

MM: *You are right: there are a lot of writings not self-categorizing as integral while being a manifestation of the "integral" wave of consciousness. I would add Roy Bhaskar here (Bhaskar 2002a, and 2002b with a chapter on "educating the educators - or empowering teachers"). The complex history of all those approaches has still to be written, but even if we are yet lacking a scholarly approach to this history it is up to us not to remain stuck in one of them, and to take care to find out about their specific strengths and weaknesses.*

I am pleased that you mention Morin and Nicolescu. I have been living in France for a couple of years, a place where Wilber is almost unknown because none of his recent books has been translated into French to date, whereas Morin is a kind of a national monument publishing books since 1946 straight ahead until now, and he is still appearing frequently on TV shows, in the radio and in newspapers. The influence of Morin spreads quite impressively across the Roman language countries in Europe and the Americas. Further research is likely to uncover preferential cultural-linguistic influence spheres of different integral and transdisciplinary authors.

Interestingly, like Steiner and Sri Aurobindo/The Mother, while promoting overarching and cross-cutting approaches, Morin and Nicolescu, have specifically talked and written about education (Morin, 2001, 2008; Nicolescu, 1997, 2005, 2008, n.d.). Their intention is precisely to trigger new educational structures and approaches and not only to contribute new content to be learnt in the old system. Two years ago the fully-fledged university intentionally called rather real life multiversity (precisely "La multiversidad Mundo Real Edgar Morin") has been founded in Mexico with the help of a generous donor according to Morin's educational imperatives. By the way, this university is hosting an international congress on complex thought and education later this year where Morin and Nicolescu will give the keynotes.

In Wilber's work, however, as prolific a writer as he is and in spite of how many fields he is touching and connecting, education is one of the most neglected topics until today. Other authors have started to draw on the AQAL model to think more integrally about education, and some of them have their own gathering this summer in the United States, "exploring the leading edge of education theory and practice". This is valuable, of *course, but I guess the leading edge can only truly be explored in its manifold forms and places of manifestation taken together.*

The existing parallel universes of these many self-declared leading edges appear as curious to me as they do to you. At least, I am not aware of any intentional cross-connection between them besides very first timid attempts here in Integral Review. And there are still many many other relevant strands out there never mentioned together while sharing much of their goals and values. In order to illustrate this claim just let me take me some arbitrary examples from my much more extensive list.

There is the neo-humanist education tradition inspired by Prabhat Rainjan Sarkar (1998, Inayatullah et al, 2006) and their schools and training institutes all over the world, the global network developed by the Shapers of Education International Foundation based in the Netherlands and coordinated by Charlotte Korbee, the international UNIPAZ network inspired by Pierre Weil in Brazil deploying their holistic peace education programme in various places, or the shots of such singular figures as Steven Harrison (2002), co-founder of the Living School in Boulder as a real life example. By the way Steven has been literally a neighbour of Ken Wilber there for years. Did they ever meet? I don't know.

In the end, they all seem to have their very own publications, supporter's network, projects, trainings, meetings and conferences. This state of affairs is profoundly self-contradictory with regard to the integral and transdisciplinary programmatic stance to integrate knowledge and practices from all kind of sources regardless their cultural origins and paradigmatic traditions. It's even more self-contradictory because the movements I just mentioned, as those you have mentioned - Steiner's most strongly - have already developed at a global scale. As a summary we must state that we are witnessing today a major inconsistency in the deployment of integral and transdisciplinary educational thought and practice: geographically it seems to be already rather globalised (with some differential distribution though as mentioned before), and paradigmatically it seems to be rather fragmented - at the same time! If we finally decide to take the core role of education for the inevitable societal macroshift towards global sustainable development seriously then we simply cannot afford any longer this state of affairs.

JG: Well, Markus, I am enjoying this *dialogue* as I can see how aligned our passions are to try to develop a broader, more embracing approach to *integral education*. I am very interested to hear about Morin's multiversity in Mexico and the conference there. I have also, for your interest looked a little bit into the relationships among Sarker's neo-humanist education and Steiner's and Wilber's approaches for a conference presentation in Taiwan a couple of years ago (Gidley, 2005). That reminds me, there is an interesting integral education project in China also, initiated by Professor Fan Yihong, who previously studied in collaboration with David Scott's *Community for Integrative Learning and Action* (CILA) in Amherst, Massachusetts (Yihong, 2002, 2005). I also agree that *Integral Review* is playing a very significant role in providing a scholarly forum for dialogue among the diverse integral and transdisciplinary philosophical and pedagogical streams.

There are two major approaches that are identified as "integral education" in North America—integral education based on Sri Aurobindo's early 20th century philosophy (for example, as reflected in the *California Institute of Integral Studies*) and integral education based on Ken Wilber's AQAL framework. There was a double special issue of *ReVision: The Journal of Consciousness and Change* on "integral education" in 2005 and 2006, which was quite strongly influenced by Sri Aurobindo's approach to integral (with some exceptions). It is worth following up for those interested. The following year, 2007, there was a special issue of Wilber's *AQAL: Journal of Integral Theory and Practice* on "integral education," which was primarily based on Wilber's theories. Although Wilber's theory espouses to “transcend *and* include” other approaches, I was disappointed in some of these articles for their lack of scholarly research on other neighbouring pedagogies, even other integral approaches (Crittendon, 2007; Zeitler, 2007). Such a technicist and uncritical approach to applying the AQAL model does not, in my opinion, reflect a fully integral approach nor does it forward the academic reception of integral education theory.

One of my concerns is that integral theory creation to date has been seriously hampered by internal rivalry, factionalism and, ironically, lack of integration of neighbouring perspectives. This also applies so far to the two major “integral education” approaches in North America: Sri Aurobindo's and Wilber's. In my research I identify a third major integral education approach: Steiner/Waldorf education. As part of my *integration* of integrals, I undertook an AQAL analysis of Steiner education and found that it fulfilled all the criteria of Wilber’s Integral Operating System (quadrants, level, lines, states and types). This analysis can be found in *Educational Imperatives of the Evolution of Consciousness: The Integral Visions of Rudolf Steiner and Ken Wilber* (Gidley, 2007a). In the light of this analysis it is clearly important that Steiner pedagogy be given more serious consideration by AQAL-oriented integral education theorists, who so far have had little to say on school education. Furthermore, the emphasis in Steiner pedagogy on integrating *thinking/head, feeling/heart* and *willing/hands* is significantly aligned to Sri Aurobindo's integration of the three yogas of *knowledge, love and action.* It is important that integrally-minded educators give serious consideration to these and other existing approaches.

In my view, an authentically integral education would embrace the rich diversity of postformal and planetary pedagogical approaches that are out there, globally, in these urgent planetary times. It would also learn from pioneering integral approaches to education, such as Steiner pedagogy that has been operating globally, with a conscious intention towards the evolution of consciousness and higher order thinking for almost eighty years. It is ironic that integral educators such as Robert McDermott (2005) and Alfonso Montuori (1997, 2006), and holistic educators such as Ron Miller (2000, 2005, 2006) and Tobin Hart (2001a, 2001b) appear to have done more thorough research on the alternative approaches than have most of the educational writers in the AQAL Journal. Ron Miller's holistic educational philosophy seems the broadest and includes Steiner's, Montessori's and Sri Aurobindo's pedagogies as well as Wilber's integral as significant integrative approaches to be considered (Miller, 1990, 1999). Current research is also underway to extend integral education theory through considering indigenous perspectives, the history of the university, the development of different sciences, and “integral education” in nineteenth century Europe (Hampson, Forthcoming).

To me the call for integral education theory is to contextualise itself academically in the long history of integral philosophies, east and west, and to contextualise itself geographically within transnational, transcultural, planetary discourses that go beyond the Anglo-American integral discourse.

MM: *As a European working in a multilingual country in two other languages besides English I can systematically state the lack of consideration and integration of material not translated into English on - what is somehow quickly called - the “international level”. Particularly in the field of educational research, because of the nation-state boundness of the public educational systems, the papers and books produced in the national languages represent still the major part of the overall research output in this field, at least in the larger countries. As far as my observation goes the upcoming field of integral education cannot claim to be an exception. Existing books and papers are generally not translated. If this holds true already between the Anglosaxon world and continental Europe, both being parts of the dominant “North Atlantic belt”, the one-way ignorance with regard to other parts of the world is necessarily even more pronounced. This structural imbalance is a major barrier to developing those transnational dialogues on integral education and planetary consciousness you are rightly putting on the agenda. In this context, and because you started with mentioning special issues, I would like to add the 2005 special issue on transdisciplinary education of the Rencontres Transdisciplinaires, which is the journal of Nicolescu’s International (!) Center for Transdisciplinary Research (the major part of the 17 contributions are in French, a few are in English).*

JG: Thanks Markus. It sounds like there is a great need for some funding for cross-lingual translation of emerging integral pedagogical literature. I think that the strengthening of multilingualism is crucial in the advancement of transnational dialogue to further the emergence of planetary consciousness.

In addition, I have identified over a dozen emerging pedagogical approaches that in some way, either directly or indirectly, facilitate the evolution of postformal-integral-planetary consciousness. I have begun the process of hermeneutic dialogue among them, but of course much more research needs to be done. These include: aesthetic and artistic education; complexity in education; critical and postcolonial pedagogies; environmental/ecological education; futures education; holistic education; imagination and creativity in education; integral education; planetary/global education; postformality in education; postmodern and poststructuralist pedagogies; spirituality in education; transformative education; wisdom in education. These are all part of what I am calling the *third wave* of educational evolution. It is too much detail for this interview to list all the many references that relate to these approaches, but I have explored this literature in detail elsewhere, including how these new pedagogies intersect with four themes that I identified in the evolution of consciousness discourse (Gidley, submitted). As you can see this is a complex area and it is certainly not a simple matter of applying one brand of integral theory to education as some kind of "universal fix-it all."

MM: *In this field there is definitely enough work to do for dozens of Ph.D. students. And I completely agree with you that we cannot stress enough the importance to intentionally cross the boundaries of cultures, languages, conceptual frameworks and prototypes of educational practices. Planetary consciousness cannot reasonably be promoted as an educational goal, if educational theorists do not, themselves, enact practices of learning about and integrating third wave educational discourses worldwide. Besides these important scholarly issues, where precisely do you see fields for promising action and reflection for integrally minded educators without fighting like Don Quichotte and becoming exhausted and frustrated?*

JG: I think that we are really in the very early stages of integral consciousness being embodied in the world. Because of this, integral education is very much in its infancy. You ask how integrally minded educators may contribute to the bigger quest of transforming or even evolving education on a planetary scale, without becoming exhausted and frustrated. I was speaking recently to one of my futurist friends about how frustrating it is that even though there are all these amazing initiatives going on in the world that are trying to change things for the better, the weight of the status quo seems to resist it at every turn. His response was that the very pluralism of the change initiatives works against them, whereas among conservatives there is a unity of perspective: they all want the same thing—they don't want change! To me the only way that integrally minded educators can muster enough strength to enact the kind of meta-change that is required is to dialogue, dialogue, dialogue. Only by enacting conversations among the rich pluralism of postformal, integral, planetary pedagogies will we begin to have an adequate picture of the rich tapestry of evolutionary change that is already happening before our very eyes.

My research interest has been to identify and cohere what Nicolescu calls the "luxuriance of the plural" when it comes to educational approaches. By bringing them into relationship with each other we no longer have one "integral education brand"—whether it be Wilber's or Sri Aurobindo's or any other—but rather a *unitas multiplex* of postformal-integral-planetary approaches that can learn from each other, inspire each other and give strength to each other. This is what *evolving education* means to me.

MM: *We talked quite extensively now about the horizons of the third wave of educational approaches. You mentioned as well that seeds of this latest wave have been somehow present already inside the first wave and then partly forgotten or marginalized. If integral means to acknowledge and to value the positive and productive aspects of all unfolding waves, let me ask you, finally, which aspects of the traditional model of compulsory schooling are good, efficient and helpful and need to be preserved in a larger, integral embrace?*

JG: Markus, I think there is a danger in creating a polarising narrative between the traditional model of education and an integral approach, or even as Sean Esbjörn-Hargens

(2006) suggests a three-type model of traditional, alternative and integral/AQAL. There is no doubt that the model of mass public school education that developed during the industrial era has delivered many benefits in the past both for individuals and for society. There is no question that there have been enormous social benefits for multitudes of young people who would not have had access to any formal education in the pre-modern era where school education was only available to the elite. My intention in using the metaphor of "factory" in relation to schooling is to highlight the industrial era underpinning of the schooling model that has become the myth-of-the-given, in order to beg the question as to whether that still needs to be the dominant metaphor in a post-industrial, planetary era. In a post-Newtonian, post-mechanistic, post-industrial integral age what new metaphors may be more suitable? The garden model perhaps? Or the forest model? Or even the extended family model? We need to think very carefully and creatively about the deep metaphors that underlie how we think about education. But this would be the subject of another discussion perhaps.

On the other hand if by the traditional model we mean the original model of universal and free public education proposed by Comenius in the 17th century and initiated by Humboldt in Germany two hundred years ago, then I think there is a lot to be gained from a careful historical study of this early pedagogy. Gary Hampson's research is relevant in this regard (Hampson, forthcoming). After all, this model was first inspired by the unitive spiritual humanism of Comenius and later by the German idealist and romantic philosophers who were far more integrally aware than many of the educrats who have been writing national curricula in the world for the past hundred years. Some of the original inspirations included the head, heart and hands approach of Pestalozzi, the integrative interdisciplinary pedagogy of Herbart, the aesthetic educational approach of Schiller and the future orientation of Novalis. Although I have talked quite a lot about the factory model of education myself, upon reflection, I think the more we forget about models altogether and create living approaches that breathe with their local/global environment the more quickly the *connaissance* of institutional education will become imbued with the evolving *savoir*.

MM: *Jenny, this seems to me a perfect remark for bracketing our stimulating discussion. I must say that I terribly enjoyed the cycle of learning throughout this interview ending up here with questioning and dissolving some conceptual distinctions we used initially to make our way through the complexity of the topic. I think this is a good example of how to practice a kind of awareness, which is absolutely crucial to learning. Each and every concept or model (as set of interrelated concepts) we might ever use is opening up and hiding away something at the same time.*

As synchronicity goes, while conducting this interview with you, I finally received the book of Johan Galtung and Sohail Inayatullah (1997) on macrohistory and macrohistorians I ordered a long time ago. In the domain of macrohistory Sohail - with whom you have published a book on the university in transformation – (Inayatullah & Gidley, 2000) and his co-authors (among them the presencing Otto Scharmer) pursue a similar attempt to the one you are pushing forward in the field of evolution of consciousness and education, i.e. stimulating cross-fertilization between vanguard *thinkers, for the sake of transversal-integral horizons of thought and practice. So, to wrap it all up, let me take some short quotes from the macrohistory-book, which are resonating pretty well, I think, with your approach to evolving education.*

All these "metaphors create worlds: They fix stages, entrances and exits. Then we can ask if there are ways to transcend these worlds our words have created" (p. 160). All these models "will be seen as inspiring and important except when or if people really start believing in them ... From this point on they become dangerous ..." (p. 203). All these authors "have insights, but they are in no way infallible guides; certainly not singly, but not combined either. Eventually, we are to live in the future - only then will we know" (p. 243).

Thank you so much, Jenny, for having taken so much time for chewing rather than eschewing my questions, many of them difficult to answer, I admit! I am looking very much forward to pursuing and deepening this dialogue on other occasions.

JG: It has been my pleasure to engage in this dialogue with you, Markus.

His doctorate is about meta-theories on culture(s) and consciousness and their relevance for new approaches to learning and research.* Email: presence@gmx.org

An Approach to Integral Consciousness and Politics: An Interview with Steve McIntosh

(Author of *Integral Consciousness* and CEO of Zen and Now)

Russ Volckmann

I first came across Steve McIntosh's name as the author of the book Integral Consciousness and the Future of Evolution: How the Integral Worldview is Transforming Politics, Culture and Spirituality. *Here was a work that linked integral theory to the idea of worldview, evolution, politics and culture, even spirituality. What a bonanza!*

I was intrigued to discover that McIntosh is the Founder and CEO of the company, Zen and Now, designers and distributors of clocks, timers and other products using natural acoustic sounds and natural hardwood materials. I am always interested in how business leaders are attracted to and using integral approaches to their work. In McIntosh's case, as an entrepreneur and executive, the book was a bonus for interviewing him for the Integral Leadership Review (March 2008). In that interview our focus was very much on his business and his role. When it was completed, I felt that there was still a lot more valuable ground to explore and invited McIntosh to participate in a second interview that would focus more on his perspective on integral theory and its implications.

In the book, he builds on the work of Ken Wilber, Spiral Dynamics® and other philosophies, theories and models, while offering some critiques that show that he, too, might stake his claim to be viewed as a philosopher in his own right. Here is a sample of the perspective he brings,

> I have a direct personal experience of integral consciousness, and thus I know that it is a historically significant new level because I can see how extremely useful it is. Yet integral consciousness is more than just a tool for problem solving; it's an identity-providing platform for cultural allegiance, a worldview that invites our passion and our loyalty. As integral practitioners we have to see ourselves as ambassadors of the future.

I wanted to learn more about this passion and its nuances. To begin with, I came to understand that much of work on theory and research and application is about the future, is about a creative process and thereby brings meaning to our work. I wanted to learn more about an approach that allows us to use more integrative approaches. I wanted to discover the potential for such approaches to bring different paths to engaging the challenges we face on so many levels of our—and the world's—existence. This interview is the result.

— Russ Volckmann

RUSS: *Steve, it seems to me that a critical foundational piece in your work has to do with the idea of the dialectic, whether we're talking about a Hegelian dialectic or a Gravesian developmental dialectic. Would you comment on that?*

STEVE: Sure. Integral philosophy is primarily a philosophy of evolution. And as we come to better see and understand evolution, when we see it in cosmology, biology, consciousness and culture, we can begin to detect certain things about the overarching master system of evolution, or how evolution works overall, especially in the realm of consciousness and culture. This reveals the process that is being enacted by evolution. And it exists across scale; that is, it is a process of development that acts at the micro and macro levels of development. Of course, this process is the well-known dialectic of development.

The term "dialectic" can be found in Ancient Greek philosophy, where it was more about a dialogue between people. However, since Hegel, the dialectic has been understood as a process whereby conflicting systems overcome themselves through a kind of transcendent synthesis. Most people are familiar with the terms "thesis," "antithesis" and "synthesis." But those terms have been criticized as a kind of vulgarization of the dialectic. There is a danger when you break this process down into its parts that you could lose the essential truth of the dialectic—that it is more of an integrated process as a whole rather than a series of steps.

However, seeing a moving process as a series of steps can be helpful in understanding the process. For example, until motion picture film was invented people didn't understand how horses ran in terms of the order that they put their feet down. But when they first filmed horses running, they were able to look at the frozen frames of their feet, so they began to understand how horses ran because they could see it in stopped motion. So understanding the dialectic in terms of "thesis," "antithesis" and "synthesis" is a useful construct; it allows us to see how the horse runs, if you will, and it gives us a snapshot of this moving system. As long as we keep in mind that the dialectic of development is this process by which the universe develops and greater degrees of complexity and integration are achieved, we can see that this process of dialectical development has discrete elements, but we don't lose sight of the fact that it's a moving system as a whole.

Q: *As I think of the evolutionary perspective in your writing and in the notion of the dialectic, I see an optimistic way of viewing life. There is movement and change towards some higher stage, whether it's higher levels of complexity and capacity to engage complexity or whatever it might be. One of my favorite authors—someone who has influenced me considerably over the years—is Charles Hampden-Turner. He put together a model of psycho-social development back in the late 60's, early 70's that is a dialectic and involves interactions between two people (or groups). In addition to the dialectic developmental model, he offers an anomic model—going up and going down—showing that there are processes of disintegration and integration. I did find reference to regression in your writing, but I never got an understanding as to whether you see us as being in a continuous progressive process, or whether there is something more complex going on.*

A: Certainly, if you just look at the evolutionary record, regression, stagnation—these things are always a possibility. Evolution is never simply a unilinear advance towards greater perfection. Sometimes we definitely have to go backwards. Whether this is built into the system with some kind of regularity, whether regression is somehow part of the formula of the dialectic, I have to admit that I'm not sure. Mine is not a Pollyanna view of progress where it's just upward and onward at all times. Indeed, the life condition that we face here at the beginning of the 21st century, in which regression of our civilization is a real possibility—that's an important life condition that is calling for further development. So, whether these life conditions have to be just potential threats or whether they have to be actualized to motivate growth is something that is rather spontaneous and dynamic and not necessarily something that can be understood with a formula.

Let me add, regarding the dialectic, that it's more than just the shape of the process of evolutionary development. It's more than just the master system of evolution. Dialectical thinking is actually a mindset or critical part of the worldview of integral consciousness as I understand it. That is, in modernist consciousness—what Piaget calls "formal operational thinking"—there tends to be a lack of seeing problems through a developmental lens. For example, if you see a problem, it's typically conceived of as an either/or proposition. But from a dialectical perspective, when you begin to look at life's problems and conflicts and any kind of unsatisfactory situation, you begin to recognize that the conflicting elements are themselves being partially created by the relationship that they have with each other. You begin to see how the conflicting relationship is actually constitutive of the elements themselves. And this leads to the insight that conflicts are always moving in time, and that as conflicting systems move in time they demonstrate the process of a thesis calling forth its antithesis—they naturally reveal these polarities. And when we begin to recognize the dynamic of thesis and antithesis, this shows us how every problem, or every developmental situation, is really is a transcendent synthesis that's waiting to be achieved.

It takes practice, but this dialectical perspective actually provides a new epistemological capacity. And this new capacity can be compared to the emergence of the heightened sense of reason and logic that arose with the modernist stage of consciousness. Modernists are able to use reason and logic as a new epistemological capacity over and above that ability at the traditional stage. And it seems to me that when you begin to see things developmentally, see things dialectically and recognize problems as opportunities for growth, this provides a dramatic new way of seeing that can really make a big difference in improving the human condition.

Q: *As you very clearly point out, using at least the perspective of traditional, modernist, postmodern, and integral levels, all of these levels of consciousness exist at the same time in our societies currently; is that correct?*

A: Sure. That is, the elements of the dialectic are continuously co-creating each other to a degree, forming each other in their relationship. When we talk about these specific stages of history and culture, one of the insights of the integral worldview is that the history of consciousness continues to be spread out over the last 4,000 years of human development. That is, even though we're alive here in the year 2008, not all of us live in the same time in history. And according to Jean Gebser, it is the ability to recognize these historical structures of consciousness as they continue to exist in the present within the minds of individuals that actually gives rise to integral consciousness. These stages become transparent to your understanding when you begin to see them within people. For example, we can see how each one of these historical stages continue to include people who exemplify them in the present. And we can see how each stage has developed its own kind of orthodoxy—there are religious fundamentalists who are orthodox traditional, and there are atheists and scientific materialists who are rather orthodox modernist.

However, these structures of consciousness exist not only within the awareness of individuals, we can also see how these stages exist within a larger intersubjective system, which we might characterize as an "internal ecosystem of consciousness and culture." And when you gain an integral perspective, one of the things that happens is you feel a drive to awaken all of these forms of consciousness within yourself, so that you're able to make meaning with and share the values of the tribal, the warrior, the traditional, the modernist, the postmodern, and the integral—all these stages. From an integral perspective, you need to be in touch with all of these stages, you need to be able to metabolize their values in order to be authentically making meaning from the level of integral consciousness.

Q: *This sounds very much in keeping with what Don Beck talks about in terms of spiral dynamics—that the spiral lives within. Is this what you're getting at?*

A: Right. A good example would be business people. Maybe they have an MBA. They're highly educated and they find themselves in business. So we could perhaps recognize that they are operating from a modernist value system, or modernist stage of consciousness. But if they don't embody within them some of the more enduring and foundational values of traditional consciousness, there can be a tendency to collapse back into a kind of warrior consciousness, or what spiral dynamics calls the "red meme." For example, in the case of Enron, you see these sort of lawless corporate types basically engaging in criminal behavior. One of the things that caused them to regress into a criminal stage, even though they were highly educated and wealthy, was their lack of the values of traditional consciousness, which make people play fair, be honest and have honor in themselves. If you don't have those values within yourself, then the stage that you've achieved—say modernism or postmodernism—can be unstable. You can find yourself collapsing back and ruining your life like the executives at Enron did. If they just had a sense of fair play, then the company may not have crashed down like it did.

Q: *One of the aspects of the integral perspective that you are writing about has to do with the realm of spirituality. It's my sense that one of the challenges for an integral theory in gaining legitimacy—at least in the academic world, and possibly elsewhere—is the giving of equal value to that which can be measured and that which cannot be measured. The introduction of the idea of spirituality is a critical factor in that consciousness that you were just speaking about. Can you tell me a little about what you mean by spirituality?*

A: Sure. From my perspective, integral philosophy is founded on experience—that which is experiential, that which can be subjected to the tests of broad empiricism, if you will. This includes not only sensory experience of the material world, but also mental experience. For example, any experience with mathematics is a largely mental experience. It's not grounded in sensation; it's something that transcends the experience of our senses. Similarly, when we know another person in a relationship, this can be a very important form of experience that cannot be reduced to merely a sensory experience.

But in addition to sensory experiences and mental experiences, we can also have distinctly spiritual experiences that can be achieved in a variety of ways. For example, my deepest and most profound experiences of beauty, truth, and goodness are certainly spiritual experiences. And spiritual experiences can also be had through practices such as meditation and prayer. Indeed, it seems to me that spiritual experience is an important aspect of what it means to be human at every stage of development. Spirituality isn't something that can simply be reduced to the mythic stage of consciousness that only exists on a traditional level. Spirituality for me is a very important part of my life—it's what motivates me to get up in the morning, and it's what motivates me to write philosophy books. Spirituality is not a level of development to be transcended; it's a line of development that continues to find original expression in every stage, including the integral stage. And as human spirituality develops, ideally, it transcends and includes the best of the spirituality of the previous levels.

However, in my book, I do argue that science, philosophy, and religion need to be afforded a degree of separation. In other words, science deals with the physical facts of the external universe, and it has a level of proof that can be compelling; if you can prove something scientifically, it compels agreement. Spirituality, on the other hand, while it can be practiced and directly experienced, it deals with realities that exist in the realm of what we might call the "theosphere." That is, I'm arguing that the physiosphere and the biosphere are in the realm of science; the noosphere—the realm of consciousness and culture—belongs to the realm appropriate for philosophy, and then there's the spiritual world space, which can be identified as the theosphere—this is the realm of religion or spirituality. And spirituality has a very important role to play in making us feel at home in the universe by giving us explanations of the nature of the ultimate and teachings about life after death. These are teachings that can be used and practiced. For example, I definitely use the idea that I'm going to survive my body as an important orientation for my life on a daily basis.

Taking a million-year view of things really clarifies what's valuable. If I think about what will matter a million years from now, I think, well, my family and the people whom I love will matter, and the work that I did in the world to try and make it a better place while I was still here will matter. It's because of that million-year perspective that I'm fortified and motivated to do good works. I'm not doing good works in the hope that I'm going to survive my body; it's because I take for granted that I'm going to survive my body that I try to do good works. I'm not saying that you need to have a spiritual or million-year perspective or believe in life after death in order to be motivated to do good works in the world, but I've certainly found that it helps me. Religion makes you feel at home in the universe, and I think this is an important role for it to play. So I think we need to preserve the realm of spirituality and not try to reduce it to science or philosophy. I think we need to allow for the legitimacy of explanations that need to be taken on faith or explanations that have to be taken on the authority of a spiritual teacher or wise person? I don't think we can eliminate those just because they can't be proved scientifically.

Q: *It would seem to me that what you're suggesting is that, for some people, having the orientation that you've just described as one you have, where you have an element of faith and this million-year perspective that you've talked about, has a way of creating meaning for life and justifying it. It seems it is dependent on some esoteric notion of what the totality is all about as opposed to someone else who might look at the same situation and say that life in this lifetime is an experience I'm having. I might follow exactly the same patterns of behavior as you, because it means that my experience of this life in the now—in the present—is far more satisfying, for whatever reason, than requiring me to have that kind of million-year perspective and to act on faith rather than to act on a set of positive values related to my current experience.*

A: I think the integral worldview is roomy enough to include all kinds of spirituality—theistic spirituality that recognizes God as a being, non-theistic spirituality like Buddhism that recognizes Non-Dual emptiness as the ultimate, or philosophical spirituality which can be rather agnostic regarding these big, supernatural explanations, but can nevertheless recognize spirit in a very circumspect way. I think all these forms of spirituality can find a home within the emerging integral worldview.

On this note, I recently received an email from Connie Barlow, who is married to Michael Dowd. The two of them travel around the country giving talks on evolutionary spirituality. Michael just came out with the book *Thank God for Evolution.* They are a wonderful couple doing good work. After reading about them I sent them a copy of my book. Connie then sent me an email complimenting me on my book and she included a couple of critiques. One of them was she thought that I did a good job of separating Ken Wilber's metaphysics from integral philosophy, but that now I had to separate my own metaphysics from integral philosophy.

(Laughter)

I respected that; it was a thoughtful comment and it made me think. So next week I'm going to have a conference call with Michael and Connie and a few others to discuss this subject. My take on it is that we are in this universe at some existential level—we have to admit there is something rather than nothing. We're starting from there. And so once we come to grips with this, there's really no way to get away from metaphysics. Moreover, we can see that each stage has its own version of metaphysics. For example, if you're at the traditional level, your metaphysics is defined by the Bible, the Qur'an, or the mythic explanation that goes with your tradition. Then with modernism, there is a different ontological explanation of the way things are. It starts with Deism, but then the more extreme forms of modernism adopt a sort of atheistic perspective that the universe is a random accident, and there is no purpose to it; it has just emerged somehow.

Q: *Or at least agnostic in the sense of just not knowing; mystic, in a sense.*

A: Right, but to claim that we can somehow eliminate metaphysics, that we can have no questions or answers about the nature of reality, or no explanation of why there is something rather than nothing … this position is still thoroughly metaphysical. It's kind of a minimal, anti-metaphysical metaphysics, but it's still something that has to be taken on faith to a degree. Think about it. Human consciousness is so small and the universe is so vast, and the mystery of it is so great, that to claim that you know for sure that there is no God—now, that's a statement of faith.

Q: *That's the atheist view. I'm talking about an agnostic view of not knowing, of holding that there are questions of spirituality to be explored. There are questions we cannot know the answers to; hence, it relies on faith or a way of resolving those issues in our lives so that we can move forward.*

A: Yes. Because I'm doing this public work in the realm of philosophy, I certainly wouldn't say that the agnostic position is illegitimate; I think it's a reasonable kind of stance to take regarding the mystery of the universe. However, if the agnostic says, "There is no way anybody can know," I would say that…

Q: *No, that's not what they say. They say, "We don't know now."*

(Laughter)

A: Fair enough. But I can say that I do know, for me at least, I can testify that I've had a direct experience of the love of God. And this is, of course, a metaphysical, spiritual proposition—which I can't prove. But I want to add that my faith is not motivated by the need for security, I already feel secure so I don't need a mythic teaching to give me that security. For me, faith is more of an active adventure of using my consciousness to know or experience that which is beyond my everyday mental experience. For me, the spiritual practice of faith is kind of super-thinking. My experience of God's love for me as an individual—as part of my own spirituality—is something I know deep down at the cellular level, even though I know it by faith. It's kind of paradoxical to talk about, but faith is definitely a spiritual practice, and it's not just a belief in myths and miracles.

Q: *Interesting. You talk about a realm in which at least some of us have never had that experience, and wouldn't even begin to know how to reach it.*

A: Well, Blaise Pascal has a wonderful quote on the subject. He says, "Human things must be known in order to be loved; but divine things must be loved in order to be known." When you practice faith at the higher levels of consciousness, that faith gives you an experience which verifies that which you have faith in. But again, these things can become extremely paradoxical.

Various forms of spirituality do rely on the authority of the tradition or the teacher; and I think that can be appropriate in the realm of spirituality. But in the realm of philosophy, which I think in a sense should bridge and separate science and spirituality, philosophy can investigate and discover that which is beyond science. And it can do so in a way that doesn't rely on any particular belief system. Philosophy can unite people who may have differing views of what spirituality is, or an agnostic view. So even though you may not have a robust concept of the spiritual, you can nevertheless find answers and get a universe perspective on things like evolution and consciousness through integral philosophy.

Q: *You have several critiques of what you call the integral reality frame. Perhaps since I'm introducing the concept of the integral reality frame into this conversation for the first time, you can summarize what that phrase means.*

A: Each stage of consciousness, or epic of human history, has its own explanation of the universe, and those explanations don't necessarily remain static; they evolve. For example traditional consciousness in all its forms provides an explanation of the universe that frames that worldview. The reality frame of that worldview creates a kind of cell wall of the organism, the permeable boundary which makes the worldview a real evolutionary system. Indeed these worldviews are not simply phases of history; they cohere as evolutionary systems, which are somewhat similar to biological organisms.

One of the big insights of integral philosophy is the way that it recognizes real evolutionary systems within the internal universe of consciousness and culture. These internal systems share characteristics with the external systems of biology. So as we begin to recognize the internal systems of consciousness and culture, we see how these are composed of human agreements—value agreements that cohere into these historically significant worldviews which have systemic integrity. And so one of the things that gives each worldview its systemic integrity is its abiding reality frame. Each of these worldviews is a cultural agreement on the one hand, but each stage also exists within a larger dialectical evolutionary spiral—an internal cultural ecosystem. And the reality frames which help these stages cohere as systems are inevitably created through the use of some kind of metaphysics.

We can see this very clearly in the role that Rene Descartes' philosophy played in the Enlightenment. Descartes' framing of the subjective and the objective domains—his famous, "I think, therefore I am," has now become known as "the philosophy of the subject." This reframing of reality into subjective and objective realms—the objective being scientifically investigatable, and the subjective being supernatural, a realm of matter and mind—actually helped to forge the reality frame of modernism. Indeed, much of the postmodern reality frame has actually arisen through the various attempts to transcend the problems of this "philosophy of the subject." However, we're getting into some rather dense philosophy, which I try to unpack and explain carefully in Chapter 8 of my book. Nevertheless, the bottom line is that every worldview has some kind of reality frame, some kind of metaphysics that it uses to create the agreement structures which make it cohere as a worldview and allow it to do the important work that these worldviews do to produce cultural evolution.

Moreover, we can see how these reality frames are subject to the dialectic, such that the problems or shortcomings of each specific reality frame require that the next reality frame to emerge in the sequence of evolution be in sort of an antithesis to that. We see this dialectic progression in action in the way that the reality frame of traditional consciousness is defined by the mythic order of religion. Then the reality frame of modernist consciousness swings the other way and is defined as whatever can be proved by science. Then the reality frame of postmodern consciousness swings back to a kind of unconstrained subjectivism. Thus, the integral worldview—in order to be a worldview, in order to take form and do the work it needs to do within the timeline of human history—needs to have its own distinct reality frame. Ken Wilber has tried to offer such a reality frame through his four-quadrant model, and I take issue with it to a degree, but I also applaud it.

I think that Wilber has done for the integral worldview something very similar to what Descartes did for the modernist worldview. He reframed reality. That’s what the quadrant model does. It shows the internal universe in new and important ways. Wilber recognized that this domain of intersubjectivity—the lower-left quadrant as it’s called—is not just a metaphor. It’s not just a structure of language, but it’s actually a real domain of evolution where real systems—these systems of culture, these human worldviews—have an ontological existence. These structures are not just in my head. They’re not merely subjective, even though they’re not completely observable scientifically. So they’re not merely subjective, but they’re not objective either. These cultural structures exist in this newly framed domain called intersubjectivity. And this is what gives integral philosophy a lot of life. It gives it the ability to make contact with these cultural systems in ways that are revolutionary, and in ways that give us new powers to improve the human condition. The main reason I love integral philosophy, the main reason I’m attracted to it, is because it’s pragmatic. It can do work. And so this new reality frame is one of its important features that gives it its ability to do this work.

Q: *Let’s talk about integral mapping for a moment. You’ve referred to the holon and the quadrants and by implication with developmental levels, the holarchies. I noticed that in your treatment of the history, which was very well done, summarizing the original contributions of Arthur Koestler and how Wilber has built on those, that you at one point made reference to the distinction between individual and social holons. In the work that I’ve been doing with Mark Edwards and Integral Leadership Review, we’ve been separating those two, so that when we’re talking about the four quadrants, at least in my mind—I’m not going to speak for Mark—I think of upper-left as intentionality and as the worldview and the beliefs of the individual. Upper-right is the biology and behaviors. What I’ve done in thinking about the individual is then to treat the upper-left as intentionality about self; in other words, the agentic intentionality, and the upper-right as the agentic behaviors. The lower-left and lower-right are the communal aspects of culture and systems if you will, but not so much the literal culture and the systems as* *much as how the individual comprehends those. Do you make any distinctions between individual and collective holons?*

A: Sure. I think Ken Wilber has done very important work in correcting the confusion in this area. For example, Wilber talks about deep ecology, environmental spirituality, at great length, where there is often this misunderstanding between the nature of an individual holon and a social holon. Readers of Wilber will know that you can't just stack a social holon on top of an individual holon and call it a holarchy. So I think that distinguishing social holons from individual holons is an important element of integral philosophy.

Q: *You write about the notion of artifacts that Wilber and Fred Kofman have talked about. It would seem to me that in talking about an individual holon, there is no artifact.*

A: The quadrant model has been very useful in taking holons and showing how they emerge simultaneously in these different domains, but I also have some critiques of the quadrants, which I offer in Appendix B of my book. I'm not saying that the quadrants are invalid, I'm just saying that they are one slice of a picture that we are trying to discern, and we can't use them as the end-all and be-all of integral theory.

Q: *It's just affirming what Wilber talks about in terms of them being the map and not the territory.*

A: Also, all aspects of integral philosophy are true, but partial; they're adapted to our time in history. Indeed, the whole point of the worldview is that it can help us make progress relative to the specific problematic life conditions we face today. But as those life conditions eventually become ameliorated to a degree, then progress will come in the form of a newer worldview that's partially antithetical to the worldview of the integral. In other words, by using the spiral of development we can see how these worldviews emerge in this dialectical sequence, and this has predictive value. It not only shows us how we can create the integral worldview in our time, it also shows us that the integral worldview is not the end of history. It, too, will one day be transcended as it develops the successes, and the problems that are associated with those successes, that will call forth the next stage.

Q: *There you are really pinpointing what I think is probably the greatest strength of the work that's being done around all of this—the recognition of the relationships among the different worldviews, frameworks and stages of development and how they are necessary to each other in the evolutionary process.*

One of the critiques of the integral reality frame that you offer is that as a philosophy, or as a metaphysics, it lacks a robust theology. Could you say a little more about what you mean by that?

A: Sure. At the end of Chapter 8 entitled, "The Integral Reality Frame," I offer some critiques along the lines of what I've just described, I explore how we can poke holes in this integral reality frame. So I offer four distinct critiques that are basically grounded in each one of the levels, beginning with traditional consciousness. However, in this critique of the integral reality frame made from the traditional level, I'm not trying to create a cartoon caricature of traditional consciousness, rather, I take it seriously and recognize that there are people with good sense and good faith who have a center of gravity of traditional consciousness. For them, creating higher levels of civilization is grounded in a religion. It's grounded in faith, and grounded in a robust theology that explains where we came from, where we're going…the big questions. So the traditional critique is that the integral reality frame allows for spiritual pluralism, and so it cannot provide an authoritative theology that all integralists agree with.

Again, in my book I argue that philosophy and religion ought to be afforded a degree of separation so that we can carry forward the values of spiritual pluralism that emerged at the postmodern stage. However, as we now attempt to transcend postmodernism we can also begin the work of discerning and determining which forms of spirituality are most effective at raising consciousness, improving the human condition, and revealing spiritual truth. But we're just beginning, I think, to go beyond polite spiritual pluralism and it's a little too soon for us to declare any one form of religion as essentially "right" to the relative exclusion of the others.

Going back to your question about this critique that I offered from the traditional stage, they're saying that by separating science, philosophy, and religion, you're losing a lot of the benefits of religion that can be used to form an organizing principle for a society, which it does, at the traditional stage. So as in medieval Christianity or in any of the pre-modern societies, the reality frame is exactly the same as the religion's teaching about reality. Traditionalists would criticize forms of spirituality that allow for pluralism, that separate the philosophy from religion and disempower religion from a traditional perspective as the dominant truth in the society. Now, of course, my response to that critique is that in order for us to move beyond the traditional stage—in order to go beyond the mythic where there is no separation of, for example, church and state—then a degree of disempowering of religion, a differentiation of the value spheres as Max Weber was kind to point out to us, is a necessary step for the development of civilization. Perhaps some time in the future, when humanity has evolved to the point where we can have a world theology or an agreement about spiritual truth that is fully transcendent and can be universally agreed upon, that would be tremendous. But I don't think we're at a point in history where there is one particular theology that is strong enough to unify us. Any theology that had to be coercive in unifying people wouldn't be unifying in the first place. That's just a particular aspect of what I might imagine as a traditional critique of the integral work.

Q: *Correspondingly, there is a modernist critique related to the metaphysics of the integral reality frame not being subject to falsifiability. How does that challenge get addressed?*

A: Karl Popper, prominent 20th century philosopher of science, came up with a criterion for valid knowledge which he calls "falsifiability." That is, if you can imagine a scenario under which a proposition could be proved false, then it's valid knowledge. If you can't imagine a scenario in which it could be proved as false, then it doesn't count as valid knowledge. The trouble is that while this defines what is and isn't science, it's highly reductionist in the sense that there is an implication that only science can deliver valid knowledge. My response to that is to evoke the idea of broad empiricism, which was first advanced by William James the pragmatist philosopher—he called it radical empiricism. And Wilber has modified and refined it into what he calls "broad empiricism." It shows that some of the same methods for creating an empirical agreement in science can be extended to include things that are not necessarily accessible to scientific investigation, but are nevertheless "falsifiable" in a broadly empirical sense, because, although philosophical or spiritual propositions may not be materially falsifiable, others who are at a similar level of development can actually have a similar experience, which makes these kind of propositions broadly empirical. Wilber has done a good job of showing how broad empiricism can be a way of answering the critiques of falsifiability.

Q: *These would be the integral multiple methodologies.*

A: Integral methodological pluralism is what Wilber calls it. I think these ideas are generally valid, but regarding some of Wilber's latest writing found in *Integral Spirituality*, as well as some of the latest turns that his theory has taken, I don't find all of those details as useful as some of the other more sturdy and basic aspects of integral philosophy. I can see that integral methodological pluralism may have its uses, and might be valid in certain academic contexts, but I don't find these ideas to be a particularly exciting development from my perspective. I'm not harshly critiquing these ideas; I'm just not seeing them as all that useful.

Q: *It comes up for me in thinking about how to work with PhD. students on doctoral dissertations related to using integral theory and perspective in doing research.*

A: What I like most about Wilber's methodological pluralism is the unification of the structural and the phenomenological approaches to consciousness. That's the part that I think is a worthy addition to integral theory in a sense that structuralists can see things that can't be seen from a phenomenological perspective. In other words, you can meditate and you're never going to discover the spiral through meditating. However, with structuralism by itself, unless you're acquainted with the insides of these structures that you're studying, you're never going to get a true sense of what they are. Understanding that we need a phenomenological approach from the inside and a structural approach on the outside to adequately map and understand these stages of consciousness I think is a valid point and one I would agree with.

Q: *What about the critique of the integral reality frame from the postmodern perspective—the argument that it's all Eurocentric dominant male thinking—that it's too cerebral and too concerned with "the truth" instead of many truths.*

A: We're going through each of these critiques which I offer of the integral reality frame, the first being traditional, which I mentioned; the second being the modernist critique, which is the reductionistic approach; then there’s the postmodern critique; and finally I offer a “postintegral” critique of the integral reality frame. So with respect to the postmodern critique, I think there are basically two kinds: one is the critique of the integral reality frame from the perspective of postmodern philosophy—deconstructionist critical theory; and then there’s another critique from postmodern culture in general, which is the one you were mentioning regarding the complaint that “it’s too masculine” or “it’s too Eurocentric” or whatever.

From an integral perspective, we can see how the postmodern worldview—and I’m using “postmodern” as a defined term—isn’t just deconstructionist academic critical theory. We’re talking about the overall worldview that comes after modernism, the one that has emerged in the developed world as a sort of antithesis to modernism. This worldview is known by many terms, including the “cultural creatives” and the “post-materialists.”

In integral parlance there is a growing agreement that the word “postmodern” is the word we want to adopt as the defining term for this stage. That is, from an integral perspective, we can see that there is an evolutionarily appropriate move that goes beyond modernism and traditionalism and which takes the form of an antithesis. In other words, postmodernism is anti-modern and anti-Western to a degree. And there is an imprint of that antithesis that is seen in many aspects of postmodern thinking. Again, this is evolutionarily appropriate; the move away from the pathologies of modernism was achieved by pushing off against those problems, by moving to an antithesis. For example, the move that took human civilization from traditional consciousness to modernist consciousness was embodied in the slogan, “Liberty, equality, fraternity.” It was sort of a political rallying cry for democracy. Then in turn, the move away from the established structures of modernism was achieved or symbolized by the slogan, “Turn on, tune in, drop out.” Despite its semi-humorous quality, this rallying cry did serve as a potent invitation to reject the pathologies of modernism. So if you look at postmodern politics, it’s kind of a politics of protest. It’s a politics that defines itself in relation to the shortcomings, the pathologies, and the crimes of modernism- including colonialism, oppression and exploitation, we could go on listing the problems of modernism—but overall we can see how postmodernism made the important move of breaking away from those problems.

However, this postmodern worldview is now in a place where it’s gone as far as it can go, even though there will be people entering into the postmodern worldview for the rest of our lives. It’s a structure of history that people will pass through as they develop culturally. But what we’re interested in now is taking an evolution a step further beyond postmodernism and going to the stage of synthesis where we’re no longer defined merely in terms of an antithesis to what’s wrong with modernism.

As we try to create a synthesis that carries forward the best of all these previous worldviews, while also pruning away the worst, we can see that from a postmodern perspective, integralism looks very much like modernism. And when modernists see integral, to them it appears postmodern. These stages have a tendency to see everyone who is outside of their worldviews as being suspect. So the postmodern critique of the integral worldview is that it's basically just rehashed modernism. Therefore, it's still complicit in the crimes of modernism. But from an integral perspective, we can recognize those attacks, those critiques from a postmodern perspective. We can also overcome them by recognizing that postmodernism is not the end of history and that there are certainly many positive developments of the modernist and traditional stages. At this point in history, in order to move forward, we need to recognize and acknowledge those positive aspects and integrate them into a transcendent whole that can use all the important truths that have come from the rise of the postmodern worldview. So we include those truths but also simultaneously transcend them through this new worldview that we're creating.

Q: *That opens directly on the door of integral politics, but I want to go somewhere else first. That has to do with what I think is a very creative way of reframing the notion of lines of development. You have argued that there are three organizing principles of the various aspects of being in the world. That has to do with will, cognition and emotion. These are really overlapping concepts that have things in common with each other, with the interpersonal and the idea of self being somehow the linchpin of these three modes of consciousness.*

A: In my analysis of the lines of development within consciousness I start with Howard Gardner's work on multiple intelligences. Then I bring in Daniel Goleman's work on emotional intelligence. Then I try to show how we not only have emotion and cognition, but that there is another sphere of knowing which I identify as volition, or free will. So each one of these spheres—feeling, thought and will—are important metastructures that organize our consciousness.

Within each one of these domains there are a variety of lines of development, which overlap and comprise the various ways that humans can be smart or emotionally intelligent. The old idea of "IQ" can be taken as a measure of overall cognitive intelligence. And now we have the idea of "EQ," which has become popular since Goleman's book *Emotional Intelligence* came out in the 90's. EQ thus refers to emotional intelligence and one's general emotional ability. Then I add to that the idea of "VQ," or values intelligence. This fills out all the potential lines and organizes them into a holarchy.

Part of the way I came up with this understanding was following my philosophical intuition. Again, I have always identified myself as an ally and supporter of Ken Wilber. I'm definitely standing on his shoulders and can't say how grateful and indebted I am to his work. At the same time, one of the things that has motivated me to try to make my own contribution to integral philosophy has been my differences with Wilber. That is, although we agree on most aspects of integral philosophy, our disagreements are the most interesting. This is how philosophy has always evolved—a great philosopher makes some major progress and then other philosophers try to show how that's not necessarily wrong but how it can be improved.

So regarding the lines of development, Wilber began teaching this subject through his psychograph model, which first appears in his 1999 book, *Integral Psychology*. Then in the past few years he has elaborated on it and explained how there are all these multiple lines of development, which actually develop independently. Wilber cites the case of the "Nazi doctor" who is highly developed in the cognitive line, a highly educated scientist, but who is also very stunted in the moral line, because he's a Nazi. So I agreed with that—I think there are different lines of development and different types of intelligence, so that all made sense to me.

But my philosophical intuition was piqued when Wilber wrote that the "values line", or the "worldview line" that is really the line of the spiral of development, is just one among several dozen lines, and that these lines are "apples and oranges." That struck me as being not entirely true. That is, I agree with Wilber that there isn't a single line—as was maintained by Piaget, who just thought he was getting at development overall—and I think that's a valid critique of many aspects of developmental psychology, that there is no singular line of development within consciousness. There are actually multiple lines, and developmentalists haven't done a very good job of identifying and coming to grips with that.

However, my humble critique of Wilber is that he goes from a critique of this "line absolutism" to the other extreme, which I would characterize as a kind of "line relativism" where we just have all these unrelated lines. Even though each of these lines develops in its own kind of holarchical stage-like system, Wilber hasn't recognized—or at least hasn't described in his work thus far—how these independent lines are organized by a larger overarching system.

If the lines are indeed holarchical structures, then the overall structure of the holarchy that we see throughout evolution would suggest that there are some higher level holons that transcend and include these various different lines. So in Chapter 9 of my book I first explain why I think the values line is somehow more important than other lines, and how the values line isn't just "one among several dozen." I explain why the values line has a more important role in determining our psychic or culture center of gravity.

Chapter 9 begins by examining what developmental psychologists have said and then what Wilber has said about the subject. Then I offer some critiques that show problems with Wilber's psychograph model. I then advance my own theory, which involves the recognition that these lines of development are organized within a larger enveloping system of feeling, thought, and will as a sort of master systemic pattern of consciousness. That is, when we see how the spiral influences many different aspects of our will, the sphere of volition within our consciousness, then we can begin to see how it is generally more significant than, say, bodily kinesthetic intelligence or the emotional ability to be empathetic. Those are lines that can develop independently, but I would say for most people these kinds of intelligence are less significant than their core values. So when we recognize the very important role that values play in orienting our attention and determining our intention, and when we see that our values come largely from our worldview, our position on the spiral of development, we begin to see why "the values or worldviews line" is so important in determining the internal location of our consciousness overall.

However, this is obviously a complicated subject, and it's best described in a written argument. It's difficult to reproduce it completely here in an interview.

Q: *I have a couple of questions in relation to that. I'm wondering about the location or choice of subcategories. For example, you just mentioned "empathy," and it doesn't show up on the diagram. Another one might be "resilience" that didn't show up. I'm wondering if there was a guiding set of principles other than sorting things into cognitive-emotional-volition values variables that caused you to place things in one circle versus another?*

A: That's a great question. The diagram in my book that shows the sub-lines within the overall categories of feeling, thought, and will is drawn partially from Howard Gardner, partially from Daniel Goleman, and partially from Clare Graves, Robert Kegan, and James Mark Baldwin. However, as I explain in the book, if you'll allow me to quote: "Figure 9-4 is presented for the limited purposes of suggesting how the intersubjective structure of the spiral of development influences a variety of lines of development within the overall sphere of human volition. This simplified diagram is not intended as an exhaustive chart of all possible sub-spheres or lines of development within human consciousness." So the diagram in my book is just a snapshot showing some of the sub-lines. The number and size of the categories could be different with every person.

Now, regarding the sub-lines found within the overall *Sphere of Cognition*, as I said, I'm building on the work of Howard Gardner, who is a very prominent developmentalist. He teaches at Harvard and he has done quite a lot of empirical work to discover what he calls "the eight intelligences" within "cognition as a whole." His criteria is: "What does society value and what is the culture willing to reward?"

This research was advanced in Gardner's book that came out in 1999 called *Intelligence Reframed*. Gardner is arguing against IQ as a sort of a monolithic line. Throughout the 20th century, educators used a test to determine the "quotient" of a person's intelligence, and IQ was seen as a measure of being smart or dumb across the board. So Gardner has devoted a large part of his academic career to dispelling that myth and showing that there are different kinds of intelligences. It makes perfect sense. You can see that a gymnast has one type of intelligence and a great mathematician has another kind, so we can't judge "smart" or "dumb" across the board. By using Gardner's eight intelligences in my sphere of cognitive development, I'm being true to his work and using him as a foundation of that aspect of the model.

Within the overall *Sphere of Emotion*, again I use the work of Goleman in the identification of the sub-lines, who has become well respected in society and whom Gardner talks about approvingly. Indeed, Gardner recognizes emotional intelligence, but says that he wants to be formal in his definition of these eight intelligences, so he doesn't want to define emotional intelligence as a formal intelligence; he wants to call it "emotional sensitivity". Nevertheless, in the book, *Emotional Intelligence,* Goleman does describe different types of emotion—sadness, anger, joy, etc.—and I list those in Figure 9.4. However, there's nothing exclusive about the list that's in that circle in Figure 9.4. It's just some types of emotion that have been recognized by the social sciences, but they are not suggested to be exhaustive. You would want to do more empirical research if you were going to try to definitively identify the specific lines of development that are within the affective or emotional sphere as a whole.

All I'm doing is recognizing that there are different types of emotion—the experts agree. And there are different kinds of cognition—again, the experts agree. And in addition to the modes of emotion and cognition, both Goleman and Gardner (as well as other developmentalists) agree that the *Sphere of Volition* or free will is also a mode of consciousness that is distinct from both feeling and thinking. However, Goleman, Gardner and other authors in this field tend to shy away from the sphere of volition, because it's not really accessible to science. Just like biologists shy away from consciousness because it's *in* the body but not really *of* the body, these developmental psychologists tend to shy away from volition because is not really accessible to scientific investigation the way the physical parts of the body are. Human free will is a kind of transcendent form of consciousness that can't really be contacted or explained by science. Social scientists are thus somewhat embarrassed by it, because it's inherently metaphysical.

Free will—the idea that human beings are responsible for their actions, and that their will represents an "uncaused cause," that our will can somehow move around the particles in our brain and cause our bodies to move without being predetermined—this can't be explained from the mechanistic materialistic worldview. The human will is thus supernatural in that sense. So there has naturally been quite a bit of effort by materialist philosophers and scientists to try and explain that free will is an illusion, and that ultimately, all human choices are predetermined.

Of course, I reject that and I see free will as central to a spiritual understanding of the universe. Our role in the cosmic economy is really made effective by the fact that we do have freedom of choice, that we do have real free will. Indeed, this is how we participate directly and creatively in the evolutionary process—our free will allows us to act as agents of evolution. Yet, this is an inherently spiritual concept. But even though science can't deal with spiritual issues, philosophy can. That's why I make free will and values really the cornerstone of my understanding of integral philosophy.

Q: *All of this comes to play in the context of your treatment of integral politics, which ultimately leads you to a model of integral world federation. Would you care to say anything about what it is that is integral from your point of view in terms of politics. How do you approach that?*

A: We can see that every one of these worldviews—these historically significant worldviews that are identified by the integral perspective—emerges as a new octave of values. That is, each one has new truth, new beauty, and new ideals of morality. And the values of every one of these worldviews have been forged in the crucible of politics. So, for example, when we move from warrior consciousness to traditional consciousness, one of the ways that traditional consciousness is able to make progress and improve the human condition is the way that it replaces the chaotic and warlike world of warrior consciousness—warring tribes, etc.—with a political system that brings some level of peace.

With every form of traditional consciousness, East or West, the political system that goes with it is feudalism. Now feudalism is something we'd like to transcend—it's something to be looked down upon now as a primitive political structure—but it was a definite improvement over what came before it. It brought some form of law and order, even though it was oppressive and classist.

Then when modernism emerges, it likewise has new truth, new beauty, and new ideals of morality that are embodied in the transcendent political form of organization called democracy.

Thomas Jefferson really understood democracy at the beginning; it was clear to him that without a degree of modernist consciousness within the population, democracy would be dysfunctional. He could see that not everyone in the democracy needed to have a modernist center of gravity, but a certain proportion did, so that they weren't in a conformist, traditional worldview where they were willing to be obedient sheep. They had to take responsibility for their own government, not tolerate corruption and be willing to put in the effort to try to create a government by the people. So democracy showcased the values of modernism and showed its moral superiority. The evident moral superiority of democracy over feudalism really served as a beacon of goodness that helped recruit people into the modernist worldview and make it successful.

Then, with the rise of postmodernism, we can also see the crucible of politics being very important. In the sixties, people were recruited and attracted into the postmodern way of seeing things by its higher ideals of morality. They could see that its political agenda of peace in Vietnam and civil rights was an exemplification of a worldcentric morality that transcended the more ethnocentric views of these earlier worldviews.

So now with the rise of the integral worldview, it is going to take its place in the timeline of human history as a historically significant stage. And it will have its own transcendent form of human politics. If we just look at the evolution of human politics, we can see that in 1,000 B.C., it's estimated that there were 600,000 countries or sovereign political entities. And over time, these 600,000 political entities have been consolidated into larger and larger groupings. So although there have been periods of regression or stagnation, there are now about 193 countries. And now we see with the European Union (EU), and other types of federations of countries, that the direction of evolution in human politics is toward larger and larger conglomerations. And this is made particularly possible with the advent of democracy.

I certainly see the EU as a positive political development. We can see how it has done a lot of good in terms of uniting Europe, making it one political entity, making things more economically prosperous through the advent of a single currency and the reduction of trade barriers. We can see that by pushing power up and having an overarching federation that reduces competition amongst European countries, that has allowed power to be pushed down. For example, Scotland has now been given a degree of autonomy that it didn't have before the EU. It's because of the EU that England was able to divest a certain degree of power over Scotland. The same thing happened in Spain. Since Spain has become part of the EU, Catalonia as a province of Spain has been given far greater autonomy than it enjoyed during the 20th century.

So it is clear to me that as the integral stage takes its place along the timeline of human history, it too will bring its own transcendent form of political organization that will showcase its higher morality. Just as modernism and democracy co-created each other, so too will the rise of integralism eventually bring forth a system of democratic global law, although I doubt I'll live to see it.

But I want to quickly add that as we see this process developing, we can also see that these stages of political organization are dependent upon the corresponding internal development of consciousness. So for example, when you try to bring democracy to Iraq, because you have a population centered in pre-modern consciousness, democracy becomes highly dysfunctional. Until Iraqi's can develop a larger degree of modernist consciousness within their population, then democracy will continue to be problematic. Because of their traditional, ethnocentric level of internal development, it's difficult for them to participate in a multi-ethnic nation state, which is the democratic form.

So before there can be a functional form of world federation, we will need to have a greater degree of integral consciousness in the world. This is why the main focus of integral politics right now is on building the integral worldview here at the beginning.

Q: *Using the lens that you're describing now—I'll let people go to the book to find your model for world governance—could you talk about what is happening in the American political system today in terms of the presidential race?*

A: Overall, integral politics is the political agenda that goes with the integral worldview. And this agenda is now being worked out, agreed upon and negotiated among people who have an integral perspective. I'm arguing that as the integral worldview matures it will produce a transcendent form of human political organization that will come in the form of a limited democratic world federation.

Again, I think that the ultimate goal of world federation is inseparable from integral politics, in the same way that the politics of modernist consciousness is inseparable from democracy. However, I can say that integral politics can do a lot of work prior to the long-term goal of some kind of global democracy by making immediate progress on the domestic front—politically here in the U.S., in the years ahead. And there are both short-term things that integral politics can do and long-term things. The long view helps inform the short-term view. They work together. However, integral politics is something that's just emerging now. I'm not claiming to have the final and authoritative view of what it is. I'm interested in entering into dialog with other integralists like yourself about what integral politics can become.

And I should say that there are some people who have a general center of gravity in the integral worldview who are more oriented toward Republican candidates than to the Democratic ones. Just because you're an integralist doesn't mean that you're necessarily going to be a leftist. However, I do think that because you can't really get to the integral stage without transcending and including the values of postmodernism, then this is going to have an effect on your political views. That is, if you aspire to be integral, but you don't have empathy for postmodern values, then you're not going to be authentically integral. You're going to be a sophisticated modernist. But if you do hold the requisite degree of postmodern values, then this makes it difficult to be too conservative politically, even though you may see certain issues where the conservatives have a better argument.

However, regardless of who is elected president in 2008, because of the current profile of the American body politic, that person will be a tool of the system to a large degree. Because of the state of evolution of consciousness in America, and because it is a democracy, the next president won't be able to just lead us all into the integral age, because to govern effectively, the next president has to remain identified with the modernist values system. Modernism represents over 50% of the American population and I think all the presidential candidates have a modernist center of gravity. Some are more influenced by traditional values; some by postmodern values, but overall, they're all modernists.

The only political candidate who could be recognized as having a center of gravity in postmodernism would be Dennis Kucinich. Barack Obama or Hillary Clinton or even John McCain can certainly make meaning from an integral perspective. They can see that there is traditional and modernist consciousness, but again I think their center of gravity, at least from my perspective, is still in the modernist stage.

So at this point in history the real opportunity to make political progress from an integral perspective won't be found in the realm of presidential politics. Our opportunity to make the most political progress will be more in the realm of raising consciousness and helping make progress culturally by helping move America's cultural center of gravity forward in history in a way that then allows the federal government to follow suit. If we can get people to evolve their consciousness, then we can help break the logjam of the culture war. And this will help America to become less politically stagnant, and it will thus help the federal government to move forward as consciousness moves forward. As we raise consciousness in the American culture, we'll begin to see elected leaders who embody integral values more.

Q: *There are so many different levels and dimensions of society in which that can be happening. Whether you're talking about the worlds of entertainment, sports, politics or educational systems, it's truly a society-wide effort. Is that what you're suggesting?*

A: Definitely. When I give my presentation on integral politics, one of the things I emphasize is that the postmodern worldview, because it arose in this stance of antithesis, as I described earlier, is presently acting as a kind of cork in the bottle. In other words, because postmodernism is so anti-modern and anti-traditional, this tend to make these other earlier worldviews rather defensive. And this defensiveness kind of pins people in place culturally. For example, many people who are centered in the traditional or modernist stages perceive the environmental movement as a strictly postmodern issue. And so because postmodernists have contempt for many of the important values for traditionalism and modernism, some modernists and traditionalists repay the favor and exhibit contempt for important postmodern values. And this tends to make postmodernism's ardent support for the environmental issues—issues that everyone should ultimately care about—somewhat of a liability within American politics overall.

So now, the best way that the integral worldview can help make political progress in the short-term is by helping a portion of those with a postmodern center of gravity move up to an integral center of gravity and help un-stop the cork. If more and more postmodernists come to better appreciate the enduring and foundational values of modernism and traditionalism, this will help make postmodern concerns seem less anti-American or anti-modern. As we carry forward some of the values of traditionalism and modernism into the integral worldview, we'll find that we can carry forward many of the traditionalists and modernists themselves into a new era of progressive agreement.

Q: *For example, we're seeing religious leaders increasingly expressing concern about the environment and our care of the world.*

A: Thomas Friedman argues that "green should be the new red, white and blue." He argues that to be concerned about the environment is to be patriotic. Even though this concern for the environment originated with postmodernism, Friedman is now trying to show that environmentalism is a value that can be appreciated by every stage, he wants all Americans to agree that saving the environment from the destruction of global warming is something we can all get behind. And building the political will for that is something that the integral worldview can make great progress in, because it can help heal some of the wounds of the culture war by providing a progressive synthesis that isn't as anti-modern as postmodernism. It can demonstrate what is actually a "more progressive" form of politics than what passes for progressive politics today. That is, integral politics is more progressive than postmodern politics because it carries forward all the worldcentric and environmental concerns and values of postmodernism, but does so in a way that better integrates and builds political will with these other earlier stages of modernism and traditionalism.

Put differently, postmodernism's basic solution is to get everyone to become postmodern. And if everyone woke up tomorrow and realize that "we are all one people," and that this postmodern perspective is the most advanced, then that would indeed create the kind of political will we need to solve many of our problems. But because we can see in history and in the evolution of consciousness that it's unlikely that the majority of America is going to wake up tomorrow and become postmodern, we can see that we have to find a way to make political progress that addresses people in the stage they are at and works with the values that they have.

The integral political perspective really brings a lot of new insights and abilities to help move America's cultural center of gravity forward in history. And this can go a long way toward building the political will that it's going to take to solve the crises of global warming and other problems.

On the subject of integral politics I should add that many people see Barack Obama as the savior—he's kind of the projection screen for everybody's hopes—and while I'd love to see more hope and unification in politics, I also see people holding onto this Kennedyesque fantasy of a leader of our culture. But that time in history has passed. Kennedy was president before the emergence of the cultural structures of postmodernism, before the radical partition that occurred in the sixties. So now that we've seen the differentiation of these stages more distinctly in our culture, now that consciousness is more spread out between traditional, modernist, and postmodern, I don't think we want to regress to the point where one person can provide the kind of cultural leadership for America as a whole, in the way that Kennedy did. Consciousness has evolved since then, the horse is out of the barn. We need to find agreement in a way that doesn't require that we regress to a unified modernism or somehow find a mushy middle where we can all agree. We can take an integral and developmental perspective which brings in this vertical dimension that can see these stages emerging through time and can find a way to integrate the stages that doesn't just involve a kind of centrist position that just compromises on every issue.

To conclude integral politics, let me say that although the next president will be limited in what he can do, I'd like to see the next president bring in integral advisors—maybe not at the cabinet level, but at least some folks on their staff who can give them an integral analysis of the issues, especially foreign policy issues. Once you can see this inner perspective of consciousness, there are really a lot of insights and solutions that appear. My next book is going to be focused on that; the working title is *Global Politics and the Physics of the Internal Universe.* My plan is to take this integral perspective and apply it to various issues around the world, as I did in the interview in the last issue of *What Is Enlightenment?*, called "Integral Politics Comes of Age," which I highly recommend to your readers, and which is available to read on-line at wie.org.

Q: *Have you sent a copy of your book to any political candidates for the presidency?*

A: I actually made inquiries with the Clinton foundation. Because Bill Clinton has read Wilber, has endorsed him and said good things about his work, I wanted to send my book to Bill Clinton. So I made my inquiry through channels and I got the response just a few days ago from his organization. They provided his personal address and invited me to send my book directly to him, but they added that he is very busy and may not be able to respond.

(laughter)

So in addition to Bill Clinton, whoever emerges as the democratic candidate will also receive a copy of my book. But there are obviously hundreds of authors that are doing the same thing, and so I don't expect that it will necessarily have much of an impact. Ultimately, the way we'll get the attention of political leaders is to get the attention of the greater culture. And so as we emerge as a force in the media and in the culture at large, we'll get their attention in that way, rather than just by sending them a book. I'll do it nonetheless, though, since it's a good gesture.

Q: *I wish you all the luck in the world with that effort.*

(laughter)

A: Thank you Russ. I appreciate this interview.

Central Fire

Andrew Campbell

Central Fire was inspired by the then *one third* complete essay an author is developing for publication in *Integral Review*, on mystical numbers, geometry and quantum qualia - some of the passages in the imagery here are delicious, slippery sliding to my mind. Anyway, use it as you wish. If you have glossy photo paper ever, print one out and put it in a little frame by your desk...

Take a look at 200% and more and track over the colours and undulations, enter into the spaces…

If you print it out and hold it upside down you may see in the red passage - near the centre, you may be able to make out an unhappy face - ;-) sometimes imagery like this can go either way up...Mmmmm. Also the blue passages seem to want to be in pairs...

Editors' note: Although the author's craft-work may come along later, *Central Fire* is for sharing now.

A Lesson to be Writ Large?

Sara Nora Ross

With
Held Lightly
by **Andrew Campbell**

This is a true short story. Elements of it are more earthy than I might like to write about, but they cannot be disguised and still have a story. I happen to think it's a story worth sharing. Despite its earthy origins—if not because of them—it seems worth sharing because of its lesson. In sharing my story, lesson, and reflections on it, I hope this leads others to imagine what sorts of personal and social significance might be gleaned from such a lesson. I wonder if it might be a lesson we wish would be writ large.

On many nights, I keep my bedroom windows open. One morning last autumn, I awoke well before dawn, unusual for me. An odd smell in the room was the culprit that woke me. Once I was awake enough to do so, I realized the smell was in the outside air breezing through the window nearest my bed. It was an alien odor I had never smelled before. Noting that, I closed the windows and fell back asleep. When the alarm clock woke me later, I was surprised that the odor was still in the room. As I moved through the house doing my usual morning things, I was more surprised to find that it permeated the house. I closed every window to shut it out, thus simultaneously trapping it in the house. There was no escaping the awful thing!

When it was time to walk up to the barn to feed the animals, I noticed the smell was stronger in certain areas than others, and fainter near the barn. When I walked down the long driveway hill to get the morning newspaper, across the bridge that spans the creek down there, the odor was much fainter than up the hill where the house sits. So, I toured around the house, determining that the odor was strongest on the south side where there are several hilly acres of woods. It was so strong there that I became nauseous and wanted only to escape the inescapable!

I began to form a hypothesis about the odor's origin. My memory traveled back a handful of years, to a time when a decomposed human body was discovered in the creek, downstream from my place. It was found near a public bridge that spanned the creek not too far from here. I remembered a neighbor telling me at the time that for several weeks, when he drove over that bridge, he knew the odor he smelled "just wasn't right." At least in the 20/20 hindsight he had when telling me about it, he said he was sure it must have been a human body decomposing. He had smelled plenty of dead animals, and this was not that. Perhaps he had military service in earlier decades that taught him such smells. He wished he had called the police to tell them about it, long before someone else eventually did.

Coming back to the autumn 2007 odor that plagued me, my hypothesis—conviction, really—was this: there was a decaying human corpse somewhere on the south side of my property, and

SOME RIGHTS RESERVED

relatively near the house. Once I reached that conclusion, all I wanted to do was pick up the phone and call the police to get them over here to search, find, and remove the corpse. I wanted that nauseous odor exorcised from my morning air!

I delayed that gratification. It was still quite early, and my son was still asleep. The hubbub of a search party tramping around outside would be a rude way to wake up. I would wait to call the police until Paul was up and I could tell him what was going on.

A couple of hours later, that time came. When I told him about all this, the first thing he did was open his south-facing bedroom window and sniff the air. It smelled like great, fresh autumn morning air to him. I was shocked! Maybe the breeze had shifted and was temporarily blowing the odor away from the house. We headed outside so he could smell the same awful thing I smelled. While I was doing everything in my power to not retch at the horribleness of breathing it in, Paul was consistently shaking his head and saying, "No, I don't smell anything. Are you sure this is where you smelled it? Are you sure you smell something?" Why couldn't *he* smell it? What kind of turnabout was this, anyway? The whole experience began to feel incredibly surreal.

My sons are notorious in this family for humoring me. Paul performed marvelously. Despite his conviction that it was ridiculous to think there was a rotting corpse nearby, he asked what places I thought it might be hidden, and offered to do a search. But first he had to head to campus for classes. He couldn't start the search till afternoon. He extracted my promise to not call the police until he got back and could do the search himself, first. He was determined to spare me (and probably himself) having the police search party decide I was a crazy old lady and have a good laugh at my expense. Not to mention that all of that would be at taxpayers' expense!

Sauntering into the house after class that afternoon, Paul announced with a big grin that he was ready to go find a dead body, and headed outside. A bit later, he came back with the report that there was nothing anywhere and still no odor. We looked at each other. He was grinning from ear to ear. I wasn't. Surely with a very furrowed brow, I was in a state of severe cognitive dissonance! I had to admit, upon a moment's reflection, that the smell had faded sometime around noon, and now it was mid-afternoon. If there were a dead body outside, it certainly would not stop stinking as the sun got higher and warmer.

"Okay," I admitted, "there must not be a dead body. There must be something wrong with my nose." We broke into hilarious laughter at the ludicrous drama I had created. Laughing while shaking my head, I was still mystified. Good grief! How did I concoct something like this?

Just as earlier that morning I had had to come up with some story that would make sense of the horrible smell, by now in mid-afternoon, I had to come up with a new story to explain why the dead body story didn't work. Damn, what a crazy way to spend a day! I could not let this dissonance go unresolved.

The next story I came up with made sense, literally. It was about my sense of smell. I remembered I had had a first-time-ever allergy attack two or three weeks before this. It started right after doing some autumn grass mowing. For two days, I had all the allergy symptoms I had always heard about and never suffered. Then it turned into a sinus infection that seemed to last and last. Somehow, I figured, by that morning, the status of the sinus infection must have changed, and a different chemistry was playing out. It must have interacted with the air from a perhaps overnight development of a certain musty-moldiness in the woods, and resulted in a yet more different chemistry in my sinuses. Voila! Combined with my recall of local history, I constructed the explanation of a dead body outside!

What message—or messages—might be writ large from this little story? The commonplace saying that "perception is reality" is not only figurative, but literal. My nasal system activity proved it. I treasure that proof for its concreteness. I have decades' worth of experience of living out of different worldviews, and am intimate with the use of multiple stories to interpret the world, events, others, and myself through those different lenses. These are more abstract experiences. But here, my distorted sense of smell taught me *afresh* (oh, how I wish that air had smelled fresh!) how really real, concrete, and seemingly indisputable our perceptions of reality—and therefore our perspectives on reality—can seem to be.

Someone who told me about a trip on acid reported the same sort of insight: on acid, the manifest world of sky and land and trees and buildings did crazy things that defied all laws of physics and thermodynamics. After the trip, the "normal world" of every day became merely another perception, held lightly, without attachment, no longer assumed to be "reality" but rather, mere likely-transitory perception.

What would our personal, interpersonal, and larger-scaled social and political dynamics be like if we all realized that what we perceive in self, others, and the world was not necessarily so? What kind of transformations might result?

My hopeful hypothesis is that many would discover how essential it is to become earnest inquirers into our own and others' experiences: question-posers, answer-seekers, and assumption-disrupters who assume little but discover much by asking questions, by probing our experience, by doubting both our senses and our sense-making, by questioning the stories we tell ourselves about how we, others, and the world work. Dare we imagine that?

What further kinds of transformations might result from that sort of transformation? Ahhh…. I can think of multitudes of behaviors and assumptions that would find replacements, in such forms as co-constructed, multi-faceted versions of many diverse persons describing "how it is, what it is, from my perspective." Dare we imagine that?

And what kinds of transformations might result from *those* sorts of transformation? Ahhhhhh…! We would learn how to tango[1] with our multi-faceted selves and our multi-faceted fellow beings in our families, organizations, communities, regions, nations, and natural world. We would learn new dance steps and dances to tell ourselves new stories about how we work our world and hand us mirrors to see how our stories tell us. Dare we imagine that?

---

[1] For more about these dynamics, see Ross, S. N. (2005). Toward an integral process theory of human dynamics: Dancing the universal tango. *Integral Review 1,* 64-84. http://integral-review.org

And what kinds of transformations might result from *those* amazing transformations? A-ho! We would name how we must work ourselves in our world differently and actually do so. Dare we imagine that?

After the trip, the "normal world" of every day became merely another perception, held lightly, no longer assumed to be "reality."

How Then Do We Choose to Live?
Facing the Climate Crisis and Seeking "the Meta Response"

Jan Inglis

Abstract: The author observes that a sense of hopelessness appears to be forming in our culture in response to recent descriptions of the impact of climate crisis. This reaction is compared to the way people respond to diagnoses of life threatening illness. Stages of reactions to difficult news are known to accompany such responses. The author shares her own sorting of responses as an example of stage transitions in the process of grappling with the difficult news of climate crisis. Transitions from one stage to the next are developmental. The importance of bringing resources from the field of adult development into the field of public deliberations to address the climate crisis is emphasized. A meta approach, "the Gaia approach," is proposed, as are many questions for individual and public reflection.

Keywords: adult development, climate crisis, deliberation, developmental, Gaia approach, meta approach, stage transition processes, complexity

Introduction

This article shares observations about and reflections on the progression of peoples' responses to climate change. Here, climate change includes the associated challenges of ecological overshoot, overpopulation, peak oil, and political economic instability. Although originally I had not planned to write a series, this article does appear to be a sequel to my essay in the December 2007 issue of *Integral Review, Reactivity to Climate Change* (Inglis, 2007). In that essay, I observed how it seemed that a tipping point had been reached and a shift was occurring. The shift was from the disbelief that there could be a climate change crisis, to a widely-accepted belief that there would be such a crisis, and thus a belief that corrective responses were needed. Now, scarcely five months later, I am writing about my observations that many people are feeling it is too late to turn the tide of devastation. This indicates a belief that the crisis is growing exponentially and cannot be averted. What a rapid leap ─ from acknowledgement of the existence of a planetary crisis to resignation that it is impossible to do anything to make a difference. Some have noticed there are different reactions in various regions of the world. Some have likened this range of differences and acknowledgments of the situation to being on the Titanic, recognizing or experiencing the crisis at different times, depending on the class of berth inhabited on the ship (Baker, 2008).

Voices of Resignation

One woman I spoke with the other day said that the human race should die off, because it had messed up the planet so terribly. I asked how that was for her, to think that way in view of the fact that she was a new, proud grandmother. She said firmly, "I just don't think of it." A friend, a

SOME RIGHTS RESERVED

father of two who has been an active environmentalist working to protect water quality and wildlife habitat, told me the other day that he feels that his last 30 years have been a waste. He said he is getting older and wants to focus now on taking care of himself, travelling and enjoying the things he can while he still has the health to do so. Renowned scientist, author and futurist, James Lovelock, is saying nothing can be done to avert the catastrophe. Forty years ago he proposed the Gaia Hypothesis, indicating that all living and non-living aspects of the earth form a complex, interacting system. This system can be thought of as a single organism. Now, based on his and others' research, he is saying that as soon as 2040, much of the Earth's current population of 6.6 billion people will be culled. By the end of the century, he forecasts, only about 500 million will be left hanging on to life by living in the cooler latitudes of the planet.[1]

At the institutional level, the United Nations' Intergovernmental Panel on Climate Change, considered by some to be conservative in its estimates, is saying that we have only three to five years to reduce greenhouse gas emissions, after which it will be too late to avert climate change. It forecasts the devastating heating up of both land and oceans by 2°C, resulting in the extinction of at least 30% of plant and animal species mainly due to flood, drought, storms and disease. Behind the "too late" assumptions are the analyses that the amount of carbon already emitted into the atmosphere will remain for several generations. It forms a heat-trapping, life-threatening greenhouse roof over the earth. It is predicted that further emissions will result in temperatures rising by 6°C. Just as in our bodies, even a slight rise in temperature in the atmosphere disturbs the delicate balance required to maintain interdependent life systems. Such a rise would result in a 70% species loss by 2100.[2]

Even when confronted with such scientifically-based information, we see little organized response that seems to have any potential to reduce the use of fossil fuels. The topic of climate crisis, peak oil, food and water shortages, or other associated challenges are barely mentioned in the campaigns of US presidential nomination-hopefuls. People do not seem to be clamouring loudly for attention to climate change in those campaigns, either. Many people are versed enough on this issue that they do not want to be handed simple or optimistic platitudes. However, in the absence of leadership offering grounded-in-reality comprehensive approaches, it is hardly a wonder that there is a sense of hopelessness developing. This hopelessness seems to be named by those who simultaneously continue to participate in the collective "business as usual" mode. On one hand, dire hopelessness, on the other, no change in behavior to alleviate the problems driving the hopelessness. A crazy-making mixture! And for those who do express hope, saying that something will surely emerge, there is little clarity on what that emergence might look like or the detailed steps needed to bring it into effect.

Processes and Results of Coping with Difficult News

This prognosis is stark. It is incomprehensible! It is also so vivid and apocalyptic that it can focus our attention and frame our beliefs. I am noticing even as I write, how this dark cloud of absolutist doom can be compelling, overtaking my sense of other life options. I may have taken you, the reader, into this cloud with me. It can spread, become pervasive and self-generating. In this dark light, it could make all of our efforts in all kinds of fields of endeavour seem irrelevant and futile. How then do we choose to live? How do we define motivations and priorities in the context of possible mass extinction?

It is hard to talk about the possibility of this catastrophe, just as it is hard to talk about the prognosis of terminal illness. It is hard to write about it. It may be hard to read it. However, not opening this topic for direct attention, and in a publicly shared manner, would cut off the opportunity to engage and catalyze new perspectives and actions. Several years ago it was common practice for physicians to not tell patients they had been diagnosed with a terminal illness. This information was withheld out of fear of upsetting patients or their families. This was a paternalistic approach to physician-patient communication. More recently, this physician-patient relationship has changed from one of paternalism to one of respecting and supporting the patients' needs and rights to know about their health status (O'Rourke, 2000). In the Western world, the topic of death now has less taboo associated with it. This contrasts to years ago, when people died in relative isolation. As they went through the dying process, their loved ones mostly carried on in a "business as usual" mode. This was not for lack of caring, but for lack of knowing how to navigate such vulnerable and unknown territory. Often the inability to share this poignant journey became as painful as the physical dying itself. A cultural change is evident as hospices and conscious dying processes are becoming more widely available and publicized.

It is one thing to contemplate one's mortality from the abstract distance of years in the future. It is a different thing to have it take on a closer, more concrete reality within a possible two to three year time frame. Accepting death sits in tension with wanting life. There are almost as many ways of responding to this tension, as there are different people. Some wish to avoid the tension and do not transition beyond the overwhelmed feeling of shock. Yet, there are also stories of other people, who in the process of dealing with this tension, have shifted from the daily habits of a life they used to take for granted, to an awakening of aspects and experiences of themselves and the world that they had not observed before. Some have been thankful to have this wake up call; it allowed them to appreciate and therefore live the last part of their life with a fuller consciousness, redefining what a good life is. For some, this shift in perception has extended their life, and for others, it has even changed the diagnosis of their health status and its prognosis.

Can the intense work of noticing, sorting, prioritizing, and reconciling choices actually transform an individual's biological, neurological, cognitive, and emotional patterns and thus allow a more integrated pattern to emerge? Many studies, including those on brain plasticity (Doidge, 2007), would suggest it can. This process, then, of confronting difficult news about personal survival can have generative impacts resulting in life-changing qualities and even transformative outcomes. What might we glean from this?

Towards Making Connections and Synthesizing Directions

The transition process of moving from hopelessness or denial to changes in attitudes, behaviors, and assumptions has been observed in numerous studies of "the grieving process" and by many who have companioned dying persons and their loved ones. Widely recognized, this is a nearly universal, if not truly universal, human process of adapting to new circumstances and arriving at new insights. I suggest this model of stage transition (see Commons & Richards, 2002), which describes the process individuals use to sort responses and make decisions, offers us a way to understand the universal, developmental stage transition and cultural decision-making.[3] To step back and to view this process as a natural developmental transition process offers a perspective from which to make sense of the divergent often confusing mix of thoughts and feelings that arise on the road to resolving angst.

It seems important to bear in mind that the prognosis of climate crisis is based on current perceptions and projected outcomes. We arrive at these based on our assumptions of what would continue to occur in a linear logical manner as a result of known conditions, actions or inactions to date. These assumptions may not be taking into account the impact that clear consideration ***of*** these projected outcomes might have ***on*** the outcomes themselves. This self-reflective inquiry creates feedback loops, and learning. These in turn can potentially generate new, yet unseen options and adjustments. These adjustments could alter the course of the prognosis.

Observing myself in this process of viewing the climate crisis offers a place from which to inquire and reflect. When I can do this, I am not so embedded in this prognosis as the only truth. This reflective analysis allows me to move beyond the either/or dilemma, i.e., either rejecting the climate change prognosis or just accepting the hopelessness of it. I am not able to reject it because I can see the legitimacy of this information and am not willing to put my head in the sands. Nor am I able to accept a life with no hope and impotent action, because I am not willing to live without trusting the power that observing, learning and choosing has on producing more satisfactory outcomes. This analysis is fed back into my original response to the stark climate crisis prognosis. Based on this feedback loop I realize I have to adjust and move beyond this unsatisfactory and stuck either/or position, and search for new and broader options.

This searching leads me to recognize that I although I see and accept the situation, if I labour under an assumption that I can create change of this magnitude alone, it is counter productive. I feel the necessity to engage with others who are willing to grapple with this challenge. I also recognize that this is not just your run of the mill, everyday quality of grappling. It means high stake investments of commitment and focus. It requires us to pay attention to both the personal (be self-reflective of one's own experience), the interpersonal (work with what happens between us) and the global (notice patterns of systems within systems). It also requires us to be specific about what we have to grapple with and not get lost in abstract concepts. Then efforts can result in co-designed meta approaches (Ross, 2008) to undertake potent, rather than impotent, action. Through my sorting process, of generating and weighing out options, I eventually arrive at an acknowledgment that for any of us to assume we can resolve this issue without the generativity of diverse minds working together could breed a futility of its own.

---

[3] Stage transition outlines the decision making process as it moves from the original thesis (yes, this is true), to antithesis (no, it's not), relativism (yes or no), smash (many additional options to weigh) and finally synthesis or resolution (ahhh, this is it).

The hopelessness or avoidance I have been noting in response to the climate crisis may be signs of being stuck in stage transition, unable to create and weigh out new options. Being stuck when facing a crisis does not gain us evolutionary points. How can the use of adult development theories and research on stage transitions help us move out of this stage transition stuckness? Because the crisis is a complex, interconnected planetary issue, no single individual, group, corporate conglomerate, government, or international agency will be able to solve it. It is necessary to build structures for public interactions that match the complexity of the situation and support the quality of outcomes we want to achieve (Inglis, 2007). These interactive processes need to support diverse minds working together to co-design and weigh out new meta options. If these processes are designed from an understanding of the developmental diversity of adults, they are much more likely to support the quality of shared meaning making and deliberative decision making required to create comprehensive responses. In this way, I propose that knowledge gleaned from theories of adult development and adult learning have much to offer to the work on climate crisis. My concern is that there seem to be few who employ such theories in specific, on the ground, initiatives in this climate crisis domain. In general, the related fields of public policy, dialogue and deliberative democracy, and the related fields of adult development and learning appear to be standing as surprisingly separate silos. I advocate for dismantling these and many other such silos that limit our ability to see and work with the whole. I also advocate for and even predict that a new integral field of public issue analysis is ready to emerge. Through being comprehensively structured, it can potentially move us beyond those limits and support more effective approaches to our complex challenges.

A plethora of books, movies, and programs focusing on climate change is suddenly available to us, but few of them are informed by empirical research into adult development. Many attempts to explain why we have created this desperate crisis blame our stupidity as a species, for example, for having moved from being hunter/gatherers to being agricultural users/abusers of the earth. Or they blame us for being mesmerized by illusions about the industrial or technological revolutions.[4] Both anthropological and adult development perspectives view these phases of evolution and societal changes as natural progressions, each building from the necessity to learn from and adapt our behaviors, attitudes, and systems to overcome the unmet demands of a previous phase. Through the process of development, limitations are reached within each stage. Although we can see these in hindsight, we could not have skipped going through these progressive stages at the time. There is little justification, then, for blaming the species for doing what a species does by its nature, or for thinking we can go back to and live the way we did prior to these phases.

Moving beyond the tendency to lay blame enables us to see that the challenges and limitations can only be resolved through deeper grappling with them. The experience of limitations is what motivates the search for what would overcome these limitations, and build the next adaptive stage. As a species, we had only fragmented views of what we were doing in the agricultural and industrial revolutions. At the time, they seemed like great adaptations to the limitations of the previous phase. We had no world wide web then. There were no wide scale, collective-engagement methods to gather and consider information, track feedback loops, and form a shared picture of what destructive patterns we were creating.

---

[4] See an overview of the recent film *What a Way to Go: Life at the End of Empire* produced by Tim Bennett and Sally Erickson (2007) and book *After Eden: The Evolution of Human Domination* by Kirkpatrick Sale (2006). http://www.relocalize.net/blog/molly_brown

But now, in the communication era, with life conditions that support further individual, cultural and technological development, many of our previous communication and information limitations have been overcome. Now, for those living in such conditions, a meta picture is forming about our human and technological evolutions. This understanding is available for us to apply to this situation. If we had known better back then, we would have done better. We do know better now, and we have the option therefore to do better. We can feel the life threatening limitations of the phase we are currently in. We need to move beyond the taboo against discussing these threats, grapple with them in a publicly supported manner and be pushed by them to adapt. As a result, if we are motivated, we can potentially change the trajectory of the crisis.

Diverse Minds Seeking Meta Approaches

Currently there are almost as many different perspectives on the climate crisis as there are people. These perspectives have tensions and trade offs associated with them that need to be surfaced and publicly deliberated so we can make decisions we are willing to live with. The following recounts some of the most prevalent perspectives I have researched and observed to date from various sources (Inglis, 2008). For some, protecting their own community is the best approach to the impending peril: growing food, conserving water, living simply, and independently gives a sense of power as it offers something concrete to do.[5] One consequence that would need to be considered in this approach is how to deal with the influx of environmental migrants, which could threaten the desired sustainability, and possibly trigger a militant form of protectionism. Through a different lens, some look to government to provide order and to develop and enforce corrective policies and structures. A consequence of taking this approach could be the slowness of government to respond and the distrust in leaders' ability to grasp the severity of the issue. From yet another perspective, some believe that many kinds of innovations and new technologies will offer creative strategies to solve the dilemma.[6] A consequence, which would need to be considered with this approach, is the unintended and often harmful results of short sighted and often short-term disconnected technological fixes. These trigger reactive suspicion of modernity in general, so incur resistance. Finally, looking through another perspective, some feel that deepening a sense of connections to each other and all living things will inspire less destructive ways of inhabiting the planet. A consequence of this approach is that it lacks details of how to coordinate and implement this inspiration into concrete steps that effectively impact the issue. A further consequence is that the sensitivity and large vision this perspective promotes often turns off those whom it hopes to include and therefore also incurs resistance.

---

[5] Much of this approach is happening under the name of "relocalization" and information can be found at http://www.relocalize.net/about/relocalization (Accessed April 2, 2008). Justification for guerilla type action are described at http://www.geocities.com/~dmdelaney/what-to-do-in-a-failing-civilization.html (Accessed April 2, 2008).

[6] Ray Kurzweil, inventor, author and futurist states with optimism that he is confident that the acceleration and expanding capacity of information and nano-technology will solve, within twenty years, the problems that now preoccupy us.
http://www.kurzweilai.net/meme/frame.html?main=/articles/art0692.html (Accessed April 2, 2008).

These are all very different and very legitimate perspectives, each accompanied by implications. Movement forward is often blocked due to the competition between the ideologies of these approaches, each blaming the other for causing the problem. This paralysis is another example of the stuckness in stage transitions we need to be aware of and respond to. As mentioned earlier, being stuck when facing a crisis does not gain us evolutionary points and it is definitely a limitation we need to surmount in our current climate crisis. A meta approach designed from an adult development perspective could include these diverse voices and coordinate their multiple action responses to enable moving forward in a comprehensive effective manner (Ross, 2008).

Looping back to Lovelock's Gaia Hypothesis, is there a way we can integrate our diverse perspectives to function like Gaia: to knowingly *be* a complex interacting system of biological, geographical, cognitive, spiritual, scientific, political, emotional, and technical subsystems? What would a Gaia approach look like? If we put it in place now, could it allow many to not only survive, but evolve and thrive through and after the climate crisis?

It would mean acting out of a coherent synthesized meta response, not out of a stuck or chaotic transition stage described above. It could mean coordinating local sustainability initiatives with effective policy and structures (mentioned earlier), while creating, testing and distributing innovative technologies, with a sensitivity to our impact on others, locally and globally, human and non human. Are we capable of moving beyond our personal shock, disbelief, and hopelessness, beyond concern for the well being of just our descendants and communities, beyond our various ideological stances, beyond the dislike of sorting through tensions and attending to details, to thinking and acting like interdependent species? Are we motivated to overcome the limitations of this stage we are in right now? I believe in this motivation lie many possibilities to take us beyond the option of hopelessness to a response Gaia can live with.

Appreciatively Critical Reflections on a Retreat with Adyashanti

Grady McGonagill

With an Introduction by **Bill Torbert**

and with
Another Step in the Walk of a Thousand Hills, I and *II*
by **Andrew Campbell**

*Editors' not*e: This reflective essay by Grady McGonagill is introduced below by inclusion of the cover note Bill Torbert used to circulate the original version of the essay among colleagues he thought would be interested. Both Bill and Grady have agreed to this combined publication. Grady also welcomed the inclusion of IR Arts and Creativity Editor Andrew Campbell's art, inspired by this essay. For readers' information, Grady also shared a version of his essay with Adyashanti, inviting his reflections or reactions that could be included with the essay's publication. Although to date, Grady has received no such response, he, and we, believe it is important for readers to know that opportunity was extended.

❧

January 2008

Dear Friend,

I am sending around, to good friends with a spiritual orientation, this essay on a contemporary young guru's conference, written by my friend and fellow inquirer, Grady McGonagill.

I am forwarding this short essay because it seems to me exemplary in terms of the sort of appreciation/critique that a dedicated action researcher can offer. It is attentive to the single-, double-, and triple-loop feedback generated by his own perceptions and actions, and attentive as well to the mutuality (or lack thereof) evolving in a given situation. Therefore, it seems to me, the essay has potential value for the person writing, for other participants in the event itself, as well as for others engaged in spiritual inquiry.

In a more general way, this vulnerable, self-disclosing case study seems to me to highlight the inevitable paradoxes and outright incongruities that occur whenever someone takes/accepts a guru-esque role and claims to profess "the true way" to others who are but seekers. At the same time, the essay illustrates how any such sense of critique must lead to creative action on one's own part if it is not, itself, to fall into hypo-critical self-contradiction.

SOME RIGHTS RESERVED

I suggest that more participants in activities intended to be spiritually, politically, or scientifically transformative share self-observing tales like this with the initiators and other participants of the event, as well as other interested parties.

With best wishes for the New Year,
Bill Torbert

* * *

April 6, 2008

Given that for several years I had been seeking an opportunity to participate in an extended retreat with the meditation teacher who calls himself Adyashanti, it came as a surprise that when a chance finally came—at the Asilomar conference center near Monterey California, in December 2007—I decided to leave early. Like other participants, I had made a commitment to attend the full 5-day retreat. However, I left on the morning of the 4th day. One way to explain this is I was disappointed with my experience. Another, equally true, would be to say that I got what I came for and awarded myself an early graduation certificate. Still another would be to say that I got more than I came for, namely insight into my motivations for attending such a retreat and some of the underlying patterns of which that was an expression. These notes offer reflections on that experience and a preliminary report on what appears to be a resulting substantial impact on my life.

There’s much that I find admirable and attractive about Adyashanti. I was initially drawn to him by his approach to meditation, which is very non-directive. He writes, “True meditation has no direction, goals, or method. All methods aim at achieving a certain state of mind. All states are limited, impermanent and conditioned. Fascination with states leads only to bondage and dependency.” As someone who had always had great difficulty with efforts to achieve something in particular in meditation, such as maintain attention on the breath or strive for awareness free of thoughts, I found this perspective liberating.

Despite the pretensions of his name, (Sanskrit for “primordial peace”) Adyashanti encourages people to call him “Adja.” He reports with amusement that his audience tripled when he switched from his given name (Stephen Gray). He trained for many years as a Zen Buddhist with Arvis Joen Justi, a (female) student of Taizan Maezumi Roshi of the Zen Center of Los Angeles. But he left this tradition and has gone out on his own. His retreats are now in such demand that access is by lottery. There were 350 people at this retreat.

Part of his appeal results, I think, from his presenting himself as a kind of “regular guy,” one who enjoys playing cards, riding his motorcycle, and watching sports on TV. He sits in a comfortable chair rather than on a traditional mediation cushion. And he says he does not like burning incense or doing other conventionally “spiritual” things—all in all, a very “non-spiritual” spiritual teacher, in his own words. Consistent with this image, he disdains many of the formalities and rigors of Zen practice, such as maintaining a rigid posture even to the point of intense pain (he reports that such practice led him to do serious damage to himself by tearing a ligament). And he has little patience with the hair-splitting ideological wars within different schools of Buddhism or among other religions. For example, early in the retreat he made fun of the mindset that led one school of Buddhist thought to refer to itself as Mahayana ("greater way") and the preceding tradition as Hinayana ("lesser way"). Similarly he mocked the tensions between the "gradual awakening" and "sudden awakening" schools of Zen which was very amusing. And he couldn't resist making a joke of more innocuous traditions, such as the practice at many meditation retreats of "eating abnormally slowly."

The teaching style on retreats, if this one was typical, consists of meditation (he distributed a handout entitled "True Meditation" but didn't talk about it much) and "satsangs"—one in the morning and one in the evening—two hours each, of which part is lecture and part is taking questions from participants who come forward and stand at a microphone. I found more than a few nuggets of wisdom in the presentations. For example, I found him particularly compelling on the meaning of "non-dual," which he portrays as a full embrace of two worlds, one relative, one absolute, not just an ascendance into the absolute. He drew on unusual sources on this point, quoting the bible ("the fox has his hole, the bird its nest, but the son of God has no place to rest his head"). He often brought in good quotes: e.g., "When I look inside and see that I'm nothing, that's wisdom. When I look outside and see that I'm everything, that's love. And between these two, my life turns" (which I've since tracked down: it comes from Sri Nisargadatta Maharaj.) And he told good stories. One contrasted two different Buddhist teachers in the way they responded to women who had just lost their husbands. One (unnamed, presumably contemporary) teacher responded by telling the woman that what she experienced as pain was all just a "story" that she needed to let go of. The other (named something like Papaji) walked over to the woman, put his arms around her, and held her as she cried. Presumably there would be time for a conversation about the "story" later. Adyashanti's preference for the latter response reflected an intuitive practical wisdom about how to apply Buddhist teachings that was often evident. In this case he mused, "I wish I had been in the room with the first teacher, with a large object in my hand, which I would have loved to have thrown it at him, and then asked, 'Who's feeling that pain, Mr. Nobody?'"

On occasion he also responded to questions in a way that I found compelling. For example, one woman reported with dismay that she had cut herself off from events in the world because she found all the rapes and violence too painful to let in. She felt herself to be both sensitive and cowardly. He suggested that she had in fact already let the world in, and was deceiving herself that she had not. She agreed. He asserted there was a true self in which there was room for all the pain in the world. He could see in himself, for example, all that which appeared as evil in the outer world; he invited her to imagine that so could she. She was able to make sense of this in terms of Jungian psychology, with which she was familiar, along with the notion of projecting outward repressed thoughts and feelings. And it seemed to be helpful to her to realize that in fact she had not shut things out as fully as she imagined. She seemed to go away satisfied. At other times he played the role of cognitive therapist in the style of Byron Katie, with a dash of humor. To one person he said, after listening for a few minutes, "OK, This is the part where you tell me your story and I ask you, 'Is it true?' I'm giving you the McDonald's drive-through version of spiritual growth."

Although this way of thinking was not new to me, one valuable part of the retreat was that I was able to take advantage of the uninterrupted time to apply some Buddhist-influenced cognitive therapy to myself, clarifying particular stories I was telling myself and asking if they were true. For example, I discovered on arrival at the retreat that I was experiencing a relapse of a fatigue syndrome that had immobilized me 25 years ago but which I had managed to keep in check during most of the intervening time. However, this was the 3rd relapse within 6 weeks and I found myself quite depressed about it. I decided to deconstruct the thinking process leading to the depression. Here is the chain of thinking I identified:

- "I will never get better."
- "If I never get better I will not be able to make the contribution to which I aspire or fully realize my values."
- "If I don't do that, then my life will not have been worthwhile."

Looking at this story with the intensity and detachment possible in a retreat, it seemed less than fully true. I began to sense the value of accepting the possibility that I might not get better. This led me to decide to conduct an experiment, to declare that my life was "over" (much in the way that a financial institution might write off sub-prime loans). I even mentally rehearsed my own epitaph, and decided that I could "live" with my life being effectively over as concerns anything productive. From this perspective, any additional day was grace. I could make of it what I wished, without feeling burdened to achieve anything. Somehow this felt very liberating. So although I never approached the microphone myself to seek direct counsel from Adyashanti, I was able to use the experience of the retreat to work through issues like this in ways that were inspired and supported by the retreat, which I presume was the aim of the "satsangs."

But although there were a number of exchanges that seemed productive and some that I found personally helpful, at many other times I felt troubled by the interaction between Adyashanti and the people who came forward. Many described their problem in such abstract terms that it was hard for me to understand what they were asking, and equally hard for me to imagine that he understood them either. Sometimes the description didn't go beyond metaphors, e.g., "I'm like a dog that won't let go of a bone, and the bone that I'm chewing on is my own leg." In this instance Adyashanti deftly invited the speaker to consult his own inner wisdom, which seemed to work very well, and didn't require that the teacher understand the literal content of the metaphor. However, in most cases he began offering commentary, often without asking questions, or very many questions. Rarely did he ask for concrete examples. Instead he tended to move quickly to dispensing advice, sometimes even before a question had been posed. I often found the advice to be quite abstract and as unclear as the questions. People usually reached a point where they seemed satisfied, but I wondered whether they felt too embarrassed to say that they, like me, didn't get it. (I recognize that these critical observations would carry more weight if they were supported by concrete examples, but I failed to note any at the time and couldn't recollect any later. I recognize that others might have interpreted the interactions differently).

I also found myself troubled by Adyashanti's use of concepts to explain his approach. Although I liked his approach to meditation, I was less fond of his name for it: "true" meditation. Doesn't this name imply that other approaches are not true, or less true? And if so, isn't Adyashanti doing precisely what he criticized others of doing when they declare their approach to be "better"? To his credit, he more than once said, following the Buddha, "Don't take my word for anything. Try it out in your own experience." But some of his teachings are so abstract that I find it hard to imagine how I, or anyone, would test them out. E.g., his definition of "true meditation" contains a number of sentences like the following: "Silence is the non-state from which all states arise and subside." I have no idea how I would find out through my own experience whether silence is a "non-state." How indeed could I determine whether/how a non-state is different from a state? Most troubling of all, one person asked him whether his approach depended on beliefs. Among the things he said in response was: "beliefs are about things that you aren't certain are true. If you know they are true (for which he gave the example, 'that I am speaking into this microphone') then they aren't beliefs, rather they are 'truths'." I found this a deeply disturbing assertion. Apparently he would have us see his approach to spirituality as consisting of "truths" rather than "beliefs." This suggests that he regards his own approach as self-evidently true and beyond dispute, presumably in contrast to other systems, which are based on "beliefs" that can be challenged. If I heard him correctly, he would seem to be taking a self-righteous stance not unlike that for which he had mocked other traditions.

On the second and third days of the retreat I spent a surprising amount of time and energy preoccupied with criticisms of this kind. I wondered whether to take them seriously, or simply as an expression of an overly-developed skeptical part of myself that often emerges during retreats and workshops (not to mention elsewhere in my life), which I am working to manage in a way that is less reflexive and more intentional. At one point I sat for three hours without interruption, and realized that I had spent over half of the time mentally rehearsing different ways of framing a challenging question to Adyashanti in front of the group, trying to strike the right balance among humility, curiosity and challenge. What an astonishing expenditure of energy! It became clear to me that by focusing on these criticisms I was directing my attention away from many other things that could be a source of learning, such as my fear about letting go of narrow constructions of my identity in order to engage the mystery of being and have the faith to tolerate the awful and magnificent uncertainty of a vast, unbounded and not fully knowable universe.

I was moving toward just letting these thoughts go and trying to redirect my attention away from comfortable criticisms of Adyashanti and toward less comfortable but potentially more generative self-inquiry, when on the night after the third day I had a transformative dream. In the dream I was making my way up a steep incline, pulling myself through underbrush, when I passed by an old rusting automobile. On the left fender I saw, to my delight, a pair of glasses that I had lost in my home a couple of months ago. I took the glasses and proceeded up the hill with a palpable sense of well being. As I recorded this dream in my journal, I recalled that earlier in the night, before going to sleep, a line from a Bobby "Blue" Bland song drifted through my mind: "There's no one blinder than he who won't see." Putting these two things together, I had an epiphany: "I can see! All I have to do is put on my glasses! I don't need to be huffing and puffing up the hill, struggling through the underbrush (i.e., my struggle with a tendency to be critical of the retreat). I already know enough to be able to do what I need to do on my own." I felt exhilarated by this insight, and went back to sleep happier than I had felt in some time. Early the next morning, walking along the Monterey Beach, I mulled over what to do with my insight. Should I make it public in one of the day's satsangs? Or perhaps pose a question about my criticisms, balanced by my insight? It occurred to me that my conclusion was very consistent with Adyashanti's teachings: "You are already awake. You just need to realize it. You don't need to do anything. You don't even need a teacher." As I mused on the possibilities, and enjoyed the sound of the surf, the thought hit me: "I don't need to sit through any more of this! I could be home this evening! I don't need anyone else's knowledge or approval or permission. I got what I needed and I'm out of here." Within little more than an hour—but, I confess, more than a little perseveration—I made the necessary arrangements and was on my way to the San Jose airport.

As I travelled, I added another layer of interpretation, building on some other "chance" experiences. I had found a pocket knife in front of the bungalow where I was staying. And by "coincidence," behind him on the stage, Adyashanti had a statue of a Tibetan deity—Manjusri, the bodhisattva of wisdom and awareness—wielding a sword, a symbol of "cutting through bullshit" he said. Linking the found knife with the sword, I saw myself as cutting through the illusion that I needed something outside myself to be complete, to gain insight. And this lesson did not apply just to Adyashanti. I saw my whole orientation toward spiritual seeking as being driven by an underlying assumption that I was inherently deficient, incomplete, and needed to fill myself up with something from the outside. I had been aware of this pattern for some time, but unable to put it in perspective and let go of it. At last, I had an emotional footing—a message from my unconscious in the form of a dream, reinforced by the synchronistic metaphor of a sword—from which to cut through and let go of that limiting belief.

And then a deeper level of insight emerged. Although it was only during the retreat that I became critical of Adyashanti's teachings, I realized that I had more than enough evidence beforehand to have aroused my suspicions. I had known that he called his approach "true meditation," for example. And I recall reading the definition with the abstract language a few weeks earlier, and thinking, "Hmmm, don't know about that." Why had I ignored those clues? I decided that I had fallen victim to my yearning for a teacher who would point the way to enlightenment, teach me about how to attain it. Although I am sufficiently skeptical that I don't easily allow myself to indulge these yearnings, or attach them to anyone, Adyashanti had gotten through my first level of defense with his non-directive approach, reinforced by strong endorsements from several people I know and respect. I had then become all too willing to give him benefit of the doubt. I was guilty of overlooking disconfirming evidence to serve what I wished to see—something that drives me crazy when I see other people do it! Very humbling. Very eye-opening. Another step in the walk of a thousand hills, the never-ending trek toward self knowledge. All in all, well worth the price of admission to the retreat. The irony being that although I learned that I didn't "need" to go to the retreat, in fact I had to go to learn that, and something about Adyashanti's way of being/teaching may in fact have made this insight possible.

Epilog

In contemplating these reflections as I wrote them, I found myself wondering whether the insights would have a lasting impact (evidence of playing a "larger part"), or merely be a set of intriguing but ephemeral epiphanies (for which I had ample precedent in my life). The evidence so far—two and a half months later—is mixed but encouraging. On the disappointing side, I find that little remains of the perspective in which I had made my peace with thoughts that I had to do still more for my life to have been worthwhile. It surprises me to note this, as I had returned from the retreat quite excited about this perspective, and talked it up to friends. But a deeply ingrained achievement-oriented mindset has settled back in. To be sure, when I now notice self-critical thoughts about my declining abilities, I recall the exhilaration of being able to step out of that mindset at the retreat. But it now seems a dim and distant perspective, not one that I have internalized. There is probably some value to that memory as a benchmark of an alternative perspective, but I suspect it would take far more work of that kind, or reinforcing work of a different kind, to fully integrate new thinking into my consciousness.

Far more encouraging are several indicators of an increased inclination to act. I acted in three ways in the aftermath of the retreat that I believe were influenced by the retreat and my reflections on it, although they were probably also an expression of shifts that had been percolating for some time. First, within a few days of my return, I signed up for some volunteer activity. I had sensed for some time that I would do well to put more energy into "giving" in addition to "searching," but had dismissed the impulse on the logical grounds that my professional work was about giving and that in any case I tend to make substantial financial charitable contributions. But now I made a specific commitment to do something humble and concrete—spend a Saturday putting together Braille books for blind children. Moreover, I've noticed since then an increased tendency to act on feelings of compassion for others. Second, it became clear to me that I needed to "wield the sword" within my family, to cut off my youngest brother from his continuing financial exploitation of my 86-year old mother. Within a few days of the retreat—and in collaboration with my sister—I found a way to do this.

Finally, and most significantly, after three weeks I decided to initiate the deepest cut of all: separation from a marital partnership that had been stuck for many years. This was the hardest decision I've ever made; indeed, I unmade and remade it a dozen times over a period of several weeks. Taking this step—like leaving the retreat early—could lead to breaking a vow ("until death do us part"). But in deciding to cut through my long-standing indecision in this area I was inspired by that moment of knowing on the Monterey Beach when it became clear to me that it made no sense to feel bound by an agreement that no longer served a meaningful purpose.

Book Review

The Seeker Academy

L.D. Gussin. 2007. Housatonic, MA: 4361 Press

Reviewed by **Jonathan Reams**

Introduction

L.D. Gussin's novel *The Seeker Academy* is a perceptive examination of today's New Age truth seeking movement. Gussin describes a complex and interwoven set of threads that enables his novel to do justice to the realities of such truth-seeking. The main character, Grace Hudson, takes up the journey of finding deeper meaning in life and her experience opens a window into this world. Gussin's other characters represent core types found in the New Age movement and elsewhere, and many will recognize them from their own experience. His writing style enables a movement through perspectives in a way that reveals to the reader some of his judgments while leaving space to ponder their own view of such matters.

From this brief introduction to the novel, I want to back up a step and provide some insight into why I chose to review it. Gussin asked me last winter if *Integral Review* would be interested in doing a review of his book. I did some background research, and found that he had thus far approached over 60 editors of publications in the field of progressive, spiritual or integral thought, leaders of retreat centers (places much like *The Seeker Academy* portrays) and workshop leaders of such retreat centers as well as various scholars in the field. Only one had chosen to review his book. This piqued my curiosity. Was the book so bad that people simply didn't respond? Were they simply too busy, already overloaded with long lists of books to review? Or did it touch a nerve in them that led to a tuning out of the book's message and marginalizing it through neglect?

I saw that Gussin took aim at many kinds of practices, beliefs and ideologies that I have encountered on my journey. Having formed my own views on such things, (and often finding myself in the minority), I was interested enough to say yes to doing this review. While "integral" thinking can be applied to any topic or field of inquiry, I believe that, at its best, it is able to live up to a promise to "integrate" the spiritual into our everyday experience of life rather than treat it as some kind of appendage. I hoped to see some of these insights in Gussin's novel.

The Story

The plot line is simple enough. Grace Hudson is a former actress (not profoundly successful), turned school teacher/wife/mother with, at the start of the novel, a 12 year old niece in treatment for leukemia. Through her caring support of her niece, Grace comes into direct contact with existential aspects of life. These lead her to take a summer workshop on "Embracing Sadness" at the Seeker Academy as a way of dealing with this upwelling of deeper feelings. Once there, she

SOME RIGHTS RESERVED

realized that the workshop had not answered the call she felt, and chose to stay on as staff for another three weeks.

At first, Grace finds it a strange world of people and ideas, and while making a few friends among an eclectic and diverse group of fellow staff members and workshop participants, she really is looking in from the outside. As she unwinds from the intensity of her experience with her niece and settles in to the place, she gradually becomes more interested in both the lives of those she has encountered and the ideas that form the background to their seeking. She encounters yoga, meditation, body work, past life regression and a host of other practices and beliefs. She also encounters narcissism, spiritual elitism and emotional dysfunction in the people she takes an interest in. Gussin's careful narration allows the reader to see this even when Grace may not name it as such.

The mesh of these threads is brought out in the novel through a car crash involving some of her companions. The aftermath helps bring these elements into focus and propels Grace to get at the deeper meanings behind all the action at the Seeker Academy. She weaves her way between cynicism and insight, leading her to leave the Seeker Academy with a healthy dose of distaste for some of the pretenses that are seen to dominate the presenters and their offerings. At the same time, Grace is profoundly affected by her time there.

The Review

The sparse plot line I have provided above describes the outward framework of the story, which Gussin conveys in wonderful style. There is realism to the writing, grounded in both the action of the characters and Grace's reflections on and perceptions of them. The writing uses specific events and concrete descriptive language to engage the reader with the unfolding view that gradually emerges. This style also enables Gussin to avoid awkwardly slipping in long winded philosophical discourses surrounded by some sparse action. The sections of philosophical discourse are surprisingly few and emerge naturally as support for the movement of Grace and other characters.

While Gussin does not fall prey to long philosophical meanderings, he does manage to say a lot about the wide range of ideas present in the novel. He says just enough about them, woven into the context of the characters presenting the ideas and juxtaposed with Grace's perspective to create a space where a complex, nuanced and integrated view offers itself to the reader. There are no simplistic condemnations of practices or beliefs, nor hollow praise for others.

Grace's narrative is the central thread of the book, presented in a way that enables an outside perspective on everything encountered at the Seeker Academy. Gussin uses it to reveal a complex and nuanced view of what appears to be intended as a representative segment of the New Age movement. While Grace is new to much of the content she encounters at the Seeker Academy, she is perceptive and notices that most of what goes on there enacts the same kinds of dynamics as the rest of the world, simply dressed up in new clothes. Gussin is able to show very clearly how the psychological functioning of people, some healthy and some not so healthy, gets mixed with their ideologies, beliefs and how they put those into practice. The rich characterizations Gussin portrays illuminate how much of what New Age spirituality has to offer can be and often is distorted by personal needs and agendas. At the same time he also shows that despite these and other shortcomings, this seeking can be of value, that there is truth to be found.

Attending the Seeker Academy represents turning inward and away from everyday life, captured by Grace's exploration of herself beyond being a wife/mother/teacher. This inward turn allows for reflection and the opening up of space for awareness of what has always been present to come into focus. It allows Grace to encounter a full and rich landscape that she finds mirroring the issues of her everyday world at times, or perspectives and experiences she had in the past. The tensions and distortions that arise from many at the Seeker Academy who attempt to treat it as different from the world outside its gates fuel a range of dysfunctional behaviors. Grace's perception that it is in many ways similar to the everyday world reveals Gussin's capacity to hold the richness and complexity of such seeking and the places that foster it. Eventually, this time of inward reflection allows Grace to go back out into her world with a new level of awareness that has a capacity to integrate the spiritual with the mundane.

There is also a gradual unfolding of Grace's awareness and a natural rhythm to this process that Gussin captures extremely well. I have read other novels that try to convey the subtle unfolding of consciousness, and they often feel awkward, forced or artificially contrived. This is not the case here, as Gussin manages to weave into the story the psychological and spiritual awakenings of Grace so deftly that it feels like a natural and obvious response to her inclinations and the situations she finds herself in. Her seeking arises authentically, which highlights a contrast with some of the other characters who appear driven by a range of other motivations. Some of these appear as healthy, some as unhealthy, but all of them come across as real people struggling with the complexity of their lives.

The flow of the novel felt like it rose in tempo towards a climatic realization, a collapsing to a singularity that I felt rushing in. And yet, when the end came, there was a denouement of sorts that managed to symbolize and capture everything and open up into a very real and transformed future that was also open. Grace steps back into the world at large, having found in herself a confidence and awareness that many sought at the Seeker Academy. She finds that this is not something new or strange to her, but that she has simply not focused her attention on it before.

I had a great appreciation for the way Gussin presents people first, and then the ideas as inextricably woven into the fabric of their lives. This gives the book an "integral" grounding. The diversity of the cast of characters shows the diversity of reasons people seek the truth, and the multiple ways they interpret, use and abuse the ideologies they adopt.

One element present in the novel is that Gussin calls for the return of reason to balance the some of the mysticism and more foolish elements of the Seeker Academy and New Age in general. His descriptions of some of these beliefs and practices at the Seeker Academy come across as comical at times, yet from my experience I can recognize that such things are taken very seriously by many. As with any beliefs and practices, there are people who hold those of the New Age in a balanced fashion, and others who take them to extremes and lose perspective. This is often compounded and fueled by the kinds of psychological needs mentioned above. Gussin's call for a measure of reason is fitting in this context, and the long history of tension between reason and mysticism is woven into the story as a backdrop for the seeking going on there.

It becomes clear enough through the novel that Gussin sees many people being taken in by an abandonment of reason through some psychological need aiming to be fulfilled by a belief, practice or guru. As I read through the novel, what I found myself wanting to hear more of was how one could transcend and include reason. The concept of the pre/trans fallacy is relevant here. Briefly, it proposes that what is non-rational can be either pre-rational or can transcend (and include) rationality. The fallacy is that the pre-rational can be mistakenly elevated to a transcendent status. It is common in the world that Gussin aims to describe for people to proclaim the spiritual as transcending reason, (which indeed can be true), yet actually be reverting to a pre-rational stage. To me, making and applying this distinction is a key aspect of the integral project. While I could feel hints of such a view in the novel, I wished for a more clear and explicit expression of this distinction and its implications.

Why Have Others Been Unwilling to Review It?

In reflecting back on one of the points that motivated me to read and review this novel, I can now see at least one possible reason why others had not taken up the invitation to review it. While I have indicated above a clear admiration for the way in which Gussin manages to capture the depths of real human seeking, I have only briefly mentioned how he subtly reveals his view of the leaders of New Age, spiritual or integral movements.

Gussin places these people in a very human light. The limitations of their work, the mix of personal agendas with an emphasis at times on marginalizing reason to keep critical questioning at bay are there to see. Not flagrantly, but possibly enough to get under the skin of some who might style themselves along the lines of such leaders.

Beyond this possible reason, I can only speculate on why others have not been willing to review the novel. One such speculation is that Gussin portrays many of those in the Seeker Academy as being “had by” their beliefs and ideologies rather than “having” them, and thus unable to sort the feelings arising from these views from their own psychological condition. This leads to the entwinement and enmeshment of psychological dysfunction and resultant coping agendas with a host of New Age themes. This is not very flattering for those who identify with this culture, but it is this complex situation that Gussin portrays so well in *The Seeker Academy.*

So while these reasons may have contributed to the lack of reviews Gussin’s novel has received, they stand out for me as the strengths that make it a compelling piece of literature. The mix of action and reflection narrated through Grace Hudson, the deft touch of lightly interspersed philosophical offerings, the focus on whole human beings and how they have this rich variety of mixed psychologies and beliefs all contribute to making *The Seeker Academy* a compelling and insightful read. L.D. Gussin opens up a window that clearly lets the light in, and allows us to see out onto a spacious vista, replete with helpful markers to inform us on our own journey into this territory.

Jonathan Reams, Ph.D., *is Editor-in-Chief of* Integral Review *and currently an associate professor in the Department of Education at the Norwegian University of Science and Technology, where he teaches organizational counseling, coaching and leadership.*

Book Review

Consciousness-in-Action: Toward an Integral Psychology of Liberation and Transformation.

Raul Quiñones Rosado. (2007). ile Publications, Caguas, Puerto Rico.

by **Bonnitta Roy**

Raul Rosado's new book succeeds on many levels. He makes an important contribution to integral studies; he describes new ways for understanding group and self identity; he opens new ways for transmuting the processes of fear, oppression and victim-hood into liberation and transformation; he creates a unique synthesis between the highly rational-analytic AQAL model and the native American medicine wheel; and he creates a processural system that overlays and resonates with both models. His writing style is personal and intimate. He allows the reader to feel into his own experiences of oppression, and his own journey toward liberation and transformation. But because Rosado also has worked with various communities on such issues, he is able to put the personal in context with the group—a necessary ingredient of his work.

The main feature of Rosado's process model relies on the metaphor of a cyclone. After Rosado identifies the various patterns of oppression with respect to each of the four AQAL quadrants, he shows us that these factors are not merely inter-related, but mutually inter-*active* and continually reinforcing the system of oppression. When visualized as a process, the system of oppression becomes a cyclone of oppression, "moving" inwards, causing continual contraction of self-identity. He describes two such levels of contraction: 1) the impact of cultural oppression on personal identity and 2) the psychosocial pattern of internalized inferiority. With these system models, Rosado is able to demonstrate how the processes of oppression accumulate tremendous power on the personal, cultural and institutional levels and therefore are highly resistant to change. The systems of oppression, Rosado is warning us, are *active* not static.

In the second part of his book, Rosado puts consciousness in action. Again, overlaying the wisdom of the medicine wheel with the pluralistic methodology of the AQAL model, Rosado identifies positive patterns called "spheres" of action and influence. Rosado argues, if the direction of oppression is inward, toward contraction and stasis, the direction of consciousness is outward, toward liberation and transformation. With this process framework, Rosado is able to explain the possibility of fighting "fire with fire", as it were, by activating the positive, outward momentum of conscious liberation. This momentum requires participation at the same levels that feed the cycle of oppression – and so the active response is multi-layered, multi-leveled, multi-perspectival, and integral.

Consciousness-in-Action is a useful and purposeful manual for people interested in social activism at any level. It is also a wonderful personal narrative, giving us an insight into a caring, thoughtful, and hard-working *integrated* person. Finally, it is a great example for how integral writers can expand the existing models into process versions, into infinite riches of discourse.

Extended Length Book Review and Integral Evaluation.

Integrative oncology: Principles and practice. 2006.
M. P. Mumber, MD (Ed.).
London: Taylor & Francis. 517 pages. ISBN13: 9-78-0-41537-415-6

by **Sara Nora Ross**

Nearly a year ago, a colleague associated with the editor of *Integrative Oncology* asked me to review the book, which at that time was still in the newly-published category. As a scientific reference text, it had been subjected to rigorous review procedures before its publication. Because I am not in the medical field, the motivation for asking me, as I understand it, was to have the book reviewed through an integral lens. To the usual functions of a book review would be added an evaluation on how the book meets such standards as we apply at *Integral Review*.

Not long after receiving that request, my 92 year old mother began a descent into ill health that turned out to be terminal cancer. My roles during her dying process delayed my reading and writing about this book while they provided my first direct exposure to the care and concerns of a cancer sufferer. Perhaps some insights gained and experiences pondered during that last journey with my now-deceased mother will be informed by and contribute to this later-than-promised review in some ways not otherwise possible.

> Integrative oncology (IO) is the next step in the evolution of cancer care. It addresses the limitations of the current system, while retaining its successful features. It includes the use of evidence-based tools that translate into definable outcome in the fields of preventative, supportive and antineoplastic care… IO addresses all participants in a sustainable process of cancer care, at all levels of their being and experience. Along with tools that translate into definable outcomes, it also includes methods that can transform the health of individual participants and the entire medical system. (Mumber, p. 3)

Thus begins the integrative medicine field's first reference text to focus on oncology. Integrative medicine is a term intentionally adopted by the field to replace the more prevalent "complementary and alternative medicine (CAM)." As editor Matthew Mumber explains in his introductory chapter, the aim of using the term integrative medicine is to replace dualistic distinctions between conventional medicine and CAM with more pragmatism, distinguishing "a form of medicine that delivers 'what works'" irrespective of such categories.

Organization of the Book

This book's organization indicates a commitment to educative thoroughness and consistency and therefore utility as a reference text. The first of two sections is dedicated to explicating principles of an integrative oncology. After the first chapter's introduction to integrative medicine and its general principles, six chapters offer context, principles, and resources on (a)

SOME RIGHTS RESERVED

clinical research and evidence, (b) physician training, (c) the health and wellness of the physician/health-care provider, (d) models of care, (e) legal issues, and (f) business assessment.

The second section is dedicated to practice, with an impressively methodical and highly serviceable approach to presenting material. The initial two chapters address clinical decision analysis and stages of change, respectively. The third chapter, an overview of modalities, introduces each modality and sets the presentation sequence used to organize the remaining chapters' applied subject areas. The eight modalities that are overviewed and invoked in sequence where applicable in the remaining chapters are (a) physical activity, (b) nutrition, (c) mind-body interventions, (d) botanicals, (e) manual therapy, (f) energy medicine, (g) spirituality, and (h) alternative medical systems. The authors of these overviews are also the contributors of the multiple modality discussions within the specific topics of the remaining chapters. Three of those remaining five chapters address modalities with respect to (a) cancer prevention, (b) supportive care, and (c) antineoplastic therapy. One chapter is dedicated to tobacco, alcohol, and integrative oncology. The final and longest chapter treats specific applications of integrative oncology in sub-sections dedicated to malignancies of breast, prostate, lung, colorectal, skin, and other cancers. These are followed by the final sub-section on palliative and end-of-life care.

The Chapters

Section I - Principles

1. Principles of Integrative Oncology

Before introducing the principles of integrative oncology in his opening chapter, Matthew Mumber provides a basic introduction to orient the reader. This includes an overview of integrative medicine's relationship with the conventional medicine it includes. His brief discussion of the "push" away from conventional medicine and the "pull" toward its alternatives, supported by statistics, is appropriately balanced with acknowledgment of both the positive and the negative attributes of integrative medicine. In checking, I found that the Society for Integrative Oncology (http://www.integrativeonc.org/) does not provide a definition of "integrative," but Mumber does. To do so, he draws on two general ideas from Ken Wilber: (a) since the evolution of integrative systems transpires through a combination of transcendence and inclusion, integrative oncology "must include the positive aspects of biomedicine while going beyond its limitations;" (b) a truly comprehensive integrative approach will address "all of the individuals involved—patient, family, providers, community and society—at all levels of their being (mind, body, soul and spirit) in all levels of their experience, including the self, their role in a specific culture, and the effects of and on the natural environment" (p. 6). The distraction of that assertion's grandiose scope and its odd classification of community and society as individuals are somewhat rescued by two scope-clarifying points: (a) "community" is used (in duplicative fashion, above) to refer to a group of people that includes the patient, family members, and providers; and (b) to meet the needs of these diverse individuals, a team approach to care is required.

This initial chapter of the book warrants extra space here (Table 1) to quote its list of principles of integrative medicine and then, specifically, oncology (pp. 7-8).

Table 1. Principles enumerated in *Integrative Oncology*

Integrative Medicine Principles		Integrative Oncology Principles
1. Relationship centered	7. (Continued) integrate the best therapy for individual, conventional or CAM	1. Harmlessness/beneficence
2. Cultural sensitivity		2. Service among equals
3. Individualized care based on mind, body, and spirit	8. Seeks and removes barriers to innate healing	3. Compassion
4. Patient as active partner	9. See compassion as always helpful	
5. Focus on prevention and health maintenance	10. Works collaboratively with patience and a team of providers	4. Focus on healing
6. Provider as educators and role models, i.e., self-care	11. Maintains that healing is always possible even when curing is not	
7. Evidence-based approach from multiple sources of information to	12. Agrees that the physician's job is… to cure sometimes, heal often and support always	

The defining feature asserted for integrative medicine is transformation, as distinguished from translation. The systems in which integrative medicine therapies are rooted can result in "an entirely new viewpoint" (p. 10) on the part of health providers and patients. By comparison, translational interventions target desired outcomes, i.e., a linear relationship between action *x* and outcome *y*. Mumber provides a list of differentiating characteristics of interventions with *intent* of translation versus transformation that conveys operating assumptions of the two approaches. Wordings of the transformative ones seem designed as contra-versions of the translational ones to emphasize their differences. In doing so, a number of them appear to indicate an either/or rather than integrative definition. For example, translational characteristics of "external locus of control" and "has levels of effect" have counterpart transformational characteristics of "internal locus of control" and "all or nothing." It seems that the rendering of the list slips away from the goal to integrate ("transcend and include"). However, lists are merely lists, and the "walk" of the remainder of the book does not manifest such contradictions as I inferred from this list's "talk."

Integrative oncology emphasizes the addition of prevention and supportive care in addition to treatment modalities. In doing so, it extends the Precautionary Principle. This principle had non-medical origins that have since been extended to health care situations, specifically breast cancer prevention, and its use is extended in this book. It "allow[s] physicians and other providers to act in situations where limited data are available, if that action is almost certainly safe and deemed necessary" (p. 13). The relative paucity of scientific research to date into many integrative medicine therapies places a greater burden on the practice of that medicine, because it requires high degrees of diligence to analyze the entirety of clinical situations. Overall, integrative medicine in general and oncology in particular have demanding sets of tasks to perform and coordinate, the complexities of which the remainder of the book illuminates.

2. Clinical Research and Evidence

By distinguishing an additive connotation, commonly given to *integrative,* from the more complex association of *integration*, Nancy Stark, Suzanne Hess, and Edward Shaw begin their chapter by articulating the unique demands of an integrative approach to oncology. It is not about adding to one's toolbox, the additive approach. It is integrative because it "must involve a critical appraisal of modalities that may enhance the response to biomedical therapies" or at minimum enhance the quality of life of "the community" Mumber defined earlier. It involves different systems of enhancement. These introduce perennial concerns about complementary and alternative medicine (CAM) therapies' efficacy, safety, and appropriate patient counseling. Efficacy and safety of CAM therapies are complex to assess because they must interface with chemotherapy, radiation, or surgical treatments for cancer. This level of complexity is addressed as the authors use their chapter to offer a framework for clinicians' decision making to recommend or incorporate CAM therapies in their practice. To construct that framework, they review research methods and a levels-of-evidence scheme to weigh research findings on CAM therapies, their efficacy, and their safety. These demand coordination and principled decision making.

Their discussion of research methods used in the traditional Western medicine paradigm as compared to methods appropriate for CAM therapies has a certain kind of similarity, though different and more complex, than methodological debates argued in numerous other literatures. The similarity is that of a penetrating analysis of where traditional scientific methods cannot always suffice. Rigorous science is consistently argued for in integrative medicine, so this is not an argument against it. But it is an explication of the increased complexity involved to do science that informs how to integrate CAM therapies with conventional cancer treatments. CAM therapies' *systems of enhancement* have more to juggle than cause-effect tests of single-treatment efficacy and probabilities. The authors' work in this chapter is recommended reading for researchers in any discipline as an exemplar of carefully yet succinctly teasing apart and explicating research demands, methods, well- and ill-placed assumptions, and balancing acts required with varying levels of empirical evidence.

3. Physician Training in Integrative Medicine.

Placing medical education in the principles section of the book, rather than the practice section, sends a message that Patrick Massey develops further in his chapter. He and other authors in this text refer to the high percentage of cancer patients seeking complementary and alternative medicine. One concern is that many patients do not inform their conventional medical providers about their pursuit or use of CAM therapies. With more than half of cancer patients using CAM, with or without the knowledge and advice of their physicians, physicians need a working knowledge of CAM therapies to help them communicate with and serve their patients. The contraindications of some CAM therapies in conjunction with chemotherapy and radiation should drive the need for better doctor-patient communications supported by knowledge acquisition. However, "it is safe to say that most physicians have little experience with CAM" (p. 47).

Massey discusses physician education in integrative medicine from three standpoints: the personal benefits to the doctor, progress in institutionalizing CAM in medical education, and continuing medical education. The Consortium of Academic Health Centers for Integrative Medicine, comprised of 27 medical schools at the time of this book's publication, "has become the vanguard of medical school CAM education," playing a role in addressing the first two issues above. It emphasizes the need to bring greater healthy balance to medical education, seeking to embed integrative medicine's values. The benefit is two-pronged: obviously, patients and doctors benefit from access to CAM modalities, but further, the holistic values are emphasized to increase the personal and emotional development of physicians. (Viewers of the television series *Grey's Anatomy* may have observations of how vital this two-pronged agenda is.) Massey also explores the challenges of continuing medical education in general as well as for CAM. A hopeful note is his report that according to a number of studies, the former presumption that continuing education was not necessary has been replaced and physicians recognize it as essential. Development matters: an integrative principle.

The chapter closes with a network model for community physicians, because even those physicians who choose not to use CAM therapies in practice should understand its terminology and be familiar with the research as well as where to find experts in CAM to serve as resources. Methods to start new continuing medical education programs are enumerated, as are resources that include physician retreats and healing spas, among others.

4. The Health of the Healer: Physician/Health Care Provider Wellness

Developing the rationale introduced above, Danna Park's focus in this chapter is on how and why providers' health statuses matter, too. Medical texts rarely address the conflict between self care and care for others inherent in the medical profession. Easier said than done, Park discusses the challenges of physicians' incorporating self-care and wellness. One source is less evident than others: the integrative approach recognizes the interconnection of provider-patient relationships, each person affecting the other. Well developed, an integrative approach may result in "the practitioner-patient relationship itself becom[ing] a tool for healing" (p. 58).

The wellness of oncologists is particularly vital when studies report from 25-50% of them suffering from burn-out, and high percentages of physicians without personal health-care providers. Oncologists suffering from high emotional exhaustion and the sense of low personal accomplishment were about half of one study. Park explores several domains of burn-out and its detrimental impacts on patient care, stress, depression, suicide, drug and alcohol abuse, and relationships. The role of "medical culture," instilled during the inhumane rigors of medical school, stands out as a significant player in embedding ongoing challenges to wellness. Part of the challenge to wellness is the need to transform our systems from "sickcare" to health care. Principles promoted by an increasing number of groups "are a call to action" to "start with introspection and honest self-evaluation, honoring the fact that the individual is at the heart of change" (p. 67). The remainder of the chapter is dedicated to addressing a wide range of approaches that educate about and support delving into personal self-care, from individual lifestyle changes, to the psychosocial or interpersonal, to the spiritual. The message to physicians it that it is possible and vital to develop more integrative awarenesses, and to realize the extent to which their health impacts patients, families, and the medical system as much as their ill-health does: the principle of beneficence begins with oneself.

5. Models of Care

Judith Boyce's chapter is instructional for integrative medicine practitioners who want to extend the reach and benefits of integrative approaches. In addition to treatment modalities, this can include the preventative and supportive dimensions of the integrative triad. After enumerating and discussing practical discernment, logistical, and strategic questions necessary to the launch of a new practice, and in particular one using integrative medicine therapies, the remainder of the chapter is dedicated to presenting models of care with their advantages and limitations followed by examples of 14 integrative medicine centers.

The chapter also could be instructional for the integrative oncology field as such. In it, I see the beginnings of a (presumably) new model. Such a model could perhaps lead to an evidenced-based developmental assessment tool for the field's own use. In effect, Boyce's overall presentation enables, at minimum, four kinds of high-level gazes. These are relevant to factors involved in evolving cancer care. Each gaze can discern a spectrum of sorts across the factor(s) it examines. One kind of high-level gaze enabled is at the structural form of organization(s) involved in a given model. Another is at the level of geographic, including within-building, location. A third is the spectrum of increasingly complex and more integrative models and the factors that enable them to be so (but not enumerated here). Finally, one is the spectrum of population demographics reached and *relationships formed and affected*, as a function of the organizational structure, location, and degree of integrative level achieved. Given a vision of integrative oncology addressing "all participants in a sustainable process of cancer care, at all levels of their being and experience," such a model to under gird various assessments may be a developmental tool for the field.

6. Legal Issues

All physicians, and many other health providers, have to be concerned with the legal and ethical demands that go hand in hand with their medical profession. When medical collaborations include CAM therapies, issues of shared liability surface along with malpractice and other traditional areas of law that apply to non-CAM practice. Michael Cohen and David Rosenthal use cases from their own experience and liability and ethical frameworks to analyze situations that integrative oncologists may expect to arise in practice. This treatment presumes the United States context; legal issues in other countries would differ somewhat. The clinical audience they target in this chapter includes oncologists who have cases of (a) patient seeks therapeutic advice about CAM therapies, (b) patient enrolled in a clinical trial designed to use a CAM therapy, or (c) a patient who plans to use CAM therapies with or without medical advice.

CAM therapies are sufficiently in the medical mainstream that the National Center for Complementary and Alternative Medicine (NCCAM) at the National Institutes of Health has defined integrative medicine and recognized its therapeutic modalities when they have merit determinable by "some high-quality" evidence. While these are the beginnings of institutionalizing integrative medicine, Cohen and Rosenthal point out that because NCCAM does not specify a threshold for that evidence, it leaves the clinician "to make delicate judgments at the borderland of good clinical and legal sense" (p. 102). More thoroughly institutionalizing integrative medicine would show up in the form of more, and more specific, guidelines for this context.

In the meantime, the legal and ethical maze of factors for clinicians to weigh in making decisions is elaborate. By offering case scenarios and discussing their intricacies, case law, general malpractice theory, and permutations of the cases, the authors walk through the kinds of legal and ethical reasoning and hypothetical tangents that they, institutional review boards, consulting attorneys, and courts of law must navigate. The intricacies—applicable in research and clinical practice—are increased when patients exercise their options to disregard physicians' advice while the law may maintain that physicians remain responsible. The chapter includes two practice-relevant appendices with procedural forms, and a list of major resources for legal and ethical issues in integrative care.

7. Business Assessment

Joan Kines begins her chapter with the question: Why provide integrative oncology service? One of the answers is the prediction of an expert in the field that infers consumers in the United States context, at least, will continue to demand CAM therapies. The prediction is that by 2010, the supply of alternative practitioners would grow by 88%, as compared to the supply of traditional medical physicians growing by 16%. Kines situates her question, though, in the context of an integrative oncology business assessment. Before launching such a service, there are numerous practical business issues to address. She tailors her contribution to walk her target audience through the detailed assessments required to function in the U.S. context. Addressing both general and CAM-specific concerns, it treats market and costs assessments, reimbursement analysis, medical codes and how to add new ones to categorize CAM treatments, CAM reimbursements and non-reimbursements by the medical system, insurance benefits covered, and insurance coverage issues related to specific modalities. The appendix supplies schedules of specific insurance coverage and physical therapy policy.

Section II - Practice

A stated purpose of this major portion of the book is to move forward the process of defining the practice of integrative oncology. For its target audience of physicians who serve as the "conductors" of the integrative approach, the attempt is to build a decision making guideline. In chapters and sections dedicated to specific clinical goals, the multiple interventions are presented together in a framework so that an integrative approach rather than a toolbox approach may be more accessible and likely to be adopted.

8. Clinical Decision Analysis

Judging from his review of the several efforts previously undertaken by others, Matthew Mumber's chapter substantively addresses the previous void in integrative oncology's decision analysis. His systematized approach results in a standardized method that is transportable to the different contexts in which clinical decision making processes must coordinate (a) a patient's clinical situation, (b) specific treatment goals, (c) general preventative approach, (d) general supportive care approach, (d) general antineoplastic approach, and (e) the level of evidence for therapy.

He developed four decision tree processes rooted in case experience, corresponding to four major groups of decisions. These address the variations of patient and disease characteristics: localized versus metastatic disease and high versus low rates of disease control or response. Within each group's decision tree is a separate decision pathway for the intervention goals of prevention, supportive care, and antineoplastic care. This results in each decision group actually having four decision process trees within it, encompassing an integrative approach to the group.

While the term decision tree may invoke in the reader a line drawing of bifurcation-type decision points and the limbs and branches that lead to and from them, Mumber's decision trees reflect a juxtapositional, nuanced approach—and no line drawings. He appears to correct for deficiencies in earlier approaches to integrative oncology decision making. This befits the complexity of coordinating the multiple relations among decision factors. While each decision tree is tailored to the specific challenges, nuances, and if-thens of the four groups above, they share a consistent centerpiece, which I call Mumber's *juxtapositional matrix*. It provides a systematic method for using the preponderance of data for safety and efficacy to arrive at recommendations. Each of the twelve decision tree processes is supported by clinical examples of scenarios in which the process would be used. Mumber stresses that these products are "by definition, exploratory tools—and are not meant to be firm clinical guidelines" (p. 147).

My specialization in complex decision making processes suggests the following assessment of Mumber's integrative contribution. Given the inherent complexities of cancer in human systems, the variations in patient and disease characteristics, the balancing acts of deciding how to coordinate conventional and CAM therapies, the uneven range of reliable data to inform decisions, the different levels of evidence provided by those data, and the integration of treatment, prevention, and support goals, Mumber is contributing a significant innovation that should support integrative oncologists' efforts to coordinate the challenging array of *systems of relations* their profession demands. This is no small feat, all in the service of these physician-conductors of multi-system orchestras of patient-family-provider communities they in turn serve.

9. Stages of Change

Robert Lutz introduces his brief chapter on stages of change by acknowledging some of the various perspectives that cancer patients in different disease or high risk contexts may manifest. This sets the stage for introducing the stages of change model already familiar in the medical field. Relative to an individual's readiness to initiate a new behavior, the stages are: (a) pre-contemplation (preceding awareness of a problem requiring change), (b) contemplation, (c) preparation, (d) action, and (e) maintenance. The change process is recognized to be a nonlinear one, characterized by different rates of passage through the spiral of the stages. Lutz provides an integrative range of patient change-readiness assessment points: (a) quality-of-life concerns, goals, and expectations; (b) current health status/fitness status; (c) health practices and attitudes; and (d) life situation and environment. Wisely, he recommends periodic re-evaluation that acknowledges barriers and challenges, a step-wise approach that includes articulating how the program is affecting the individual's perceived quality of life. This feedback loop can support the change process. He suggests that physicians who have developed healthy lifestyles, and implicitly, who have navigated their own change processes, may be more effective providers.

10. Modalities - Overview

Over the span of more than 70 pages, this overview section is organized to provide a systematic introduction of the eight modalities that may be included in integrative oncology.

Each modality section has the following sub-sections: (a) general introduction, (b) cancer research background, (c) major current questions facing that field, (d) general summary that includes tools for practice, and (d) glossary of terms specific to the modality.

10a. Physical activity, by Robert Lutz. Lifestyle behaviors influence the occurrence of diseases. Rather than viewing cancer and other diseases as "actual" causes of death, the locus of cause is more and more recognized as lifestyles and behaviors therein. Research to date does not explain the exact biological linkages between physical activity and cancer, but supports that such a link exists. Levels of physical activity that support prevent and treatment will vary by one's age and life conditions.

10b. Nutrition, by Cynthia Thomason and Mara Vitolins. The development of 30-50% of all cancers is linked to dietary patterns and food selections. As with physical activity, the exact connection mechanism with the development of chronic disease, including cancer, is yet to be made. Estimates are that 30-40% of cancers could be prevented by maintaining healthy body weight, nutritious food intake, and increased physical activity. Nutritional care for oncology patients that responds to nutrient metabolism changes is a well recognized need.

10c. Mind-body interventions, by Linda Carlson and Shauna Shapiro. A mind-body intervention is "any treatment that addresses the interaction between the mind (thoughts, feelings) and body (physical processes)" (p. 184). Some such therapies are already mainstream in oncology, while a number of others are viewed as adjunctive. Therapies covered throughout the book include hypnosis, imagery, relaxation, meditation, yoga, psychotherapy and creative therapies (e.g., dance, music, writing/journaling, painting/drawing, sculpting). Other interventions are not included in the book due to both space constraints and more limited research. These include biofeedback, healing prayer, and autogenic training. Mind-body interventions help decrease symptoms of depression and increase emotional expression, and many have potential impact on the immune and endocrine systems. Psychotherapy and meditation have the most research and thus the strongest evidence to date. Cancer patients' needs change over the course of time and the variety of interventions used can be tailored accordingly.

10d. Botanicals, by Lise Alschuler. Among cancer patients, from 13-63% are estimated to use publicly-accessible herbal remedies, yet relatively few health-care professionals are trained to recommend such botanical therapies. Research data on botanicals and cancer care are mostly experimental, yet demonstrate promising results and trends. Clinicians have insufficient data for decisions to include or recommend botanicals. Institutionalized support for regulation of quality, standardized ingredients, claims of efficacy, and drug interactions related to botanicals is a societal growing edge.

10e. M*anual therapy,* by J. Michael Menke. Hands-on therapies reduce anxiety, pain, disability, and related inflammation by restoring structural and mechanical function. The manual therapies of massage, chiropractic and osteopathic manipulation treat from the "outside-in" via the muscular-skeletal system. Although there is a compelling link between inflammation and cancer, there is no evidence that manual therapies are effective as antineoplastic goals. Modern manual therapies offer risk assessment, preventive, early detection, supportive, and rehabilitative contributions in an integrative oncology.

10f. Energy medicine, by Suzanne Clewell. Energy medicine includes “all energetic and informational interactions resulting from self-regulation or brought about through other energy linkages to mind and body” (p. 203). This includes energy pulses from the environment that affect both biology and psychology, such as magnetic, electric, electromagnetic (radio and micro waves, including cell phones), acoustic, and gravitational fields. Evidence documents that humans can generate and control subtle energies that seem to influence physiological and physical mechanisms, although these are not yet measurable. Thirty-four energy medicine modalities are organized in table format to indicate their non-mutually-exclusive distribution across their modes of use. With the percentages calculated from the table by this reviewer, modes of use Clewell itemizes are energy that is: (a) guided by universe (59%), (b) guided by practitioner (70%), (c) administered by others (97%), (d) self-administered (65%), (e) distance healing (17%), (f) current research (73%), and (g) used in U.S. hospitals (47%).

This section is longer than those that precede it, justified by the nature of its invisible topic. Ten characteristics of energy medicine are listed, providing an inferable snapshot of subtle energies’ characteristics: for example, energy follows thought, energy medicine is non-local, and changes in the energy field are eventually expressed in the physical body. Clewell walks the reader through the human chakra energy system and selected therapies, providing an orientation to this non-Newtonian universe. The review of the chakra system offers an integrative window into the meta-system of the human person. It represents an opportunity to understand active interrelations among the systems of one’s psychology (e.g., emotions, thoughts, motivations), of one’s chakra energies, and of one’s numerous physical sub-systems. Integrative, indeed.

10g. Spirituality, by Howard Silverman and Toby Schneider. This longest of the eight modality introductory sections begins with attempts to define spirituality; at the same time it respectfully avoids imposing a definition that could be argued and thus distract from the purpose of introducing the modality. Beyond the earliest pages, the section progresses further into meaning-making territory, suggesting the difficulty to tease apart “things spiritual” from “things psychological.” One author’s autobiographical journaling during her cancer experience is used liberally for inspiration and to illuminate points. Two brief mnemonic-based tools for soliciting patient history, “spirituality assessments” developed by others, are shared to aid clinicians’ efforts to be present to and explore this dimension of patients’ beliefs.

10h. Alternative medical systems, by Lawrence Berk. The general philosophy of ancient medicine systems is congruent with that of integrative oncology. This section discusses how these systems work and how they address cancer in general, selecting three of them for specific introduction. While these medicine systems are complete systems, most recommendations in the remainder of the text include only partial aspects of them. Beck compares Western medicine methods and assumptions with those of alternative medicine systems. These differences are evident in the brief descriptions of the three selected for focus: ayurvedic medicine, homeopathy, and Traditional Chinese Medicine. Supportive care of cancer patients has effective tools in alternative systems of medicine. These systems, however, view cancer as a late-coming symptom of pre-existing, underlying problems of a systemic nature. (In this, their relation to energy medicine is most evident.) In these systems, many such problems are not viewed as treatable by the time malignancies become evident. Thus, these systems stress prevention.

11. Modalities – Cancer Prevention

Cancer prevention takes place on three levels. *Primary* is the level of prevention in the general population. *Secondary* prevention concerns people with documented precancerous changes. *Tertiary* prevention is that with people who had a cancer diagnosis and good results from treatment, and want to prevent recurrence of the disease *or* its symptoms. (This echoes the energy and alternative medicines above: disease is the last, not initial, manifestation of problems.) The remainder of the chapter is in sub-sections of detailed discussion by the various modalities' content experts of their modalities' effects on the three levels of prevention.

12. Modalities – Supportive Care

Supportive care is not an option for oncologists. Rather, it is an integral dimension of the continuum along which they have responsibilities, from diagnosis through the course of illness. Supportive care is needed in managing both the cancer and treatment-related symptoms. Possible symptoms are numerous: sleep changes, pain, depression, anxiety, weight gains and losses, and changes in connections with sexuality, fatigue, mucositis, nausea, and diarrhea. The remainder of the chapter is in sub-sections of detailed discussion by the various modalities' content experts of their modalities' contributions to supportive care. Of these, the energy medicine sub-section is both the longest and most impressive for the wide range of integrative dimensions it addresses, an indication of the pervasively holistic nature of energy medicine and its insights.

13. Modalities – Antineoplastic Therapy

Antimeoplastic therapy refers to all interventions whose action mechanism results in eradicating, i.e., killing, cancer cells from the body. The three major categories are conventional medicine's chemotherapy, radiation therapy, and surgery. There are several active trials of new antineoplastic alternative approaches. The remainder of the brief chapter is in sub-sections of detailed discussion by those content experts whose modalities do, or may, contribute to antineoplastic therapy.

14. Tobacco, Alcohol and Integrative Oncology

Because it includes yet transcends the smaller scale of the individual patient and extends to greater social scales, Dennett Gordon's may be one of the most socially-integrative chapters in the book. From its introductory citations of health and demographic statistics and relationships of tobacco and alcohol consumption with cancers, its discussion moves from individual-oriented treatments to systemic consideration of the institutionalized health tragedy that plays out around the world. It advocates for social, political, and institutional approaches and reframing national and international agendas, and proposes a list of interventions believed to be effective at the societal level.

15. Specific Malignancies

Six sections of this chapter are individually dedicated to prevalent cancers: breast, prostate, lung, colorectal, skin, and a group of "others." Consistent with the scheme used throughout the book, each modality that can be included in an integrative oncology for each specific malignancy is discussed in that context. Each section includes a substantive reference charting of benefits of interventions in the specific malignancy. Charts specify relevant modalities and interventions, their benefit, and the level(s) of evidence available for each line-item. These sections complete the reference function of the book, discussing the current state of knowledge on treating the conditions and the findings of relevant studies. The final section is described separately, next.

15g. Palliative and end-of-life care, by Matthew Mumber.. Palliative care, as described by the Institute of Medicine, "seeks to prevent, relieve or sooth the symptoms of disease or disorder without effecting a cure… is not restricted to those who are dying or those enrolled in hospice programs… attends closely to the emotional, spiritual and practical needs and goals of patients and those close to them" (Mumber, p. 495). Mumber notes that palliative treatment is closer to an integrative approach than conventional medicine, given the fact that at this stage, curing is impossible while healing remains possible. CAM modalities are also being considered as part of palliative and end-of-life care. About 60% of hospices use CAM and patient studies indicate more satisfaction with hospices when they do. Patient preferences for palliative care are not yet widely incorporated, though. For example, although 90% would prefer to die in the comfort of their home, only 15% do. The key elements of palliative care are concerned with alleviating suffering in the physical, emotional, social, and spiritual dimensions. Each of these has at least several manifestations. This final section of the book itemizes alternative modalities that provide palliative care of these various sufferings at the end-of-life.

Evaluative Discussion

In the earlier Section I – Principles part of this review, I incorporated some evaluative comments into my overviews of those chapters. Occasional evaluative comments showed up my review of the Section II – Practice chapters. Thus, my remaining discussion is organized to respond to several global evaluative questions I asked and sought answers to while reading this text. The first is drawn from the book's own stance about what integrative oncology does and how well the book's contents appear to manifest or support that stance. The other three questions are the evaluation points *Integral Review* (IR) employs to assess how well a given work meets IR's criteria.

Integrative Oncology's Stance

Two related assertions at the beginning of the book convey what I would call the overall stance of integrative oncology. Because the field is yet young, stance would include commitments, hopes, and aims to be realized in the future.

> Integrative oncology (IO) is the next step in the evolution of cancer care. It addresses the limitations of the current system, while retaining its successful features. It includes the use of evidence-based tools that translate into definable outcomes in the fields of preventative, supportive and antineoplastic care… IO addresses all participants in a sustainable process of cancer care, at all levels of their being and experience. Along with tools that translate into definable outcomes, it also includes methods that can transform the health of individual participants and the entire medical system. (p. 3)

> A truly comprehensive integrative approach will address "all of the individuals involved—patient, family, providers, community and society—at all levels of their being (mind, body, soul and spirit) in all levels of their experience, including the self, their role in a specific culture, and the effects of and on the natural environment (p. 6).

The global evaluation question was how well the book's contents appear to manifest or support that stance in relation to its key elements. I found that before I could legitimately use the foregoing assertions to select key elements for evaluation, I needed to make some editorial revisions to them. Working from a re-worded stance removes the need to critique unrealistic elements in the original wording. I considered unrealistic those elements that lacked sufficient qualification of scope, or that were outside the realm of the practical or possible if they were interpreted literally. Segments that I have revised are indicated by italics and some original words are deleted.

> Editorially revised versions of integrative oncology's stance.
>
> Integrative oncology (IO) is the next step in the evolution of cancer care. It addresses the limitations of the current system, while retaining its successful features. It includes the use of evidence-based tools that translate into definable outcomes in the fields of preventative, supportive and antineoplastic care… IO addresses all participants in a sustainable process of cancer care, *to the extent possible,* at all *relevant and accessible* levels of their being and experience. Along with tools that translate into definable outcomes, it also includes methods that can transform the health of individual participants and the entire *U.S.* medical system. (Editing included insertions only, no deletions.)

How Well Does *Integrative Oncology* Manifest and Support the Field's Stance?

Integrative oncology: Principles and practice is an extremely well conceptualized and systematically organized scientific reference text that I would learn from and take seriously, were I a member of the medical field. It is a research-based, non-speculative resource. It explains and addresses a range of limitations of the current cancer care and medical systems with a positive, constructive tone, and offers evidence-based reasons for recommended changes in medical education. It advocates for reframing the yet prevalent competition between conventional and integrative approaches. It embeds methods to help achieve pragmatic, non-competitive integrations of "what works" in cancer care. It incorporates the best of current medical practices and tailors them to the unique challenges of this specific field, e.g., defining and including levels of evidence criteria in treatment decision making and in detailed outlines of complementary and alternative medicine approaches. The book consistently incorporates attention to the three dimensions of cancer care: preventive, supportive, and antineoplastic. Its innovation of standard guideline decision trees offers a new model for clinical decision making in oncology and embeds the integrative approach in those processes. Methods are clearly oriented to foster healthy transformations in patients and physicians/health providers, including various forms of patients' healing as compared to curing. The book succeeds in manifesting the stance of the field in these respects.

The book's effectiveness is uneven when it comes to manifesting the stance of the field to address "all participants" and "all levels." Explicit statements about addressing all participants at all levels appears in only a few places in the entire book. When it is encountered, it includes no explication or rationale. Implied, however, is a "should:" that integrative approaches "should" essentially be all things to all people. This is a tall order for any enterprise, and one that warrants careful, realistic modification. For example, Figure 1.1, page 7, includes more "participants" than any single field can "address" at "all" levels, e.g., society, culture, and the natural world.

To avoid overstatements, an integral approach would carefully discriminate among the viable possibilities and reasons for them, identify and compare possibilities and constraints, and articulate principles that are more tailored to contexts and are thus more pragmatic than sweeping generalizations. Integral approaches are practical. They take into account others' perspectives as well as various forces of inertia and motivations, etc. They can embrace the reality that no enterprise controls the attitudes, behaviors, and choices of others, who may not wish to be affected by the enterprise's mission in the same way as the enterprise envisions, if at all.

However, Chapter 5 in Section I on models of care provides, even if more implicit than explicit, the windows into various *hows* that integrative oncology may use to fashion itself into realizing its worthy goals. Whether taken at its face value as an integrative examination of integrative medicine models, or as the beginnings of a complex integral model that supports developing the field itself, it is noteworthy for offering grounded pointers to help the field manifest its stance. While its section in this review did not include any specific mention of how the models do or do not address the community of the patient defined at the beginning of the book, that chapter is the place in the book where that stance gets some attention (but see below).

While the book does an excellent job of addressing perhaps most of the patient's and physician's needs, concerns, behaviors, healing, and education, it gives little attention—beyond initial mention of them—to "the team" of health providers serving a patient (p. 6), or to "the community," "the group of people that includes the patient, their family members, and the providers" (Fig. 1.1, p. 7). One reason may be that in a non-speculative, evidence-based book for a young field, there is insufficient data to do more than identify the ideal. But I also reflected on the possibility that the objectives for the book could not encompass so much as to address these two key elements. I reflected on the possibility that focusing on patient, physicians, and the challenges of cancer itself leaves little room, in practice, to address individuals who are peripheral or at least not consistently central to attention. I reflected on the steep demands on the "conductor of the orchestra" (p. 6), whether the traditional or integrative oncologist working with the patient, to coordinate the team of providers. This set of reflections led to the notion that what is missing in each of those scenarios is the role of *process observer*. Process observers do not have such tasks as direct patient care, team coordination, operational communications, etc. The role is to maintain a finger on the pulse, the awareness and oversight of the processes going on, and alerting team and community members, as appropriate, to circumstances and occasions that need their attention. A process observer might also function as an important link between the medicine delivery team and the patient's community of family and other support. If in the development of this text there had been a process observer role, might the team and the community around the patient have been given more print space? In general, might an integrative oncology with goals to address all participants benefit from incorporating a process observer role?

The whole domain of patient, family, and other caregiver dynamics and relationships, part of "the community" mentioned above, was untouched territory in this book. While conventional medicine procedures may adequately address issues in this domain and their effects on patients, it may be possible that complementary and alternative medicine treatments could engender additional dynamics. Does an integrative oncology elsewhere address these and their impacts on patients, treatments chosen, related stresses, and relationships? If not, does it need to?

Appropriate sections of the book addressed larger social and environmental effects on patients and the occurrence of cancer. These were not exhaustive, but their scope seems justified. Economic and health insurance coverage issues were touched on in various sections of the book, but the overall economic picture represented by complementary and alternative medicine (CAM) was not portrayed or addressed. In stating that, I reflect the assumption, which I believe applies, that CAM is largely an option for the shrinking middle class and the wealthier upper class population in the U.S. Long term, deeply systemic change would be required before this picture is likely to change in the U.S. much less elsewhere. This is certainly an aspect of "all participants, all levels." Does integrative oncology have this picture in view and a long term strategy toward greater access to CAM therapies?

The nutrition modality presented throughout the book conveys its significance in health and cancer rates. Of all the modalities, it and physical activity are universal across populations. Nutrition represents certain issues not addressed in the text. Integrative factors that might have been introduced include those of: (a) educating the general population about the nutrition-disease linkage and (i) correct balances of food amounts and varieties and (ii) how to select and prepare nutritious meals; (b) institutionalizing such education, including the society-borne costs of both that education and nutritional ill-health from lack of it; (c) economic difficulties of purchasing the variety of quality foods in the ideal diet, and their compounding when multiple dietary needs co-exist in one family budget; (d) meal preparation time and effort in both busy working families and cancer patients' life conditions; and (e) pervasive influences of advertising and other media on unhealthy food choices.

Individuals' culture and culture at large received only cursory mention in a few places. Beyond the mention of medical culture's roots in medical education, and participants' "role in a specific culture," (p. 6), cultural sensitivity (p. 7), stigma (p. 212), and taboos (p. 223), I did not see the text incorporate cultural considerations. Different cultures characterize medical teams, patient communities, the medical system, ethnic groups, and larger society. From a realistic standpoint, though, it makes sense for the text to confine itself to refer to culture without delving into it. This would be because *how* culture could be a factor and be addressed would require case and culture specificity, not the purview of this general reference text.

In summary, the book *Integrative Oncology: Principles and Practice* succeeds in manifesting and supporting the stance of the integrative oncology field as represented at the beginning of the book, without contradictions, and with only a few minor weaknesses that do not detract from its success or its benefits to readers.

Integral Review's General Evaluation Criteria

The following evaluation, brief in light of the foregoing review and evaluative process, applies *Integral Review's* general criteria to the book, *Integrative Oncology*.

Criterion #1

> *The work reflects or takes into consideration multiple possible perspectives of understanding how humans perceive, organize, and experience reality. Along with this, it demonstrates some understanding of the evolutionary processes, layers, and patterns inherent in all life phenomena.*

Criterion #1 is for assessing if the work coordinates multiple systems of various kinds (which are described quite generically in the criterion). To *coordinate* systems means one may reflect on, create, compare, contrast, transform, define and/or synthesize their properties and behaviors. This is the hallmark of integral thought and action.

The field of integrative oncology is explicitly about coordinating the existing medical system with integrative medicine systems applied to cancer care. Within integrative oncology, the evidence-based systems of preventative, supportive, and antineoplastic care are integrated. The book's organization itself reflected coherent coordination of the numerous systems not only of that cancer care triad, but also the modalities available within them, and further, those modalities applied to cancers in the human system. Numerous perspective systems and social systems at various scales were coordinated in multiple places throughout the text. Authors demonstrated the coordination of multiple kinds of systems within their presentations. These accomplishments may be inferable if not always explicit in the book review's abstracts of and evaluative comments on the chapters. *Integrative Oncology* meets Criterion #1.

Criterion #2

> *The work demonstrates a sensibility for developmental and/or evolutionary dimensions throughout the lifespan of individuals, social units, organizations, and societies.*

As the first reference text of the integrative oncology field—a social unit—the book represents the field's determination to be the next step in the evolution of cancer care. The book advocates for evolutionary complexity showing up in the form of the integration of, rather than competition and dismissive attitudes between, integrative medicine and conventional medicine.

While doing so, it advocates for more research to support its own evolution as an evidence-based field, which in turn will facilitate its integration with conventional medicine. It is explicitly sensitive to the conditions supporting the development of cancer, individual and societal development to reduce those conditions, and the patient's and physician's own development as sufferer and healer, respectively.

In these and other ways not spelled out here, *Integrative Oncology* meets Criterion #2 in basic ways that are necessary but not necessarily sufficient for a more fully integrated, and integral, developmental approach. Beyond the scope of the present text, the ideal would require an additional text to full apply this criterion. To do this would involve applying developmental theory itself to integrative oncology principles and practices. This would reveal that principles and practices, in practice, thwart any *one size fits all* assumptions. A fully developmental treatment would require nuances and tailoring to address the variety of differences in individual and organizational behaviors at each stage of development. This is a recommended direction for integrative oncology, integrative medicine, many other institutions and, actually, society as a whole.

Criterion #3

> *The work is oriented toward facilitating translative as well as transformative development in various domains of life. (Translative development refers to increasing capacity within a given set of competencies, views or attitudes. Transformative development refers to the evolution of a set of competencies, views or attitudes with a fundamentally greater capacity for handling complex situations.)*

The purpose of the book, well supported by its presentation, is transformative. The contents effectively articulate how both translative and transformative development in individuals, medical education and practice, and other domains can be fostered and manifest in multiple ways. *Integrative Oncology* meets Criterion #3.

Conclusion

Little did I imagine that this book review cum evaluation processes would result in a writing of this length. It was a long but satisfying exercise, and one that I hope serves the field of integrative oncology.

In closing, I want to return to having mentioned at the beginning of this writing that I had gained experience and insights from having companioned my mother in her dying process. The most poignant to share became more so during this process of reading and writing. It has much to do, I believe, with integrative oncology's vision for evolving cancer care and transforming the health of individuals and indeed the larger medical system.

To relate one experience, below, helps me underscore the importance of key insights in *Integrative Oncology's* chapters on energy medicine and alternative medical systems. Their authors emphasize that cancer and many other illnesses—our human *dis-eases*—are symptoms and end results of various problems of imbalance (dis-ease) that long precede the physical forms they will eventually take if they go unaddressed. This is familiar territory for those who do various kinds of energy practice or medicine, but it is not mainstream knowledge yet. If it were, and if it were coordinated in integral ways described above, and if it were applied in practice in our individual and collective behaviors, it could have the revolutionary and evolutionary power to indeed prevent dis-ease and transform the health of individuals and societies.

Three years before her death, my mother left her geographic community of 45 years to move to another, to my nurse-sister's home. A few weeks before dying with cancer and related complications, she shared her personal diagnosis. "You know, I think I began going downhill this summer, when I was starting to feel so depressed with missing all my old friends at the Senior Citizens Center (in her former community) and not finding any Centers here I could get to. I think that's when all this started."

If a culture is imbued with recognition of the wide array of catalysts of dis-ease, and of dis-ease as a forerunner of disease, it would under gird and motivate a society that invests in the numerous kinds of services and *education in healthy ways of relating* that help prevent and alleviate dis-ease. Integrative medicine has the insights to be the vanguard of such a culture.

Sara Ross, Ph.D., *holds an interdisciplinary doctorate in Psychology and Political Development. As a researcher, theorist, and practitioner, she specializes in investigating and applying knowledge of universal patterns to analyze and address real-world problems in their detailed and developmental complexity. She is the founder and president of ARINA (www.global-arina.org), which is the 501(c)(3) organizational home of* The Integral Process for Working on Complex Issues, *and publisher of* Integral Review: A Transdisciplinary and Transcultural Journal for New Thought, Research, and Praxis. *Email: sara.ross@global-arina.org*.

Editorial

With this issue of *Integral Review* I launch a new practice of inviting contributions from the associate editors for these editorials. There are numerous reasons making this an appropriate time for such a change: the behind the scenes work of this group has enabled IR to grow as it has, we are spreading work around more than before, and each of them has contributed significantly to my own learning. In particular I would like to acknowledge the significant and tireless work of Assistant Editor Sara Ross in this regard. Not only has she contributed writing to our pages, she has also provided thoughtful reviews as well as invaluable networking to help us grow. This is not to mention the rigorous proof reading and copyediting she contributes to each issue in addition to taking care of the website itself. Yet it is not for these reasons that I invite Sara to take on the voice of writing this issue's editorial—it is because of the depth of thought, the ability to perceive and highlight complex and subtle interactions between articles, enabling you as the reader to engage this issue with an overview that does far more than merely introduce. So read on, and I will leave you in Sara's capable hands.

Co-defining, Reflexive Recursions

Sometimes it is only quite close to a publication date that we know exactly which manuscripts will be ready for inclusion in a given issue of *Integral Review*. While it is always a source of satisfaction to me when there is a subtle weave of coherence through subjects that serendipitously end up in an issue's table of contents, it is even more delightful when a vigorous theme shows up at the very end that we could never know in advance would develop. Such is the case this time with Volume 4, Issue 2.

The name I coined for the theme I saw emerging here is *co-defining, reflexive recursions.* A recursion is an operation, an active performance. For example, in software, a code can "call itself" to re-perform its function over and over. If the software has a bug, the repetitions might be a mistake, an endless loop going nowhere. If the software is behaving, the repetitions keep functioning on new data, new relationships, and thus create new connections that could be made only by performing the recursions. For my purposes here, then, a recursion is an act of information processing, creating new insights, new theories—and as we shall see, even new evidence—by having *called itself to "do itself" again from a different place in the process.* The development of integral theories, interventions, and ways of being is characterized by recursions of many kinds, both within and among individuals and social groupings, and so it is germane to *IR's* publishing mission to shine a spotlight on them.

Recursions are nonlinear dynamics to experience, to *perform.* Not static, they require performance, else they do not exist. We can enter into recursions done by others in their writing,

SOME RIGHTS RESERVED

and we can also "do" recursions ourselves in the course of reflecting on others' work (not to mention in the very living of our lives). This issue of *IR* affords opportunities for both kinds of recursions. Yet, because we cannot expect titles to communicate what we will find in the works themselves, editorials can offer signposts. In this case, I want to indicate the two kinds of recursions and some *co-defining* and *reflexive* properties or potentials that attend them. In introducing the authors' contributions comprising this issue, I highlight which contributors embed and invite a recursive agenda, as some do so more explicitly than others. These are opportunities to benefit from following along with and digesting the fruits of someone else's recursions. Yet there are also implicit opportunities, both within and across other works published here, and I want to point some of them out, as well.

Daniel Anderson's extended-length article, *Such a Body We Must Create: New Theses on Integral Micropolitics,* is a product of his developmental recursions on his previous work. His eight theses are qualitatively different from those we have been perhaps conditioned to expect when someone presents a theory. On its face, the list of eight implies a linear progression. Yet each thesis is a *system of understanding,* interdependent and co-defining or co-causal with the others. Both author and reader need to visit or revisit other theses in order to dive deeply into any of them: recursive visits when one thesis is "called from" its place in different theses. Thus does Anderson perform a recursive integration of meaningful systems in building theory to transform praxis. He wants to support the development of an "immanent and immediate, local, even under the skin" postmetaphysical integral praxis. He builds his theory critically yet with modest claims and a spirit of inquiry, inviting readers to "practice integral" transformations this way with robust results "more precise, more rigorous, more elegant, more effective" for theory, interventions, and radical living.

Invested in the necessity of strong theory-building in the social sciences, serendipitously Steven Wallis' *Validation of Theory: Exploring and Reframing Popper's Worlds* explains and demonstrates how such theories and methods can pass tests of robustness, if not hard-science style validation, when certain recursions are designed into them. Popper's demanding criteria for validating a theory, Wallis explains, can apply well enough to hard science but miss key assumptions when it comes to social science. Wallis re-frames Popper to offer an alternative theory-validation model, where "the idea of a theory constructed of co-defining propositions provides a robust alternative to axiomatic terms." Ah, is *that* why Anderson braids and folds theses over and around instead of laying straight track? In a sample application of his model, Wallis shows how the method's use of recursions on different "scales" of data, co-defining propositions, reflexivity of a theorist, and further reflexivity of the analyst assessing the theory manage to produce and integrate disparate sources of empirical data: such recursions generate evidence. Wallis, too, is modest in his claims and realistic about limitations at this stage of his theory development. One who wishes to evaluate Anderson's or any other social science theory for robustness could deploy Wallis's model and thereby evaluate its robustness too.

IR's tradition of a Russ Volckmann interview feature introduces us to the wide-ranging life and interests of *David Loye on Integral Evolution*. From many fascinating dimensions of Loye's long productive life, I highlight the recursion he and Russ invite us to make, in effect, by revisiting Darwin. Going to the scientist's primary source material, Loye discovered Darwin to be a quite integral theorist! What might happen if we revisit Darwinian evolution theory from the different starting point offered by Loye? Hmm. Could Wallis' model be used to test the robustness of this much-contested theory (and opposing arguments) too? Loye infers that if Darwin himself rather than mutations of his theory had gained more traction, then the modern day institutionalized adoption of the mutation, "survival of the fittest," might not be so disturbingly evident; for example, in the following article.

Carol Hoare's analysis of *The Toxic Effect on Children of a Degraded U.S. Society, Family, and Educational Context: How Will This Nation Respond?* shows the spiraling, recursive effects of interrelated social system dysfunctions and their complex but obvious roles in degrading conditions for child education and learning. Rather than blame the schools, they should be seen for what the data indicate: schools "are but a microcosm of society, and that they alone cannot rectify educational deficits."

Harking back to Loye, then Hoare: How often might we trace our social deficits to the narratives that under gird them? What is it like, the process of constructing new narratives, new meaning making? In Sayyed Mohsen Fatemi's *In Search of Narratives* and *A Tour to the Flea Market of Signification,* stories of recursive "trips to the well" experiences offer clues for reflexion. A clue Andrew Campbell recognized when discerning the images he contributed to this issue: *The Resurrection …Paradisio.*

This issue's reviewers of an article and two books keep the theme going while offering insightful reviews of substantive works. In *Advanced Change Theory Revisited: An Article Critique,* Scott Pochron notes the value of ACT's stepped model of adult development for more reflexive leaders, that in recursive terms I use here, to realize *how* difficult moments are opportunities for leadership to *call itself to "do itself."* Nathan Harter's philosophical astuteness challenges us to perform recursions on our assumptions about moral and ethical behavior as he reviews the book *Leadership Ethics: An Introduction.* There are no easy answers for constructing some moral narratives. Jan Inglis, a regular *IR* contributor, continues her examinations of climate change challenges from an integral perspective, reviewing a book that she recognizes as also employing an integral perspective, *The Bridge at the Edge of the World: Capitalism, the Environment, and Crossing from Crisis to Sustainability.* With its publication just barely predating the recent economic meltdown, she invites the book's author—and perhaps us, as well—to perform a recursion on his analyses from the new place created by the meltdown.

My own co-defining, reflexive recursions within domains of my life have been immensely enriched while working with each of these contributions to *IR.* Getting hooked into my own thematic, I see recursions, recursions, everywhere. And I hope some of these editorial offerings might enrich readers' appreciation for the work of this fine group of authors and artists. Enjoy!

"Such a Body We Must Create:"
New Theses on Integral Micropolitics

Daniel Gustav Anderson

Abstract: This essay proposes a rigorously postmetaphysical integral praxis, defines what this means and how such an intervention may be premised, and demonstrates throughout some methodological and practical advantages this approach may have over extant metaphysically-oriented integral theories. Beginning with an interpretation of post-Hegelian historical and dialectical materialisms informed by the Buddhist dialectical tradition of Madhyamika, a series of coordinated and interrelated theses address problems proper to fields such as phenomenology, hermeneutics, semiotics, historiography, and subaltern studies. The claimed purpose of this project is to coordinate subjective (psychological, spiritual) and objective (social, political, economic) transformational imperatives into a coherent, non-ontological "counterproject." It takes as its aim the production of a radically democratized, responsible, and sane subjective and objective space, where responsibility is characterized as critical clarity, competence, creative consciousness, and compassion.

Keywords: Buddhism, causality, consciousness, counterproject, Deleuze, dialectics, ecocriticism, integral praxis, Krishnamurti, Marx, Nagarjuna, nonduality, postmetaphysical, radical democracy, responsibility, semiotics, Spiral Dynamics, subjectivity, transformation, Wilber

> *Can one divide human reality, as indeed human reality seems to be genuinely divided, into clearly different cultures, histories, traditions, societies, even races, and survive the consequences humanely?*[2]

Introduction: How to use this Text

In the present inquiry I propose two related interventions, one into integral theory and culture, and another implementing the theoretical positions I take into praxis in the world at large, with the theory intended to make transformative praxis possible, and the conditions of praxis intended to make the theory useful and responsible for building a life worth living for all. I argue eight separate theses (listed below), which either follow from each other logically, or recontextualize extant integral models into the framework I construct, or both. Holding all eight together is the conviction that humanity is confronting an apparently fragmented but in reality integrated set of problems, many of them violent—social, ecological, economic, legal, political, subjective—that are best addressed by an integrated set of solutions, such that transformation of the holy, horrible mess we inhabit into a sane, nonviolent, and democratic order becomes possible. This is, obviously, a utopian ambition.

I mean something very specific by *integral theory*. Broadly speaking, the *integral* part of integral theory seeks to address the problem of *everything* (Wilber, 2000b),[3] and to propose means of transforming it: first to grasp this puzzling, preposterous world for what it is, with our confused and problematic selves, in order to then help solve the problem, thus giving two interventions. I begin with the observation that the psyche, the socius, and the cosmos, as we conventionally experience them, are problematic, even pathological, but I also hypothesize that these things are not necessarily what they may seem to be to us, and thus that the problem need not be so problematic (or necessarily so to *this* degree).

Theory is *systematic* applied conceptual work, a method one uses to accomplish practical, tactical matters. The purpose of any theory, inclusive of integral theory, is to *make* and *coordinate the use* of effective tools (concepts) for addressing actual problems.[4] As those of us who may have worked with our hands know, effective tools are made with a specific kind of precision—a helpful tool is crafted, even repurposed, in response to the contours and textures of the problem addressed in the given job site and the systematic design strategy of the architects.

---

[1] Smith (1997, p. 11)

[2] Said (1978, p. 45)

[3] As a cultural matter, integral theory is in this sense one heir of a project initiated by early-modern pedagogues such as Pierre de la Ramee (Petrus Ramus, 1515-1572) and Jan Amos Komensky (Comenius, 1592-1670)—that of organizing many discrete problems into a schematic, spatial *theory of everything*. Ong (2004) offers a now-classic analysis of this project.

[4] This claim is informed by Deleuze & Guattari (1994), where philosophy is defined as the practice of making concepts.

Here, concepts are precise tools used in the day-to-day labor of a theoretical *project.*[5] I repurpose several of them—totality, articulation, coherence, flicker, novelty, surprise—in an analogous way in this essay. This work is intended as an essay in the etymological sense of an attempt, a test, a trial, and an inquiry. It is not a treatise, nor a manifesto, nor a loyalty oath, nor a "life starter kit." For this reason, I invite the reader to consider taking up further points of inquiry as suggested by any one line of thinking presented here. The problem at hand, the integral problem, demands this kind of conceptual precision,[6] actually a greater and more scientifically rigorous precision than I personally am capable of. As such, these are *new* values, new to integral theory. New values are necessarily exotic, in that they present themselves as they are relative to their new context—unfamiliar, perhaps unwelcome, perhaps uncomfortable or uncomforting. To adopt a Nietzschean trope, they are unfit for easy consumption. The usefully new is like this. At first it is puzzling and exotic, beyond the reader's horizon,[7] but through a respectful approach and repeated exposure it becomes familiar and useful in the way a handtool does when one has mastered its use. A handtool is impersonal. It does not care about its user's hopes or fears; mercilessly, it carries on with its task of hammering or cutting, regardless. Theory generally and new values specifically are like this also: philosophizing with a hammer,[8] cutting through spiritual materialism (Trungpa, 1987), making the Body without Organs with a "very fine file" (Deleuze & Guattari, 1987, p. 160), as appropriate.[9] Unlike theology, theory is not a consolation (see Thesis Seven).

Uncompromisingly novel interventions have been challenging in just this way, historically. Consider the riot that greeted the debut of Igor Stravinsky's prophetic-voiced *Rite of Spring*, most meaningful in the context of all ballet that had come before it, or the difficulty James Joyce's *Ulysses* must have presented to a reader accustomed to the much less demanding narratives of Walter Scott or Charles Dickens.[10] This is not to imply that my work is analogous in significance to Stravinsky's or Joyce's, or that the oeuvre of any integral theorist (Aurobindo, Gebser, Krishnamurti, Wilber) is analogous in importance to that produced by Dickens, Scott, or Tchaikovsky. Rather, *Ulysses* and *The Rite of Spring* are examples of how the novel appears first as an *unacceptable* or impenetrable surprise, but then over time transforms its milieu—again, a double intervention. The present inquiry aspires to such a transformation in integral practice (see Thesis Eight). I humbly ask my readers' indulgence with the stiffly-worded passages, on the promise that, insofar as I have been successful, the effort one invests in parsing a given thesis ought to be rewarded in kind with conceptual, and therefore practical and transformational, clarity. I have also suggested ways in which these theses relate to and recontextualize each other parenthetically, giving some texture and space for the reader to work with imaginatively. The structural and stylistic features of this text are intentional and purposive. As a practical matter, I invite newcomers to explore this essay in order to become acquainted with it, at least for a first exposure. Because major points and many minor motifs are cross-referenced to other relevant material in the essay, one can follow threads and skip around at a self-directed pace, as desired. In fairness to the work, however, if one intends to really understand any one part of this proposal, one will need to work through *all* of it systematically, because it expresses a systematic strategy. This is an *integral* theory, after all. One must be responsible for the totality (see Thesis Two).

---

[5] To more fully elaborate this analogy: if concepts are analogous to tools, then method and theory are analogous *not* to an ad hoc collection of tools or a "toolbox" but to a total design strategy, inclusive of architectural concepts, structural engineering, materials science, project management, finance, and strategic planning.

[6] Weber (1978) presents this simply as a pragmatic problem: "The most precise formulation cannot always be reconciled with a form which can readily be popularized" (p. 3).

[7] This is a core problem addressed in philosophical hermeneutics as a scene of potential transformation. Gadamer (2004) summarizes it as follows:

> The horizon is the range of vision that includes everything that can be seen from a particular vantage point. Applying this to the thinking mind, we speak of narrowness of horizon, of the possible expansion of horizon, of the opening up of new horizons, and so forth. (p. 302)

[8] This refers specifically to Nietzsche's late literary and rhetorical practices as in *The Twilight of the Idols*, not simply smashing things indiscriminately for the reactionary thrill of indiscriminately smashing the values of others.

[9] I find non-metaphysical and non-theological conceptual tools more appropriate to the integral task than metaphysical and theological ones. This should not be confused with an *anti*-theological position. By analogy, a surgeon's justifiable workaday preference for a scalpel rather than a hatchet ought not to be confused with a blindness to the virtues of hatchets or animosity toward them or a crusade against them.

[10] These examples, while concise and convenient, imply an unfortunate kind of high-art heroic-genius romanticism that is foreign to this project. In reality, art is produced by networks of people, including novel interventions in the field of culture such as Stravinsky's and Joyce's. Becker (1978) analyzes this in detail.

Three recent interventions in integral theory make an opening for the present work. First, my (incomplete) attempt to flesh out the political ambivalence of certain core integral positions and to frame a program for a critical integral theory[11] on post-Marxist grounds (Anderson, 2006); second, Bonnitta Roy's (2006) reintroduction into integral discourse of a model of time, space, and the production of subjectivity that is much more amenable to empirical, material analysis than the Providential view favored by Wilber (following Aurobindo) and a subject of critique in my own work,[12] in that Roy reads things in the world first as processes rather than as statics or as inevitabilities; and Gary Hampson's (2007) endorsement of the dialectic as a postformal operation and reconsideration of the postmodern in an integral context. Taken together, one finds *dialectical materialism,*[13] the postmetaphysical (and in my presentation of it *nonontological*) method of Marxist and post-Marxist praxis,[14] and the primary theoretical framework of the present inquiry, which I attempt to pursue to its logical conclusion.[15]

---

[11] This "doubled" explication of critical social theory into the cuts-both-ways of a Buddhist dialectic (emptiness of subject and object, co-causality) has been suggested before in many contexts. For example, Hakamaya Noriaki has proposed that authentic Buddhism, to be distinguished in his view from most actual Buddhist practice, is nothing more nor less than criticism of this type. Specifically, Hakamaya identifies the practice of Buddhist dialectics, not only as a historically significant intervention into traditional Indian idealism analogous to that of critical philosophy into European theology, but functionally equivalent to European dialectics, to critical method (Hubbard & Swanson, 1997, p. 58). The specific topic Hakamaya singles out for critique in Japanese Buddhist culture are broadly similar to those I have targeted in the work of certain canonical integralists, including "the realist affirmation of the topical as the self-evident original ground" and the contemporary reconstruction and reestablishment of "indigenous" (read: Orientalist) "modes of thought" (Hubbard & Swanson, 1997, pp. 63-66), both of which I take to be rather obvious ideological gestures. To this extent at least, the present inquiry is sympathetic to Hakamaya's project. Finally, Ken Wilber has long incorporated the diction of Buddhist dialectics into his project, but in a way I find problematic (see Thesis Five).

[12] Hegel (1902) asserts that Providence "manifests" in time in the variable form of historical manifestations (p. 14), where historical manifestations include human consciousness developing according to an *a priori* plan. Aurobindo Ghose (1949) employs this definition as well: "a pre-determined evolution from inconscience to superconscience, the development of arising order of beings with a culminating transition from the life of the Ignorance to a life in the Knowledge" (p. 742). And also like Hegel, Aurobindo characterizes this evolution as Providential, and worded very carefully in the passive voice to allow a measure of plausible deniability. "Even in the Inconscient there seems to be at least an urge of inherent necessity producing the evolution of forms and in the forms a developing

The trajectory of my argument is as follows:

Thesis One: Any "thing" as such is a coherent product in time of multiple causalities and co-causalities: a double articulation and a work-in-progress, a *coherence*.

Thesis Two: This co-causal articulation is a totality. Due to specific causes, totalities may be stratified and therefore characterized by internal or external conflict. This conflict is also co-conditional.

Thesis Three: The coherence arises, persists, and decomposes in time; it can change in time mechanically, consciously by accumulating developments to a stable regime, or consciously by transforming said regime. Transformation may be necessary to produce responsible results. Theory can help (if responsible) or hinder (if not) any transformation.

Thesis Four: Responsible intervention can produce real transformation in the totality. The first intervention is to recognize the nature of a given situation; the second is to maintain relationship with it over time. Responsibility is characterized by critical clarity, competence, consciousness, and compassion.

Consciousness," Aurobindo (1949) posits, "and it may well be held that this urge is the evolutionary will of a secret Conscious Being and its push of progressive manifestation the evidence of an innate intention" (p. 742). Aurobindo's engagement with Hindu traditions notwithstanding, his presentation of evolution has its intellectual roots in the Providential theology of Hegel.

[13] Dialectical materialism is, properly speaking, a way to apprehend the material and social world, while historical materialism is a nineteenth-century method for understanding history and political economy. In this essay I use the term "dialectical materialism" in a less rigorous way than is conventional, and subsume into it the methodological function of historical materialism. To be very precise about it, however, I would insist on calling this method dialectical *immaterialism* (Anderson, 2006).

[14] I would like to emphasize that this is an experiment in Marxist historical method, rather than an affirmation of Marx's or any one Marxist's findings. For instance, Marx's badly-informed Victorian-era prophecies on the future development of capitalism, demonstrably false today, are recognized as such and rejected.

[15] Exposing both the subject and the object to the kind of analysis I propose in these Theses One, Two, Five and Six effectively leads the Marxist dialectic to the same end as the Madhyamika of Nagarjuna, also a dialectical tradition: dependent origination or co-causality (Sanskrit: pratityasamutpada), whose core text is most accessibly translated by Stephen Bachelor (2000). My interpretation in this regard has been strongly influenced by Hookham (1991) and Trungpa (1987), as well as my own earnest and active if negligible practice of Mahayana Buddhism. This recontextualization of the social to the subjective (form into emptiness) is the obverse of the projects Jones (1989) and Hattam (2004) have proposed, where Buddhist dialectics are redeployed into a coherent social theory (emptiness into form). The points of contact between Marxism and Madhyamika I tentatively touch on here need much development in future integral scholarship.

Thesis Five: Where duality (form) is an aggregate of co-conditioned products-in-process, nonduality (emptiness) is immanent, unconditioned. Recognizing and remembering this are the subjective valences of the first and second interventions, respectively.

Thesis Six: Coherences are best understood when read responsibly, each in their own specificity and with reference to their own histories (as form), not exclusively or absolutely by any developmental or classificatory scheme of values (which are also coherences with histories).

Thesis Seven: New values may be made, emergent cultural forms do arise, but "New Ages" do not "emerge" mechanically or Providentially. New regimes, like new values, are responsibly made.

Thesis Eight: The current regime produces unacceptable results. If a "New Age" is to be made, transformative practice must be radically democratized, and resist commodification.

Insofar as this is a rigorously *nonontological* project, it is a *postmetaphysical*[16] project, indigenous to the tradition of American pragmatism as much as a post-Heideggerian suspicion toward any metaphysics of presence. By nonontological I mean that nothing, not any one thing, is posited as ultimately real or unreal, or the product of a reality or an unreality, only as temporary, contingent, provisional, and unsatisfying. While I do propose a theory that addresses problems traditionally appropriate to metaphysics in all eight theses, my intention in presenting them in the way I do is to avoid participating in the reactionary movement against critical practice Jurgen Habermas (1994) diagnoses as a problematic "*renewal of metaphysics*" (p. 28).[17] Instead, I offer what I hope may become a useful contribution to what Richard Rorty (2006) has described as a *postmetaphysical culture*[18] in which common ground is sought and found in the field of appropriate values and responsible cooperative action rather than in mutual adherence to an ideology or an ontology (see Thesis Seven).

---

[16] This proposal moves from different premises than the curiously metaphysical "postmetaphysical" view posited in Wilber (2006) and related commodities and promotional materials marketed by Wilber's Integral Institute.

[17] In his well-circulated comments on the matter, Habermas (1994) observes that this kind of thinking manifests, Ramus-like, on the "subcultural" fringes, and produces thoughts that

> oscillate amidst a surreal corona of *closed worldviews* that are put together by shabby speculation from bits of scientific theory. Ironically, New Age movements fill the need for the lost One and Whole by abstractly invoking the authority of a scientific system that is becoming ever more opaque. (p. 28-29)

That Habermas abuts this renewal of metaphysics against a seemingly authoritative if Baroque system of thinking, predicated on (in his view) pseudo-scientific speculation, with some relationship to New Age or human-potential culture and a concern for unities and wholes, and with some profile by the early 1990s, all suggests he is referring to a specific but unnamed philosophical project that bears all these characteristics. Guessing which one (if one exists beyond the obscure German titles he references) is beyond the scope of the present inquiry.

[18] Expressing a position developed in Rorty (1989), Rorty (2006) defines such a "poeticized" culture as

> one in which the imperative that is common to religion and metaphysics—to find an ahistorical, transcultural matrix for one's thinking, something into which everything can fit, independent of one's time and place—has dried up and blown away. It would be a culture in which people thought of human beings as creating their own life-world, rather than as being responsible to God or 'the nature of reality,' which tells them what kind it is. (p. 46)

The present inquiry aspires to this challenge.

Finally, I am mindful that some of the analysis I offer here may seem unacceptable to many in the integral community, particularly those invested in positions I take to task for being in my view inappropriate to the transformative project. Spiral Dynamics, in its original iteration (Beck & Cowan, 1996), is most directly critiqued. This may be due to my own acknowledged limitations as a thinker, to the real problems I claim to have found in the theory, both, or neither. Regardless, I welcome good-faith criticism and the occasional differences in approach that arise when theoretical problems are worked out in a public forum. I do not pretend to have the final answers or an absolutely comprehensive view, nor do I insist on a contrived consensus in matters social, conceptual, or contemplative; this is not a "master map" analogous to Prof. Hazelton's[19] in Wilber's novel *Boomeritis* (Wilber 2003),[20] nor is it intended to become one, although I have attempted to account for ideologies (conservative, liberal, theological) that I find incomplete or provisional, and to work in an interdisciplinary way to the limits of my ability. Nor do I propose the reduction of all integral inquiry to the monotonous epic voice of one map, as Hazelton does, whether Aurobindo's or Gebser's[21] or Wilber's or mine. Instead, I submit that one task of integral theory is to align common interests without eliding meaningful differences such that diverse and dispersed transformational projects can work in a coordinated fashion as a *counterproject*[22] to those forces and flows that produce social and psychological fragmentation, disharmony, and violence—in short, to make the dialogic space *meaningful, sustainable democracy* possible.

Thesis One

> *Any "thing" as such is a coherent product in time of multiple causalities and co-causalities: a double articulation and a work in process, a* coherence.

---

[19] When asked if she or her colleagues at IC promote the teachings of a particular school, Hazelton replies in the negative. "'The idea,'" she replies, "'is to take all of the known maps of the human mind—East, West, ancient, modern—and create a master map, a comprehensive map of the human mind, using all of them to fill in the gaps in any of them'" (Wilber, 2003, p. 115). Hazelton does not seem to be aware that the master map she is constructing, "this integral map," *is a school*, specifically the school she is creating by deciding what is "best" in any given cultural tradition or mind-model, and therefore a unique discursive position.

[20] *Boomeritis* is a rather unique text. There is almost no trace of irony in it—unusual for a novel. Following Bakhtin (1981), one might argue it has more in common with epic than novel, given its monologlot voice.

[21] In this essay I classify Gebser as a Hegelian, but it should be understood that Gebser is not precisely a Hegelian in the Providential way Aurobindo seems to be. Gebser does posit a spiritualized (but atemporal) origin, metaphysically real, that manifests through human practice in a near-future new reality, which is taken to proven the reality of said origin. Thus, Gebser assumes the origin he seeks to prove, a tendency Marx diagnoses in Hegelian thinking in the *1844 Manuscripts* and Althusser explicates (see Thesis Two)—even in the face of Gebser's own strong words against Hegel (Gebser, 2004, pp. 41-42).

[22] Schweickart (2003) elaborates this concept in full.

A *coherence* is something that is coherent *as* something recognizable as itself,[23] complete or whole in itself (see Thesis Two), that may include some or all of its own interpretation (see Theses Three and Six). It is a thing one can identify conventionally—the pen in my hand I can and do recognize as a coherent pen in a coherent hand, rather than as a meaningless or unfamiliar shape, or as a mass of matter indistinct from the mass of matter I call my hand or the one I call the page.

The coherence is also an articulation, a causally-produced moment, an aspect of a process or more properly a set of synchronous processes,[24] the product and production of a curiously double fold of multiple causal forces. Stuart Hall (1996) notes first that "these things," the features of an articulation, "require to be linked because, though connected, they are not the same" (p. 38)—we have to read coherence *into* a set of phenomena, as Merleau-Ponty (2003) discusses in his example of a spot of color against a field of a contrasting color (p. 5); perception makes coherence out of it.[25] I may not know which atoms belong to this pen and which belong to my hand, but my eye knows from past experience where the hand stops and the pen starts.[26] Double articulation: experience, memory (subjectivity), and a present situation (objectivity). To anticipate my argument a bit, this act of perception and making-coherent is typically holographic in nature (see Thesis Three). Hall (1996) gives some characteristics of a coherence.

> The unity which they form is thus not that of an identity, where one structure perfectly recapitulates or reproduces or even 'expresses' another; or where each is reducible to the other; or where each is defined by the same determinations or has exactly the same conditions of existence; or where each develops according to the effectivity of the same conditions of existence; or even where each develops according to the effectivity of the same contradiction […]. The unity formed by this combination or articulation is always, necessarily, a 'complex structure,' a structure in which things are related, as much through their differences as through their similarities. This requires that the mechanisms which connect dissimilar features must be shown—since *no 'necessary correspondence' or expressive homology can be assumed as given*. It also means—since the combination is a structure (an articulated combination) and not a random association—that there will be structured relations between its parts, i.e., relations of dominance and subordination." (Hall, 1996, p. 38, emphasis added)

---

[23] Wilber (2000a) uses the word "coherence" to characterize the "holon;" Ziporyn's (2004) use of "coherence" as an analytical category for aspects of a given getstalt expresses the "holon" in a more elegant and fruitful way, without implying the kinds of hierarchic structures or ontological views Wilber posits that I do not, so I adopt it here.

[24] Lukacs's (1971) repeated insistence that all apparent things are actually but moments in and of processes is in my view a necessary conclusion of dialectical thought.

[25] For Merleau-Ponty (2003), this is problematic in a way that anticipates my discussion of stupidity in Thesis Four: "We make perception out of things perceived. And since perceived things themselves are obviously accessible only through perception, we end by understanding neither" (p. 5).

[26] This aspect of the mechanical, even arbitrary *overdetermination* (see Thesis Two) of form relative to the smooth space of nonduality or, in practical terms, undifferentiated matter, is indebted to the very detailed analysis presented in Deleuze (1995).

Thus, the articulation is a way to think of any coherence as a Gramscian "historical bloc," a coherent moment of form induced by a complex and contradictory[27] matrix of causalities,[28] real ones—on one side race, gender, class, geographic conditions, cultural values, pathologies, and strata of development, and on another side, the perception (mass-perception) of others that makes such an articulation coherent *as* something.[29] Is this shape in my hand a tool, or is it a threat? A parasite, a friend? Part of me or foreign to me?

This is co-causality or dependent origination, analogous though not identical to the same concept in traditional Buddhist dialectics. A concrete example: when I walk down the street, a casual observer of conventional capacity may first notice my light skin, my masculinity, my age, my build, the slight limp with which I move, the line of beads around my left wrist, the cat dander on my sweater—any or none of these—and will immediately, without volition, see the moving form of my person not as a random, ramshackle set of odd parts and bad luck, or a projection of shape into nonduality, of nonduality (see Thesis Five), but will connect these points into a constellation and construct them into a recognizable assemblage such as a man, a white man, a middle-aged white man, likely of working-class origin (if I foolishly open my mouth to speak or show my hands), and perhaps a cult member—not a Wilberian philosopher-sage, not a wizard of the dynamic spiral, not a steppin' razor, not a street fighting man.[30] *This is automatic*[31]

---

[27] For example, Hampson (2007) observes that Wilber is dyspeptically dismissive of multiculturalism (p. 163), a cultural moment that makes real integral inquiry possible in the first place—as a properly contextualized, respectful, and intelligent appreciation of world values and traditions (see Thesis Seven), akin to respect for human dignity (and appropriately, it is the third commitment made by the California Institute of Integral Studies in its mission statement). Aurobindo Ghose's remarkable capacity to hold *Paradise Lost* and the *Mahabharata* in his mind at once is nothing other than a multicultural gesture, an integral gesture; but this contradiction in Wilber's work, between monoculture and multiculture, is but one example of a contradiction in an articulation (the articulation "Wilber's work," numbered as it is in consecutive waves). I would like to suggest that as coherences spiral into increasing complexity, the odds increase that contradictions, inner tensions, will arise, and that these tensions can be wedged open productively by critique into *new* coherences.

[28] Following David Hume, relations of cause and effect are to be understood here as interpretations or plausible assumptions. For instance: I recognize the cup of coffee in my hand to have the characteristic of warmth. I can posit a causal history of this characteristic through the on-off binaries of the electric power grid in my hometown, through the buzzing transmission of electrical current across the Columbia Plateau to the spinning turbines of the Bonneville Dam, made to spin by the kinetic energy of the flow of the Columbia River, which is drawn to the ocean from the mountains by the force of gravity and other forces. All these are taken as *plausible interpretations*, nothing more, for the purposes of this analysis—inclusive of causalities that one may experience as ironclad necessity (necessity being another plausible interpretation for a phenomenon).

[29] In conventional metaphysics after Aristotle, so-called categories of understanding (adapted in different ways by Kant and Durkheim among many others) exist already and serve to make coherent to a subject what an object's nature is. For instance, space, as a category, allows one to delimit a thing by its position in space relative to other positions (left or right, up or down, larger or smaller); time, as a category, allows one to delimit a coherence by its duration. By contrast to this approach, I do not posit the metaphysical reality of any category, only the causal loops that produce consensus, inclusive of the consensus of coherence.

[30] This analysis emphasizes the formation of objects of sight and surveillance, but can also be extrapolated on principle to accounts of the other four senses as well as objects of the mind (ideas), and the emotions (mood, affect, perception). In fact, objects of the senses tend to coincide: as I watch my pen move across

(see Thesis Four); these autonomisms are the "mind-forg'd manacles" William Blake raged and despaired at in early capitalist theo-imperial London. I may or may not be conscious of the meaning I am making in concert with others as I perform my life, or in control of that meaning (it is more likely I am controlled by it), but if pressed I cannot deny this shared meaning.[32]

Anderson-out-for-a-walk and under surveillance by the local so-and-so is precisely an articulation in this double sense, dependent on the causes that produced the assemblage I identify with as my own set of problems and promises, as well as the perceptive capacity of said so-and-so, which is also a production of a similar set of forces, an articulation itself.[33] In this sense, a coherence (the pen in my hand, Anderson-on-walkabout) actually is *co-created* dialectically, in something of a double articulation between conditioned consciousness (subject) and the conditions of objective *conditions* (in the language of nonduality: the observer is of the observed, subject and object are both are temporary formal knots of the same space). This correspondence, as Hall observes, is not necessary as such, nor necessarily holographic. I argue that it is *conventionally* such, but I would also like to emphasize that it is *not necessary* to view Anderson-out-for-a-walk as an anonymous working-class white guy, or the neighborhood eccentric, or whatever at all—reduced to its components the contingent aggregate Anderson-on-walkabout is nothing at all, nothing remains, not even a "real" nothing or void—and this is so for any articulation (see Thesis Five). It is not necessary to take these things—any *things*, any *coherences* anything "self-evident"—for granted.

This "not necessarily" makes intervention and transformation possible, from the top or the bottom of the molar structure (the "superholon" in Wilber's diction). The charismatic gesture, of which Krishnamurti's project may be an example *par excellance* (see Thesis Eight), works so comprehensively because it ruptures both ends of the articulation, subject and object. It abandons the (personal) past; it cannot be *read*, which renders any *consensus* past irrelevant to the transformative moment. Not nonexistent, but transformed in (or out of) significance. This is a form of exposure to the new in the always-familiar, which is precisely the uncanny position of nonduality relative to every coherent formation (see Thesis Five).

---

the page and I hear the scratching of the paper and feel some friction in the fingers of my right hand, I unconsciously triangulate all three into one coherence, the hand-pen-paper assemblage. That is, objects of the eye, the ear, and touch become one object, my pen doing its work.

[31] Hartigan (2005) gives a detailed analysis of the psychology and sociology of race in the United States, specifically with regard to whiteness and its strata of articulation. My treatment of the phenomenology and semiotics of race in this example is indebted both to Hartigan's analysis and my own experiences as "white trash" in America.

[32] Weber (1978) approaches this concept of the co-constitution of phenomena in his definition of social action. He posits that a causal explanation of social action is possible, that action can only be regarded as such "insofar as the acting individual attaches a subjective meaning to his behavior—be it overt or covert, omission or acquiescence," and that such action is "'social' insofar as its subjective meaning takes account of the behavior of others and is thereby oriented in its course" (p. 4). In short, Weber posits social action as a causal loop: genres of social behavior make action coherent to subjects; subjects behave meaningfully when they act generically, thus reifying and reproducing those genres. This insight informs Theses One and Eight.

[33] One can test this with a simple thought experiment: replace any of the terms I used to identify my appearance to the world (race, gender, age, or class), and consider how one's subjective response to this character of Anderson-on-walkabout may change as these terms change.

This presentation of any coherence as an articulation of sociohistorical forces[34] may lead to the misunderstanding that I am promoting a version of what Wilber (2000a) diagnoses as "sociocentrism" (p. 243), the mistake of reductively reading all gestalts through the values of the given context in which one has arisen. However, I am not proposing any kind of "centrism," but instead promoting two safeguards against this species of what Mill (1998) called *the tyranny of the majority*. The first is an insistence on dialectical and material analysis, which demonstrates all values to be contingent on specific contextual forces for their arising and maintenance, their characteristic mutability over time, and their typical relationship to the will-to-power of any dominant stratum. Approached in a different vocabulary, Foucault (1971) famously demonstrates that no conventional set of values is necessarily the sanest approach to formal reality, or even a necessarily sane approach at all. Although not a category for analysis or a dialectical position, nonduality is the second safeguard against sociocentrism, because it reveals first that all social forms—all forms without exception—are in and of a space that has no center or circumference, that by the logic of nonduality "centrism" is a fallacy, in the last analysis untenable. Seeing how one is placed in a given discursive, subjective, everyday-life position (*Eureka*!), one is able then to work toward an active recontextualization of one's subjectivity, which amounts to a total revolution of all existing values for the sake of all beings without exception when pushed to its necessary conclusion, a commitment I call becoming-responsible (see Theses Four, Six, and Eight).

The purpose of reading any given coherence as an articulation of multiple causalities, a historical bloc, is first to observe directly how the (apparently) absolute, naturalized values of that moment are in fact contingent on nothing absolute at all, but only the push and pull of manifold, provisional, and temporary contradictions and make-believe[35] absolutisms that produce fragmented everyday consciousness. This is what I call the *first intervention*, which corresponds to the miracle of the "observer" and the "observed" mutually recognizing one another as being of the same stuff, which begins a novel dialectical movement between conditions and consciousness—qualitatively different from a mechanical, automatic process. The *second intervention* is to constantly, rigorously produce new values through postformal critique, through the "gay science" of creative praxis. That is the transformative, conscious valence of the double articulation (see Thesis Five), which, in concert with unconscious or mechanical dependent originations, produces the totality of all *formal* and *postformal* moments in this world.

So far I have examined only how individual coherent subjects relate to individual coherent objects, cooperatively conditioning each other by force of inertial—mechanical energy—or volitional consciousness, or a point on a spectrum between these two poles (mechanical and volitional). In Anderson (2007) I consider some ways in which will-to-power and desire flow through masses of subjects and draw some conclusions on the political use to which these flows can be put, either for conservative or transformational purposes, and how values are made.[36] All this begs the question of how subjects live and are made coherent in relation to groups of other subjects, and in relation to larger coherences such as the state,[37] corporate bodies, institutions, military hierarchies, and affiliations of religious sentiment or cultural appreciation, all of which are also coherences[38] (taken up in Thesis Two).

---

[34] That a cognate position to my own can be found in Wilber's work and in Spiral Dynamics—that "value systems, worldviews, and mindsets" are "each the product of its times and conditions" (Beck & Cowan, 1996, p. 29)—suggests that this view should have some purchase among even the most conservative of integral thinkers.

[35] By *make-believe* I intend to express both the conventional meaning, imaginative play appropriate to children, and also any means by which people are made to believe demonstrably false narratives—in the family, in the workplace, in civil society. Children are introduced to this second process also, early and often, in North America; for instance, many households encourage the belief that an obese Coca-Cola spokesmodel with a herd of flying ruminants delivers Christmas toys that were manufactured by cherubic elves, rather than by living people.

Further, two significant consequences follow from my position on co-causality. First, it follows that a being or reality having characteristics such as permanence and immutability can never be *proven* satisfactorily, only assumed or asserted Miltonically. Second, values, because they are contingent objects (not a permanent, immutable body of Law, as in Kafka), can only be projected onto *other* objects by subjects (flowing through *masses* of intertwined subject-object formations). For instance, the sound “nay” means “no” in English but “yes” in Korean. This demonstrates that neither negation nor affirmation as evaluative functions inhere ultimately in the sound “nay,” but only as one set of consensus values in Seoul, and another in London (or both in many North American cities, where both languages are spoken). Neither being nor values are necessary or quantifiable, but can be experienced, understood, and evaluated qualitatively.[39] It hurts when I stub my toe, even when I know my body and its pain to be unreal in any metaphysical sense, and unfailingly impermanent.

Subjects reproduce these consensus values in themselves and among others. We reproduce in flows and chains of flows: perhaps ideology (per Althusser), perhaps the culture machine (per Horkheimer and Adorno), perhaps power relations (per Foucault), perhaps a political unconscious (per Jameson, whose interpretation I favor), but in any sense, the subject reproduces a set of coherent forms forward in time. If so, one may ask what political action can be taken by a subject that is distinct from mechanical reproduction. If intelligent, intentional action is to be taken by a subject, rather than mimetic or mechanical action, it must begin with a conscious, responsible, and sustained rejection of those forces (see Thesis Four). This is *micropolitics* (Deleuze & Guattari, 1987);[40] it is immanent and immediate, local, even under the skin and in the subtexts and textures of breakfast-table conversation, where the force of patterns of ownership and control are felt, seen, tasted, and put to bed beside one's children each night. This is everyday life.

---

[36] The reciprocities Simmel (2004) posits between subject and object, for instance, deserve a close examination in the context I establish here, as in his distinction between desire and value as the subjective relation to objects and the objective relation to objects, respectively (p. 75). I intend to begin this inquiry in forthcoming work on ecocriticism.

[37] One may object, fairly I think, that my account of co-causality in Thesis One through the production of a coherent thing out for a walk, my person, may mislead insofar as it seems to be personal, a matter of and for an individual subject, a consumer or producer. I would like to emphasize that since all coherences are totalities, this account may be used to unpack any object, even as it may strain the imagination to experiment with this metaphor on different degrees of scale: Chile and Iraq nationalizing their natural resources while under surveillance of other nation-states under late capital, for instance.

[38] As a thought experiment, observe the individual and mass behavior (particularly facial gestures and expressions) of enraptured sports fans, megachurch parishioners, fans at rock concerts, and worked-up delegates at political conventions, and reflect: do these ebbs and flows of affect differ in form or function in each context? In each of these instances, a context is made, a space, in which something specific can happen. Is it the same thing each time, or are there meaningful variations, or might these be wholly unrelated phenomena?

[39] Simmel (2004), a thoroughgoing Kantian, reaches similar conclusions on being and value but with a methodological difference—he chooses to posit certain values and certain a certain kind of being *a priori* (pp. 61-63). My decision not to do so, of course, reflects a valuation on my part: a methodological preference for the multivalent, dialogic space of rigorous empirical practice rather than the monologic voice of the metaphysical or theological (see Thesis Seven), corresponding generally to the Bakhtinian novel and epic registers, respectively (Bakhtin, 1981). This is a value judgment I have intentionally made, not an occult law of the cosmos I claim to justify.

Thesis Two

> *The co-causal articulation is a totality. Due to specific causes totalities may be stratified and therefore characterized by internal or external conflict, internal or external control. This conflict is also co-conditional.*

In Anderson (2006) I framed my critique of integral theory as I understood it then, as Ziporyn (2004) framed his own inquiry in *Being and Ambiguity*: to a reading culture long suspicious of totalizing and all-inclusive teleologies and schema, any totality, such as the "whole" of holistic thinking, appears initially to be a relic of a time when books set out to answer all questions, as Spinoza and Leibnitz did in the seventeenth century (see Thesis Seven). The danger I saw then was in reductivity—in *totalizing* a partial view into a universal one, which can only be an ideological maneuver. This led me at the time to effectively reject totalities as analytic tools, a position I intend to reverse now. A brief survey of Marxist method shows that it is possible to think the totality without necessarily being reductive or totalizing about it[41] and, further, that the totality can be a useful concept for unpacking the form and function of virtually anything coherent as *something* in the context of its arising, persisting, and inevitable destruction so long as one takes careful precaution against totalization, satisfying my earlier concern about the use and abuse of totalities in integral thinking. This precaution turns out to be the dialectic, implemented in a particular way.

---

[40] I am preparing a proposal for an integral macropolitics, considering relations of subordination and transformation on the scale of nation and state, as a companion to this essay.

[41] My implementation of Marxism and post-Marxism in the present work, like my appropriation of crypto-Marxism elsewhere (Anderson 2006, 2007), assumes that the holism some Marxists identify is cognate to the holism of integral theory, and functionally equivalent. From this it follows that Marxist inquiry, when properly undertaken, can be seen as already integral, or latently integral, depending on the context. The Marxist totality of social relations, as Burkett (1999) insists, is holistic in nature, as is any coherent praxis:

> Ultimately, a holistic *and* relational approach is dictated by the human requirements of a viable and humanly progressive co-evolution of society and nature […] A holistic perspective, one that breaks down artificial barriers between natural and social sciences *and* between all science and the subaltern members of society, is absolutely essential for such development. (p. 20)

The rest of this section explores one way to read any coherence as a totality in relation to other totalities, beginning with an interpretation of Marx's attempt to frame the problem and working through contributions to Marxist method such as Althusser (1977) and Williams (1977). Most significant here is the way in which a coherence can be understood locally as a set of relationships among others in time, a possibility raised in Thesis One, an understanding that has some consequences for how one may theorize a global transformation.

Marx deploys the totality of social relations formally as a regime of social organization in world history, and in practice as a coherent whole of human practices given to a specific time and place—that is, holistically. Marx[42] analyzes these regimes of organized production as discrete phases of historical development in his essay "Wage Labor and Capital:"

> *Thus* the social relations within which individuals produce, *the social relations of production, change, are transformed, with the change and development of the material means of production, the productive forces. The relations of production in their totality constitute what are called the social relations, society, and specifically, a society at a definite stage of historical development*, a society with a peculiar, distinctive character. *Ancient* society, *feudal* society, *bourgeois* society are such totalities of production relations, each of which at the same time denotes a special stage of development in the history of mankind. (p. 207)

That Marx uses the form of the means of production as the social feature on which he parses the segments of historical time (the *regime*[43] of *private property*)[44] proves to be a significant point of departure for Marx from his predecessors methodologically. In practice, in his writings on history and culture, Marx employs the totality as a coherent whole composed of subordinate processes—in a trope Marx himself employs, a *body*. In this sense of a subject finding a coherent whole in an objective historical moment composed of discrete data points—making order out of an anarchy of material—and where that subject is taken in turn as such a coherent whole that is historically contingent (see Thesis One), Marx's totality can be described as holistic (Burkett, 1999).

In the 1844 *Manuscripts*, Marx describes a dialectic between conditions and consciousness, such that "the *social* character is the general character of the whole movement: *just as* society itself produces *man as man,* so is society *produced* by him" (p. 85). Experiential realities are

---

[42] The citations to Marx in this section refer to Marx & Engels (1978). I include the titles of the essays anthologized in this volume for the sake of readerly clarity in the main text.

[43] The concepts of "regime" and "production" are developed in a more nuanced and detailed manner in Anderson (2007). For present purposes, the conventional meanings of each term suffice.

[44] It should be remembered here that throughout Marx's ouevre "private property" denotes only the private, limited ownership and control of the social forces of production, not one's personal effects or intellectual property (Miliband, 1989). The purpose of overcoming private property is to overcome the separation it creates between those who can direct their productive activity and those who have no practical choice but to do as they are told—full, democratic enfranchisement in all aspects of experience for everyone, the Wilberian "integral embrace" in the social field. Brown (1988), LaClau & Mouffe (2001), and Schweickart (2002) discuss this aspect of Marxist theory as the democratization of the socioeconomic.

productions, inclusive of the means of both consuming and producing. Specifically, this apparent but not strictly necessary homology of the individual and society is a consequence of a necessary social activity, production of the conditions of continued social and biological existence (see Thesis One). The subject, for the young Marx, is homologous to the socius: "Man, much as he may therefore be a particular individual (and it is precisely his particularity which makes him an individual, and a real individual social being), is just as much the totality—the ideal totality—the subjective existence of thought and experienced society present for itself" (p. 86). Both terms, subject and socius, dependently co-determine each other, in a constitutive this-that, that-this causality (see Thesis One). This is significant; following this, one finds that control over one or both of these terms (socius or subject) leads to control over the totality, as much as it can be controlled (Thesis Eight experiments with this possibility).[45] In *The German Ideology*, Marx explains how one of these terms is determined, and how this conditions the other: "As individuals express their life, so they are. What they are, therefore, coincides with their production, both what they produce and with how they produce. The nature of individuals thus depends on the material conditions determining their production" (p. 150). Here, capital chooses first to determine social relations, and thereby determines the nature of individuals, which serves to reproduce the totality on the terms of the dominant, regardless of the objective self-interest of the subjectified—a partial view is literally totalized into the whole.

In "The Jewish Question" (1843), Marx frames the totality of social conditions as such a contradiction of interests (again, in the subject and the polity), beginning with a critique of idealist (theological-Hegelian and materialistic-Feuerbachian) historiography: "History has for long enough been resolved into superstition; but we now resolve superstition into history" (p. 31). But as the state-socius determination suggests—it is not only or at all most significantly historians or Hegelians who mystify the conditions of everyday life. The way everyday people do it, for the reasons they do it, whether they have any control over it or not, is much more significant from the perspective of the totality. "Just as Christ is the intermediary to whom man attributes all his own divinity and all his religious *bonds*," Marx observes, "so the state is the intermediary to which man confides all his non-divinity and all his *human freedom*" (p. 32). While the Savior and the state are clearly terms in conflict here, Marx emphasizes that both are determinate formations "infused with an unreal universality" (p. 34)—in the language of this essay, totalized and reductive—that are ideological ballasts or counterweights to the realities of everyday life for one as a producer under the commodity regime, in which one is degraded "to the role of a mere means, and becomes the plaything of alien powers" (p. 34). In this instance the contradiction within the subject, reflecting that of the society (or the subject-socius assemblage)[46] lies between the state's function as guarantor of human freedom expressed as the interest of the dominant class, which transforms the state into an instrument of its own will-to-power and will-to-profit on one side, and the abstract human freedom for all subjects regardless of class literally prescribed by the state under liberal democracy on the other. For instance, religious practice or affiliation, for Marx, is a "*universal right of man*" (p. 41), regardless of the ideological work of the specific religious institutions, doctrines, and traditions, the explication of which he devotes much of his energy. "The contradiction in which the adherent of a particular religion finds himself in relation to his citizenship," according to Marx, "is only *one aspect* of the universal *secular contradiction between the political state* and civil society" (p. 39). Here, the contradiction is articulated between the interest (will-to-power) of a subject, in the context of religious practice or heritage, or as economic self-interest (class interest), opposed to the state and the status quo. Like a food web, a totality (a coherence) is typically characterized by a conflict of interests in its context and its constitution under capital, not an inherently utopian or "holarchic" order.[47]

---

[45] It should be noted that from this simplistic broad-brush framing of the conditions of subjectivity emerges multiple streams of Marxist scholarship, and not all in agreement with each other.

[46] While I do posit an unnecessary relationship of homology between the subject and its socius, I also follow the mainstream of "Western" Marxist and post-Marxist scholarship that finds a co-causal, co-constitutive, dialectical relationship between them. Working from theoretical positions developed by Gramsci and Lotman, Steedman (2006) proposes a nuanced interpretation of "the microstructures through which hegemony is constructed as identity" (p. 152), a process that constitutes the totality of social relations, emphasizing the role of memory in contemporary ideological processes, which expresses very well what I am proposing in this context.

Marx shows this conflict between liberty as freedom of conscience and one's declension into a position *vis a vis* the state to be itself a contradiction, where "the right to liberty ceases to be a right as soon as it comes into conflict with political life"—sadly, China's oppression of Tibetan Buddhists is but one of many conspicuous examples of such in attempts at Marxist praxis alone (or more properly, Marxist in name)—whereas "in theory political life is no more than the guarantee of the rights of man" and therefore should "be suspended as soon as it comes into contradiction with its *end*, these rights of man" (p. 44). For Marx, the specific matter of religion is a *survival*—a functional fossil from an earlier socioeconomic order—and but a specific case of the tension he explores between private initiative and political contingency. To anticipate a later point in this thesis, Raymond Williams' observation that one can transform one's devotions into a functionally oppositional practice, specifically renouncing one's will-to-capital and instead working for the benefit of the totality (p. 122), a position Williams simply proposes without elaborating, should be taken in this context.

For Marx, universal individual rights are a consequence of a political emancipation that came with the transition from a feudal to a bourgeois regime—the dissolution of the crystallized civil order into a mass of "independent *individuals* whose relations are regulated by *law*" (p. 46). Collective or organizational interest under the feudal system, the interest of the guild or the clergy, becomes the interest of the individual burgher, the individual worker. Marx's solution to the contradiction between the law-bound rights of the individual and the power of the bourgeois state to guarantee those rights while, simultaneously, violating them in pursuit of the interest of the empowered, is to redefine the interest (will-to-power) of the individual, which Marx calls here *human emancipation*—"when the real, individual man has absorbed into himself the abstract citizen" (p. 46). This is the moment when the subject becomes *political* in the sense Marx does not articulate in this early essay: that of becoming organized, building bodies such as feudal guilds, those with like interests into a viable *political* force, just as they are already a viable *productive* force. Worded differently, the task of human emancipation is to build a coherent body out of a muddle of microorganisms in competition with one another so that each microorganism may pursue its own fulfillment, which finally coincides with the fulfillment of each other organism. I call this process *radical democracy* (see Theses Seven and Eight).

---

[47] The view that coherences are conventionally pathological and contradictory, and under capital pathological and contradictory in a particular way, should be contrasted with Wilber's (2000a) view that holons are by nature orderly, of order, in order (natural holarchy)—a distinction to be fleshed out in future work—and compared to the Noble Truth of Suffering in traditional Buddhism.

In a more theoretically developed and historically-oriented document, *The Eighteenth Brumaire of Louis Bonaparte*, Marx analyzes the forces of a historical moment when they prove formative of such a body, mid-nineteenth century France, where proposing that "[m]en make their own history, but they do not make it just as they please; they do not make it under circumstances chosen by themselves, but under circumstances directly found, given, and transmitted from the past. The tradition of all the dead generations weighs like a nightmare on the brain of the living" (p. 595). The totality is not a structure newly born with each phase of historical development; as suggested with the case of religion and human rights, any given moment is a mass of mobilized accretions, products of history with contemporary functions and ideological deployments. Marx demonstrates this principle in his analysis of the social and political forces that led to the *coup d'etat* of Louis Bonaparte in December of 1851.

After it is itself transformed into an instrument of the bourgeoisie, the French state succeeds in transforming the legal structure of France into the very image of the means of commodity production— in Marx's terms "the motley pattern of conflicting medieval plenary powers" are transformed "into the regulated plan of a state authority, whose work is divided and centralised as in a factory" (p. 606). But not all has changed. Some forms and memes remain from the feudal past (survivals), which prove to be of use to the empowered class. For instance, "[h]istorical tradition gave rise to the faith of the French peasants in the miracle that a man named Napoleon would bring all the glory back to them" (p. 608), without regard to the fact that *this* Napoleon had simply fashioned himself as such—*make-believe*. Power changes what it must and uses what it can of the detritus of history available to it. Complicity of interest makes a meme such as this coincidence of names and a concocted genealogy available and of use to power. In this instance, playing along with the charade or forcing oneself to believe until one *does* believe appeals to the peasant who wants to "consolidate" his "small holding" or enlarge it, not to reach past it (p. 609)—will-to-capital, which does *not* integrate the interests of said peasants with the interests of like peasants, "homologous multitudes," who are instead like potatoes lumped into a bag (as in the lumpenproletariat), forming an arbitrary unit not organized, only in proximity to each other. But people are not always or only potatoes:

> In so far as millions of families live under economic conditions of existence that divide their mode of life, their interests and their culture from those of other classes, and put them in hostile contrast to the latter, they form a class. In so far as there is merely a local interconnection among these small peasants, and the identity of their interests begets no unity, no national union and no political organization, they do not form a class (p. 608).

The very forces that determine the totality's conflict-structure can, if determined in a very thoroughgoing way—*overdetermined*, in fact totalized—[48] lead to the organization of an oppositional class. Marx uses the logic of homology to suggest that unintended consequences such as this may be explicable, a strategy later developed most notably by Althusser (1977).

---

[48] This presentation of overdetermination is meant to be introductory and is admittedly simplistic in its structural, rather than processual, presentation. Foucault (1978) offers a correction for this in his program for analyzing power, discourse, and exteriority (pp. 94-96), methodologically and conceptually comparable to the program for ethico-political or "integral" history Gramsci (2000) posits (pp. 193-195).

To this end, Marx uses established, traditional rhetorical and literary tropes—residuals also—in which the subject-socius causal formation is expressed as a homology, the most conspicuous of which is the body politic trope, as old as Thucydides, Plato, and the Hebrew Bible—the bourgeoisie suffered defeat "in its mind and in its body," meaning literally its culture, law, and administration, and its military (p. 605)—and an analogy also common to Renaissance and Enlightenment allegory and psychomachia, that of a house to a psyche.[49] Millions of French peasants live in miserable hovels with no more than three openings—"And windows are to a house what the five senses are to the head" (p. 611), meaning that a head with one opening only (the disenfranchised French) is badly incapacitated for perception, rendered ignorant, literally and figuratively blinded and deafened. Put simplistically, as the subject, so the socius and vice versa, a principle Marx articulates here through a recursive causal logic, by which the French burghers "imposed the state of siege; the state of siege has been imposed on it. It supplanted the juries by military commissions; its juries are supplanted by military commissions" (p. 663). As in the case of class formation, the empowered are in the last analysis doing this to themselves as they do it to everyone, a process Marx presents with skill rhetorically but without precision methodologically in this case. Where Marx leaves off, in near-obfuscation, Althusser picks up.

Specifically, Althusser begins his treatment of the totality of social relations where Marx begins "The Jewish Question," with a demystification of history and the dialectic. According to Althusser (1977), the Hegelian dialectic is primarily *mimetic*—mechanical, repetitive—rather than intelligent, creative, or productive (see Thesis Three).[50] That is, the theological speculations to which purpose Hegel set his project represent not an obfuscation or misapplication of dialectical method but "*the mystified form* of the dialectic itself" (p. 93), because Hegel organizes the totality of concrete determinations of a given polity into a coherent whole in such a way that it can be "*reflected in a unique internal principle*, which is *the truth* of all those concrete determinations" (p. 102), in such a way that ideologically occludes an empirical basis for investigation—ideology posing as metaphysics posing as reason. This internal principle is a "*spiritual principle*, which can *never definitely be anything but the most abstract form of that epoch's consciousness of itself: its religious or philosophical consciousness, that is, its own ideology*" (Althusser, 1977, p. 103). The characteristically Hegelian gesture, then, is to fashion a representation of a totality into a programmatic Providential and metaphysical marionette, which moves dialectically not in response to conditions or verifiable positions but according to an ideological and at bottom political, thus "egoistic," agenda: "arbitrary decisions" (p. 104) made to *resemble* a rigorous dialectic here, but elsewhere made to appear as Providence,[51] as Spirit.

---

[49] Anderson (2003) gives a brief cultural history of this trope as an expression of transformational holism. The allegoric tradition may be yet another cultural matrix from which holism as we know it now in the Anglophone tradition arose.

[50] It is worth remembering in this context that, according to Habermas (1994), recognizably postmetaphysical thinking arises in history as an intervention into Hegel's positions and practices by the generation of Marx, Feuerbach, and Bruno Bauer (p. 39).

[51] I provisionally claim that Wilber's holarchy is one such Hegelian organizational principle (a spatial one), and that Aurobindian evolution is another (of chronology). Wilber's specific debt to Hegelian thinkers (Aurobindo, Gebser, Theilhard) and Hegel himself remains an open question for future inquiry,

Hegel's intervention is the philosophical complement to Bonaparte's political one as Marx presents it in *The Eighteenth Brumaire*—it "produces actual anarchy in the name of order" (p. 617) (see Thesis Seven).

As Marx did, Althusser posits a totality of social relations constituted, under capital, by a contradiction of class interests, where "the Capital-Labour contradiction is never simple, but always specified by the historically concrete forms in which it is exercised" (p. 106). This specificity of articulation is *contingent on* and homologously *expressed as* local causalities—the inertia of traditional conjugal and familial relations, the state, cultural traditions, longstanding prosaic strategies for mitigating the difficulties posed by the need to eat and to sleep in a given place and time, all canalized into concrete forms. Meaning: a moment of racism in a workplace, for instance, articulates the writ-large contradiction of the social totality—a conflict of interests—by means of race and in terms of race, and in this sense is not only determined by one stream of causality but *overdetermined* by multiple causalities, the complex of race and class, and local and global histories (see Thesis One). Further, local *overdetermined* causalities must be understood in relation to the pushes and pulls of the global, which engage with local formations on specific, also historically determined terms (Althusser, 1970, p. 106). That is, a racialized moment of conflict in an Oregon lumber mill is not wholly coherent without the frame of the contingencies of the contemporary world timber economy and the local conditions of everyday life. It is not only personal, nor only racist, nor only local.

A Hegelian, for the purposes of Althusser's argument, would look to subdue a given formation regardless of its determination from its contextualized historical specificity into Spirit—the outcome of this dialectic is assumed before the start, literally taken on faith, such that in a vulgar but real way the contradictions of race relations among late-capitalist producers are made out to be a gesture of Providence, specifically a Hegelian's providential pen (see Thesis Seven). Not so for the Marxist working in good faith. Althusser recognizes that the specific overdetermination of social relations in Russia, for instance, made revolution possible under Lenin, but conditions in the overdetermined totality of Wilhelm's Germany *prevented* the same (p. 106). Methodologically, this means it is indeed possible to think a totality without doing necessary violence to any specific contingency, but it is also possible to botch it, to see a New Age dawning where there is none, or to ideologically foreclose a transformation that might be possible (see Thesis Seven). The terms of open-ended empirical inquiry if rigorously applied prevent this, which is why Althusser emphasizes that in Marxist method "the material life of men explains their history; their consciousness, their ideologies are then merely the phenomena of their material life" (p. 107), regardless of the gender-specific language of Althusser's presentation.

---

as is the applicability of this critique of Hegel to post-Hegelian integralists such as Wilber and his claimed sources (see Anderson, 2006). In many instances, this question will produce complex answer, due to the complexity of some integral projects. For instance, the real contribution of Sean Kelly's integration of Hegelian dialectics and Jungian archetypes on the ground of complex holism in my view is the very useful concept of complex holism Kelly himself puts forward (Kelly, 1993)—which is to say, while Kelly's complex holism as "*dynamic complemantarity*" (p. 106) may have arisen from his reflections on Hegel and Jung, its applicability may extend beyond the problems that may inhere in Hegelian and Jungian thinking, demand comparison to the ecological Marxist holism Burkett (1999) proposes, and may in part and in metaphysical diction anticipate my argument in Thesis One.

It is possible to read Althusser's assertion that consciousness is merely a function of everyday life reductively, so that subjectivity becomes but an epiphenomenon of economic exchange, which amounts to proposing that *all* coherences reduce to epiphenomena of macroeconomic processes—an oversimplification to be sure. To assume so would be to forget that the totality is, as Althusser puts it, "never simple," and instead posit that "material life, the economy—a simple principle which in turn becomes the sole principle of the universal intelligibility of all the determinations of a historical people" (p. 108)—an agnostic but still recognizably totalizing and reductive gesture. The real question is how a determinate social formation, in its totality, has been and continues to be produced (Althusser, 1970, p. 110) and *reproduced*. As I suggested in the example of the lumber mill, this is an empirical, historical question—how is this conflicted and contradictory mode of production articulated in the meat world of causality and prosaica? This is an appropriate response to the challenge of overdetermination, in which anything that is coherent as something is so because it is a product with a limited shelf life, specifically a *something* produced by a complex of determinate causalities, strong among them the will-to-power of those in control of economic (and, concomitantly, political and cultural) production.

Williams (1977) explicates this point as a double entendre: "*no one mode of production and therefore no dominant social order and therefore no dominant culture ever in reality includes or exhausts all human practice, human energy, and human intention*" (p. 125). Williams identifies formations—the *emergent*—within the totality and of the totality in excess of the dominant that are not only irreducible or not directly reducible to the economic base but in some contexts *reverse* the base-superstructure direction of causation that a reductive reading of Marxist theory might insist on. This double meaning expresses simple opposition, dissent, miracles, surprises—and the inexhaustible novelty of ideology's strategic or occasionally accidental mobilization, reterritorialization of memes new and old. For Williams *residual* formations (translators of Marx and Althusser call these survivals) are accretions of anachronistic causalities that have, like invasive species from the territory of the past in the new habitat of the present, evolved to articulate a particular determinate force, dominant or not, as mutations *within* the coherent body, functionally like the emergent or not at all. Williams cites the ambivalent function of religious orthodoxies in liberal democracies as an example–perhaps dominant or complicit here, perhaps oppositional or revolutionary there (p. 122), a position to be distinguished from the religious consciousness that is the ideological social self-fashioning that Althusser diagnoses at the *omphalos* of the Hegelian dialectic, the literal and metaphoric priest who for Marx becomes "only the anointed bloodhound of the earthly police" (p. 613), a critique extended to psychoanalysis in Deleuze and Guattari (1983).

Methodologically, the relevant distinction is between forcing reality to match a reductive and ideological schema, either idealistic (straw-man Hegelian) or economic (straw-man Marxist)—or doing actual inquiry, drawing deductive conclusions from demonstrable premises, preferably in collaboration with others to help prevent errors and overstatements, systematically (see Introduction), which is the Marxist method of historical materialism in its purest form. This amounts to setting theory or method into a dialectical relationship with material realities, and following the inquiry through empirically, not ideologically (see Introduction). The *Aha*! moment this process obtains begins a long and productive transformation in the subject and the object.

That said, one may object that this method, as more explicitly materialist in orientation rather than explicitly holistic or idealistic, may be inappropriate at best to the integral project. Litfin (2003) raises three objections to Marx's method in her argument in favor of a Hegelian-idealistic integral interpretation of history and politics. The first two, "Marx's theory of dialectical materialism is internally inconsistent and ultimately falls back upon the same assumptions as evolutionary idealism" (Litfin, 2003, p. 43) are both predicated on the same error. Litfin confuses Marx's *method* for interpreting phenomena, historical materialism, with his *interpretation* of phenomena, analogous to mistaking the craft of carpentry with a finished piece of woodwork. Absent this distinction, Marx's writings likely would betray a constitutive contradiction between "inert" matter and a progressive, conscious dialectical method—conscious because it aspires to be scientific and subjective,[52] not conscious because it is implicitly Hegelian,[53] as Litfin assumes it must be. Since Marx does persist in distinguishing his object of inquiry (matter and the forces of social history) from his method of inquiry (dialectical materialism and historical materialism), evident from the very fact he develops different concepts for both,[54] the contradiction Litfin attributes to Marx should be attributed to Litfin's interpretation of Marx. This shows that Litfin's first two objections against Marx and Marxism are unfounded. It is unclear which of Marx's texts Litfin refers to, or what credible Marxist scholarship she has consulted in her analysis, which is a significant context for her third objection, that Marx "erroneously universalizes" his critique of societies under capitalism and their structure "to all societies throughout history" (Litfin, 2003, p. 43). This claim is unsubstantiated; Litfin does not cite one instance where Marx makes this mistake (likely because there are no instances of it in Marx's oeuvre, even in his discussions of precapitalist societies), nor does she cite any evidence supporting her claim that Marxist practice is predicated on the same "worldview" as industrial capital (Litfin, 2003, p. 43) and therefore part of the problem rather than a potential part of the solution, as I propose, nor does she show how this objection even if it were coherent might be warranted, that is, germane to the question of historical materialism as a developing method for understanding and transforming the contemporary, global-capitalistic totality. Litfin's arguments for evolutionary idealism in favor of historical materialism as a method for understanding the political and transforming it are incoherent.

This thesis proposes: if something is coherent as something, that coherence can be understood as a totality (a nation-state, a city, a household), and also in relation to other totalities, which do the work of making things coherent to subjects under capital—not just determining, but overdetermining that coherence, which serves to reproduce that totality as constituted in any given moment (its regime) into the future, an insight that informs the rest of this proposal. I do not posit this process as the evolution of conscious Spirit through phenomenal forms, or anything analogous to that, although I do not on principle rule such a thing out as a theological possibility. I do find that both kinds of global phenomena that Litfin (2003) attributes to emergent Spirit, the explosive power of the transformations capitalism has brought to our world and efforts to transform the capital regime into something more socially just and ecologically sustainable, can more plausibly and with less conceptual elaboration be attributed to the contingencies of capital as it has developed since the industrial revolution and the personal needs of everyday people living together—and that an integral response to those global transformations begins not necessarily with Spirit but with everyday people taking a certain kind of responsibility (see Thesis Four).

---

[52] This is also the significance of the popularized Marxist meme of class consciousness, which is an understanding of one's objective situation, without make-believe, such that the totality becomes coherent to a subject, as do one's place and function in that totality. This coming-to-consciousness has more in common with empiricism than with any form of idealism.

[53] If Litfin is correct on this point and Marx is indeed the idealist-by-accident she claims him to be, then her objection to historical materialism would seem incoherent in an altogether different way: Litfin's claim, if correct, would recuperate Marx precisely as a figure of the evolutionary idealism she promotes, which would make her actual rejection of Marx counterstrategic.

[54] This comment of mine contains an entry-level mistake about Marx. Shortly before publication of this essay, the editor of *Integral Review* offered me a chance to revise my error away, but I have chosen to keep it at his suggestion, even to make it more conspicuous by noting it here as a kind of teachable moment: at the instant I find (perhaps legitimate) fault in someone else's treatment of Marx, I produce a mistake of my own. This recalls a familiar lesson on motes, beams, hypocrisy, and responsibility (Matthew 7:5). I trust the reader to find my error and refuse to repeat it.

Thesis Three

> *The coherence arises, persists, and decomposes in time; it can change in time mechanically, or consciously by accumulating developments to a stable regime, or consciously by transforming said regime. Transformation may be necessary to produce responsible results. Theory can help (if responsible) or hinder (if not) any transformation.*

Yuri Lotman observes that changes over time in a semiosphere can manifest in a continuous, predictable fashion—or in a surprising, unpredictable gesture Lotman calls *explosion* (Deltcheva & Vlasov, 1996). For Lotman, the latter tends to open spaces where the uncontrived and novel can develop. I will call changes over time that are predictable, even planned or cultivated, *developments*, and changes that are not predictable and amount to ruptures *transformations*. While developmental models of stages and degrees are useful predictive measures for a multitude of purposes, broadly speaking any one of them is necessarily inadequate to the task of predicting the outcome of any transformative intervention. As Sorel (1961) demonstrates in his critique of early Marxist scholarship,[55]

> it must not be expected that the revolutionary movement can ever follow a pre-determined direction, that it can be conducted according to a master plan like the conquest of a country, that it can be scientifically studied other than in its own development. Everything about it is unpredictable. (p. 253)

Because the mainstream of integral thinking so far has emphasized the developmental aspects of change[56] over different scales of time— Gidley's (2007) macrohistory and synthesis of multiple developmental models is one particularly useful example—I will continue here to explore some ways in which transformation differs from development to flesh out how both modes work, with an eye toward making space for the practice of new values by means of transformative intervention[57] (see Theses Four and Five).

---

[55] Mandel (1977), working from Trotskyite presuppositions, proposes a similar distinction to Sorel's but in softer terms: "The (quantitiative) changes which constantly occur in the given mode of production, through adaptation, integration of reforms and self-defense (evolution), are distinguished from those (qualitative) changes which, by sudden leaps, produce a different structure, a new mode of production (revolution)" (p. 18).

[56] For instance, Wilber (2000a) claims that "something novel and emergent" arises due to a dialectical process of transcendence through coupling and recoupling of extant forms (p. 50), a mechanical process

Development is necessary to maintaining any sane social or psychological order (literacy, health, labor), as well as helping to establish the possibility for real intervention. One must become competent before one can accomplish effective critique, for instance, and this becoming-competent is a developmental process[58] (see Thesis Four). But development can and often does also function to maintain a pathological psychosocial regime as well. I begin distinguishing development from transformation with the perhaps counterintuitive position of economist Michel Aglietta (2000) that it is development or evolution that maintains the food-web conflictual structure of the totality.[59] According to Aglietta, "[s]tructural forms evolve with the material transformations of the mode of production. This capacity for evolution is precisely what ensures social cohesion under the domination of an antagonistic relation of production" (p. 189). Development is *an accumulation of means for holding the totality together as it is, under the regime at hand*. It is increased depth, capacity, productivity, force, or the "potential" for increase of any of these, or the accumulation of means to induce an increase. In the case of development as it is understood in contemporary popular discourse on economics, under a regime of accumulation and consumer power, development is a social means of ensuring growth in a productive capacity through legitimized consumption—in short, it is the rise and expansion of a consumer class (Aglietta, 2000, pp. 71-72). One of the subjective developments of the wage relation, the "fragmented consciousness" that is said to characterize modernity, is not only an epiphenomenon of fragmented work roles, as Marx suggests in his early writings; like these work roles, this fragmentation of consciousness is a functional part of the social order under capital (Aglietta, 2000, p. 154), as internally conflicted subjects seek out in the realm of consumption some relief or resolution within themselves, leading to transactions that feed capital back into the machine as productive labor and as commodity consumption. In short, conflicted beings in a conflicted world engage in "retail therapy," some of which could hypothetically offer actual therapeutic benefit (see Thesis Eight). For the regime of capital, this represented a positive development, a way to increase accumulation, even though it is hardly in the best interest of those plugged into this desiring-machinery. Following this one can see that consumption is

---

of accumulated variation and complexity. For present purposes, I call the kind of mechanical change Wilber describes *development*, and the kind of intentional and creative intervention I prescribe *transformation*.

[57] Some integral thinkers, Wilber most conspicuously, have consistently expressed strong reservations about the value or possibility of transformations as ruptures (Wilber 2003). The present essay differs on this point but not without qualification.

[58] For instance, the brilliant, demanding pedagogies of Ilych (1973) and Friere (1993) could both be regarded as developmental plans designed to bring about significant and desirable transformations subjectively and socially. My point is not that development is somehow "bad"—on the contrary, it is invaluable—but that it can be useful to any regime—it is *ambivalent* in this sense—and it is limited in scope.

[59] Modern history shows that most large-scale transformations go horribly wrong sooner or later as well, due to a complex of irresponsibility, outside intrusion, and logistical problems. My larger point for the purpose of this inquiry is that transformation offers a specific opportunity to accomplish something that development cannot approach, if and only if handled with care.

predicated on a desire to consume, that desire is manufactured or "machined" in the Deleuze-Guattarian patois, and that subjects under capital are made to desire the social and subjective order *as it is*, not as it could be (Jameson, 1981; Braidotti, 2006; Anderson, 2007). *As it could be*, in my view, ought to be the purpose of integral praxis—to produce work that benefits the whole, from bottom to top. And that, in my view, demands a transformation, but not just any transformation.

Products—explicitly representational or not—arise in space and time due to causes and conditions, which are legible to a greater or lesser extent in the form, function, and characteristics of the product, as are the imputed desires and needs of the intended consumer. This means that any given product, including any and all materials we might think of as integral, such as the present inquiry or Wilber's *Integral Life Starter Kit* for instance, has a specific relationship with its mode and moment of production. Mary Ellen Pitts's (1990) holographic paradigm is perhaps the first experiment to think a properly integral hermeneutics through. Pitts reads texts and cultural artifacts as partial or complete refractions of experienced realities. Because the mind (for Pitts) apprehends its context or horizon holographically, it produces materials, "flickers," that are related to world-stuff on a holographic principle (p. 83), where the refraction reproduces in a distorted way the whole moment of its production.[60] The contours of that distortion, I suggest, may reveal something useful about a mind of a given moment of production, as will the product, the text or "flicker" (see Thesis Six). Following this, what I call "flickering" is a mechanical process, mechanical in both the Gurdjieffian and Deleuzian senses: as with the subjective aspect of a coherence's co-creation, it happens unconsciously, automatically (see Thesis One); it may reflect an uncritical or automatic identification of the maker's interests with the regime in control of the given formation. I posit that *flickering is legible in coherences in the way things are coherent and made coherent.*[61]

But products are not always born only of mechanistic, Malthusian, or Machiavellian modes of causation. Some—cultural products most explicitly but not absolutely nor exclusively—are also *productions of consciousness*, of compassion, articulated with greater or lesser competence. What I call *mimicry*[62] includes conscious, intentional behaviors designed to ingratiate one with a given regime. Consider here any formalities of dress, dining, greeting, and forming the body, and the consequences of their abrogation. As I hope to show, some products and intellectual trends are nothing more than metaphorically using the correct fork at the correct time at the dining table of Empire, proving one is worthy to speak for (socially sanctioned) Eternal and Timeless Values.[63] This theorist, by investing in a given product or ideology or "ism," identifies his or her interests as primary, and seeks promotion of them by means of integrating them with those of the regime through this strategic investment—like the petty farmers Marx described in the *Eighteenth Brumaire* (see Thesis Two) or like the *homo academicus* reproducing in his scholarship the values of his position and his aspirations in the academic institution (Bourdieu, 1988). Since developmental models are committed to keeping the regime at hand intact by improving it by change over time, there is a danger of mimicry, intentional or otherwise, in the potential ideological investments in and of developmental practices.
